In consequence of these applications, a considerable number of documents was forwarded to the Commissioners, giving much valuable information respecting the condition of primary and agricultural education in several continental countries, and in the colonies above mentioned. A list of those documents will be given in the volume (VIII.) which will contain the *Miscellaneous Papers* of the Commissioners. The information contained in many of those about Primary Schools has already been published in the Reports of other Commissions or other public documents; such of the unpublished documents as contained any information of a general interest will, we believe, be published in the volume referred to.

In several of the countries from which we received information respecting agricultural education, there exists no provision for teaching it in primary schools. Such agricultural schools as exist there belong to the class of secondary or higher schools. Thus in Holland there is only one agricultural school, that of Gröningen (*De Landherishoudkundige School*), which is supported by a private society, without aid from the State. In France there are three high schools of agriculture, Grignon, Grand Jouan, and Le Saulsie, corresponding to the schools of arts and manufactures of similar rank at Chalons, Angers, and Aix, and the veterinary schools of Alfort, Lyon, and Tolouse. By the law of the 15th March, 1850, elementary agricultural instruction could be introduced into primary schools. On the 12th July, 1853, a commission was appointed to—1. To designate to the Minister of Public Instruction the teachers to whom such instruction might be confided; 2. To prepare the instructions which should be addressed to teachers; 3. To look after the practical instruction in agriculture to be given in these schools, and to propose such measures as would insure its success. On the proposition of the commission, and with the advice of the academic councils, the Minister of Public Instruction was to authorize the exceptions which it would be necessary to make in the hours, &c., of the schools where the teaching of practical agriculture was to be tried. M. Fortoul, Minister of Public Instruction, issued a circular to the rectors of academies on the subject, on the 18th April, 1855, in which he mentions that the experiments made in different parts of the Empire to connect the practical teaching of agriculture with primary schools were successful. On the 18th of February, 1856, Mr. Fortoul made a report to the Emperor, suggesting the removal of certain restrictions as to the number of teachers in a school, so as to permit agricultural instruction to be given by persons not belonging to the teaching staff of the school.

We have had no information as to how far this system of agricultural education has been extended, what success it has attained, or its present condition. In the absence of such information we consider that it would be going beyond the scope of our inquiry to describe the agricultural colleges of Grignon, Grand Jouan and Le Saulsie.

We have received information about several of the State agricultural colleges of the United States, but as no system of agricultural education in connexion with primary schools has yet been organized there, we cannot for the reason just stated with respect to the French schools, give any account of them here.

The only countries where the attempt to teach agriculture, either in special schools of the primary class, or to introduce it directly into the ordinary primary schools, has been thoroughly carried out, are the South German States—Baden, Wurtemberg and Bavaria—and Austria. In each of these countries a more or less complete system of agricultural education, embracing all degrees from the university to the primary school, is in operation. Although our inquiry has reference to a great extent to the latter class of schools, we could not give a satisfactory account of the lower grade of agricultural education without describing the whole system. In the following pages we shall accordingly describe all classes of agricultural schools in each of the States above-named. Instead of giving translations of all the documents, we think it better to give so much of the information they contain, as would possess interest out of Germany, sometimes as a simple translation and sometimes as a condensed statement, or as a brief summary.

1.—Agricultural Education in the Grand Duchy of Baden.

The following Memorandum was sent, May 9, 1868, by Mr. Baillie to Mr. Gordon, Her Majesty's Minister at Stuttgart, and by him forwarded to Lord Stanley for the use of the Commission.

Almost the whole of the Agricultural Education is in the hands of the State, and entails an annual expense of 36,395 florins, or about 1½ Kreuzer per head of the population.

The Circles Mosbach, Offenburg and Lörrach pay at the present time contributions to the Agricultural Circle Winter Schools; the Circles Mannheim, Villingen, Waldshut, and Freiburg will probably follow their example in the course of this year.

These are, however, not private but mixed institutions, in support of which the State bears the chief burden, and also the Commune of the place where the school is situated.

In the higher branches of agricultural science, instruction is given in the two Universities Heidelberg and Freiburg, by the Professors of Political Economy.

In addition to this an agricultural class was established in 1864 in the Polytechnic Institution at Carlsruhe.

II.

Agricultural primary instruction is now given in seven schools, containing altogether 135 pupils. These pupils belong almost exclusively to the peasant class. The instruction takes place almost entirely in the winter months, and comprises agriculture and cattle breeding, natural philosophy, arithmetic and geometry with surveying. It is more practical in its character than systematic. The subjects of the lectures must have direct reference to agricultural industry. They become in this way intelligible and attractive, and the short period of five months suffices for laying a solid foundation upon which studious young people may advance in general improvement and knowledge.

The results of this method of instruction introduced for the first time in 1865, are very satisfactory, and have led to imitation not only in the Grand Duchy, but also in Bavaria and Switzerland. The number of these institutions will probably have increased to eleven next year.

One school (in Carlsruhe) is supported without State assistance. In two schools the State and the Communes (Heidelberg, Messkirch) contribute; another school is chiefly maintained by a foundation under State superintendence, the Commune (Bühl) also contributing something. The other remaining schools are supported conjointly by the State, the district and the Commune of the place where the school is situated.

The State nominates and pays the Chief Instructor, and employs him in the summer months for inquiring into the agricultural condition of different parts of the country, for making reports, and for lecturing in farmer's meetings (*Wandervorträge*).

III.

(*a*). *The Grand Ducal School for Gardening* in Carlsruhe (*Gartenbau Schule*), in connexion with farming on a landed property of 160 *Morgen*, with a corresponding number of head of cattle, (horses, horned cattle, pigs, and bees).

(*b*). *Cultivation of Pasture Lands* (*Wiesenbau Schule*).—A course of instruction, the nature of which will be seen in inclosure No. 13, is given every year during three months in the theory of irrigation, draining, &c., for the training of foremen. This branch of agriculture has been hitherto conducted exclusively by professionals employed by Government. The number of pupils is between twenty and thirty. Each of them receives during the three months a daily allowance of forty-two Kreuzers, and an allowance for writing and drawing materials.

(*c*). *Obstbau Schule.*—School for cultivation of fruit. The same person who teaches gardening is bound to give instruction in the cultivation of fruit. This latter is annually offered gratis to upwards of thirty persons who propose to take up the planting, improving, and management of fruit trees as their profession (*Baumwärter.*)

Those who are without means receive an allowance for three journeys from home to Carlsruhe and back, as the instruction is given at different times in the course of the year. The diligent pupils receive a prize at the end of the year. All receive compensation for the actual work which they have performed.

(*d*). *Course of Lectures on Cultivation of Fruit. Obstbau Kurs.*—Popular School Teachers and other persons of mature age receive gratis in the course of the summer a short course of instruction in the theory of the cultivation of fruit. About twenty persons attend these lectures.

(*e.*) *Hufbeschlag Schule.* School for Horse Shoeing.—The Veterinary Surgeon of the National Stud, consisting of about 100 stallions is at the same time the smith who shoes the horses, and has to give instruction in this business to young smiths during some months. They are taught the anatomy of the hoof, the ordinary practice of shoeing, and the way to prepare shoes for diseased or deformed hoofs. According to the result of the final examination, the pupils receive a prize of ten, twenty, or thirty florins.

The instruction is not given in regularly fixed intervals, but the pupils may attend at any time. There were six last year.

The documents enclosed with the foregoing memorandum enable us to give some further information about the winter schools.

Each school is managed by a local committee or council of management consisting of :—*a.* Three members of the Circle or district assembly (*Kreis Versammlung*); *b.* two members of the Communal Council (*Gemeinde Rath*) of the place where the school is situate; *c.* of the agricultural teacher, who, however, is not allowed to be present during the discussion of matters concerning himself.

The members of the managing council are elected for three years. If a vacancy occurs among the members elected by the Circle or district assembly when the assembly is not sitting and is not likely to meet for some time, the authorities of the Circle may appoint a representative until the next meeting of the assembly.

The council of management elect from among the members a president, a vice-president, and a secretary, who hold office for three years.

The council of management has the right to invite other experienced persons to its discussions.

If the place of an elected member becomes vacant the president or his representative must immediately cause a new election to be made, the result of which must be made known to the Minister of Trade, the authorities of the Circle and the council of the Commune.

The Minister of Trade appoints the principal teacher and notifies the appointment to the council, who instal him in his office. The assistant teachers are appointed by the council.

The plan of instruction and school organization is drawn up by the council, which sees that the rules laid down are strictly adhered to. The council determines the amount of school fee to be paid, and the cases where its payment may be remitted; it supports the teacher in the maintenance of the discipline of the school. It arranges for the holding of the examinations in the presence of all the members. It provides for the due, payment of the salaries of the assistant teachers, the necessary fittings and furniture of the schools, and the proper supply of the necessary teaching appliances, the repairs and cleansing of the schoolhouse.

The council of management submits the plan of instruction and school organization to the Minister of Trade for approval, and communicates its estimate of the cost of maintaining the school and its contracts with the assistant teachers to the authorities of the Circle and the Communal Council.

The time fixed for the public school examinations must be notified to the Minister of Trade, the authorities of the Circle, and the town council, at least fourteen days before the event.

The school council manages the school property and for the purpose appoints an accountant.

The school council elects one of its members to visit the school from time to time to ascertain its condition and to report the result of his inspection at the next meeting of the council. Every member of the latter has, however, the right to visit the school at all times, and if he chooses, to report his observations at the next sitting of the council.

At the end of each school year the school council publishes an official report on the agricultural winter school containing a printed invitation to the public to attend the school examination.

The school council meets once every three months, and at other times whenever pressing business requires it. The chairman summons the meeting, and cannot refuse doing so when at least three of the members wish it. The meetings are private. Three members, including the president or his representative, form a quorum. The president decides according to the votes of the majority of the members present; in case of an equality of votes the chairman has a casting vote.

The minutes of the school council are recorded by the secretary in a minute book, and are signed by the members who were present at the meeting. After each meeting the president sees that its decisions are carried out. All written documents emenating from the school council must be signed by the president or his representative. Receipts and orders require two signatures.

Urgent and routine business which does not require the sanction of a formal meeting of the council may be transacted by the president or by his representative or by another member charged with its execution. The matter must however be formally noticed at the next meeting.

The following summary of information regarding some of the schools is taken from the programmes for the winter of 1867–68 :—

Agricultural Winter School of Messkirch.—This school was opened on the 4th November, 1867, and the first session closed with a public examination on the 30th March, 1868. The session of 1868–69 opened on the 19th October. During the first session thirteen scholars entered and of these eleven attended. The Government provide the principal teachers, the locality the assistant teachers, the schoolhouse fittings, furniture and school appliances. Any boy, native or foreigner, over fifteen years of age may attend the schools. The fee for the session is fourteen florins which must be paid to the director within the first four weeks of the session. The scholars provide their own board and lodging, but the director may recommend certain houses.

The teaching staff consists of—1, the agricultural teacher, who is director and also travelling lecturer of the Circle of Konstanz; 2, the teacher of the Trade School (*Gewerbe Schule*); 3, the teacher of the primary school (*Volkschule*); and 4, the district veterinary surgeon.

The collections for the illustration of the lectures consist of :—

1. A small library of agricultural books, journals, illustrations of horses, cattle, implements, &c.
2. Models of the most important implements.
3. A herbarium, containing about 100 species of grasses and fodder plants, and about 100 weeds.
4. A collection of seeds, containing cereal and leguminous garden and commercial seeds.
5. Artificial manures.
6. A collection of horse shoes for normal and abnormal hoofs.

The apparatus provided by the town of Messkirch for the *Gewerbe* or Trade School is used for teaching physics, chemistry, and geometry.

The Winter School of Offenburg was also first opened on the 4th November, 1867; and the session closed on the 4th April. There are five teachers—1, the agricultural teacher, who is director; 2, the principal teacher of the local gymnasium; 3 and 4, two teachers of the *Real*-School; and 5, the local veterinary surgeon. The apparatus, collections, &c., consisted in 1868 of the following:—a microscope, twenty-one models of agricultural implements, the necessary chemical apparatus and re-agents, a collection of eleven artificial manures, a geological collection, a collection of soils, a fruit cabinet containing fifty models of the best kinds of fruit, a collection of seeds, a collection of ears of corn, &c., an herbarium of fodder grasses and herbs, and weeds, osteological preparations, a collection of seventeen horse shoes, surveying instruments, maps, agricultural books and journals. The number of scholars who attended the first year was nineteen, of whom eight resided with their parents and the others lodged in the town. Besides the regular scholars four farmers received instruction in agriculture on one day of the week. Every week excursions were made after school hours when time and weather permitted to neighbouring farms. Similar excursions were frequently made on Sunday afternoons. In order that the scholars might be looked after out of school hours also, a room was hired in which the different agricultural journals were put on the table. The scholars could there exchange ideas upon what they had heard in their lessons, and they were also accustomed to converse freely once or twice a week when the teachers and scholars came together. Four stipends were also given during the session, and the school fee, of twelve florins, was remitted by the authorities of the circle in the case of poor and industrious scholars.

The Winter School of Mühlheim.—The town council of Mühlheim gave the former Town Hall for the use of a winter school which opened on the 4th November, 1867. The council also fitted it up, provided the necessary appliances for teaching and heated the rooms during the winter. The authorities of the Circle granted an annual sum of 400 florins, with the express condition that 100 florins should be given to assist poor scholars to pay the school fee which is ten florins for the session. The town council could also remit the fee. There were eighteen scholars the first session, of whom three dropped off. The teaching staff consists of—1, the agricultural teacher; 2, the principal teacher of the Trade School, a teacher from a middle class school in the town; 4, an assistant teacher; and 5, the district veterinary surgeon.

The collections and other teaching appliances consisted of a collection of models of implements, seeds, cereal grains, artificial manures, chemical apparatus and re-agents; a library of fifty volumes, four agricultural and amusing journals, two charts of useful and noxious animals, a geological map of the Rhine valley, a map of Baden, and numerous illustrations of horses, cattle, fruit, grapes, and implements. These collections were chiefly provided by the town. The Minister of Trade presented several valuable agricultural works. It was proposed to add a collection of rocks, soils, grasses, and models of fruit in wax during the session of 1868–69.

The *Winter School at Bühl* had four teachers and fifteen scholars during 1866–67, of whom two were obliged to leave during the session.

The *Winter School at Heidelberg* had five teachers and seventeen scholars, who paid a school fee of fifteen florins, and of whom two were attending a second year.

The *Winter School of Buchen* had five teachers and forty-eight scholars, who paid a school fee of ten florins. The collections and other illustrations for lectures are similar to those of Messkirch, Mühlheim, &c.

One of the first winter schools established was that of Carlsruhe, which was opened the 1st November, 1864. It has four teachers, and had five scholars the first year, ten the second year (1865), eleven the third year (1866), and twelve the fourth year (1867). The head of this school is also head of the rural horticultural school (*Landwirthschaftliche Gartenbauschule*). The collections, apparatus, &c., of the latter are available for the

instruction of the scholars of the winter school, who have also the advantage of seeing their theoretical instruction practically illustrated on the farm of 106 *Morgen*, belonging to the horticultural school, as well as on the meadows, hop-garden, orchards, byres, &c., belonging to it.

In order to give an idea of the character of the instruction given at these winter schools, we subjoin the syllabus of the lessons given in two of them, namely, Mühlheim and Carlsruhe.

Syllabus of Course of Instruction of the Winter School of Mühlheim.

Agriculture.—Generalities, formation of the soil, properties and classification of soils, reclamation, tillage, the plough, fallow, rotation, manures, arrangement of the plots under the several crops, legal regulations, drainage, irrigation, book-keeping.

Breeding and rearing of animals.—General notions, races of cattle, selection of breeding animals, pairing, rearing. Theory of nutrition, feeding and feeding stuffs, rearing and stall-feeding, pasturing or grazing, use. The chief points on the breeding and rearing of horses.

Chemistry.—Chemical laws; chemical combinations; non-metallic simple bodies, light and dense metals; the more important acids, bases, and salts. The more important processes and combinations, plant life. Experiments.

Veterinary Medicine.—The exterior parts of the horse and cow, dentology, obstetrics, warranty.

Physical Geography.—Determination of the mean temperature of the day, month, and year. Isotheral and isothermal lines, climatal relations—their causes and actions on vegetables. Thunder storms, &c.

Popular Mechanics.—Measurement of force by kilogramme-metre, and horse power. Direction and action of forces,—the parallelogram of forces; the lever and combinations of the lever; wheel and axle,—wheels and wheel combinations,—transmission of motion. The inclined plane, screw, wedge, application to mechanics.

Geometry.—Direction of bodies and right lines, angles, trigons, tetragons, polygons, calculation of the contents and surface of bodies, calculation of areas. The circle and its parts. Practical examples. Excursions for practical geometry,—land surveying, calculation of areas, simple levelling.

Animal and Vegetable Physiology.—Generalities on Physiology: organs of motion, organs of the senses, organs of nutrition, review of the animal kingdom. Distinguishing characteristics of the individual classes of animals. Detailed description of animals useful and injurious for agriculture. Generalities on morphology and plant life. The Linnæan system. Description of the more important plants.

German Language.—Exercises in dictation. The principles of the formation of words and sentences, and composition. Introduction to composition, business letters, &c.

Arithmetic.—Decimal fractions, extraction of the square and cube roots, compound rules (calculation of work, interest, discount, partnership, &c.)

The lessons on agriculture are given eight times a week; on the breeding and rearing of animals seven times a week; on chemistry five times a week; on veterinary medicine three times a week; on physical geography twice a week; popular mechanics twice a week; geometry twice a week; zoology and botany three times a week; German language three times a week; arithmetic three times a week.

Besides the regular lessons, excursions are given from time to time for practical instruction, and twice a week conversations of the scholars in the presence of the agricultural teacher take place.

Syllabus of the Lessons given at the Agricultural Winter School of Carlsruhe.

Time Table.

	Time.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.
Forenoon.	9 to 10	Veterinary medicine.	Agriculture, . .	Agriculture, . .	Veterinary medicine.	Book-keeping, .	Veterinary medicine.

A. General Agriculture.

I. *Climatology.*

Idea; temperature, its distribution in the day and year, its measurement—the thermometer. Atmospheric pressure—the barometer.

Aqueous precipitation: the rain gauge. Direction and force of the wind: the wind vane.

Constitution of the atmosphere; sunshine, rain, formation of clouds.

Distribution of heat over the surface of the earth in general; the equator, poles, tropics. Irregularities in the distribution of heat: oceanic currents, height above the sea, exposure to the winds, neighbourhood of large masses of water, nature of surface, different winds, character of the soil.

Agricultural zones. Laws of thunder storms.

II. *Study of the Soil.*

1. Formation from rocks, decomposition of plants and animals; decay, local debris, alluvial deposit. The most important rocks, the simple minerals contained in them; classification of soils geologically.
2. External character of the soil; mechanical analysis of the soil, and proportion of clay in it; relation to water, air, and heat.
3. Character in depth: soil and subsoil.
4. Chemical character,—constituents of soils.
5. Decrease of fertility. 6. Increase of fertility.
7. Testing the soil: origin, mixture (humus, lime, acids).

III. *Manures.*

Constituents of plants,—combustible and non-combustible.

Action of manures, solvents, increase of temperature, loosening, addition of important nutritive matter.

Mineral manures: bones, marls, gypsum, potash, salts.

Vegetable manures: green manures, malt dust, oil cake, ashes, soot, turf.

Animal manures: stable dung, liquid manure, human excrement, sheep manure, guano, bone meal, animal offal, mixed manures (compost).

IV. *Tillage and Implements.*

Loosening and pulverizing, carting in manure, seed-sowing, extirpation of weeds.

The plough, the harrow, the grubber, the clod crusher and roller.

Requirements of ploughing, qualities of the plough, description of the plough, depth plowed, width plowed,—the furrow. Single and double ploughs, subsoil ploughs.

Sowing machines,—different modes of sowing. Hoeing implements, drill harrow, horse-hoe, double mould board plough. Implements for cutting down crops: grass and corn mowers. Potato plough. Implements for collecting and saving crops: haymaking machines, horse-rake, power machines, thrashing do., winnowing, do., carts and other instruments of locomotion. Potato-washing machines, root-cutting machines, chaff-cutters, meal grinding mills, oil cake breakers, &c.

V. *General cultivation of crops.*

Seed, sowing, planting; grain crops, tuberous and bulbous plants; selection of good seed, depth for sowing, quality of seed, distribution, time of sowing. Nursing: extirpation of weeds.

Harvesting: time of harvesting, harvest work, produce of the harvest, storing of the crops.

B. Special Cultivation of Crops.

I. *Grain Crops.*

Cereals. Pulses.

II. *Fodder Crops.*

Meadows and pastures, species of grasses, &c., that grow in them; description of the plants. Graminaceous fodder plants, leguminous fodder plants, herbaceous fodder plants, tuberous plants, culinary vegetables, roots.

III. *Industrial Crops.*

Textile plants, oil plants, aromatic and other plants used as condiments. Dye-plants, other industrial plants.

I. Breeding, Rearing, &c., of Animals, Generally.

1. *Breeding.*

Zoological classification of domestic animals, agricultural classification of domestic animals. Character of races, origin of races. Laws of hereditary descent. Breeding in and in, pure breeding, original animals. Development of the young from the embryo to birth.

2. *Rearing.*

Constituents of the animal body, constituents of plants and their nutritive values, consumption of food and digestion. Determination of the quantity of feeding stuffs, supporting or sustaining fodder, increasing or fattening fodder. Determination of the quality of feeding stuffs. Relation of other feeding stuffs to hay, determination of their nutritive value. Preparation of feeding stuffs. Feeding of animals, food-mixtures.

II. Breeding and Rearing &c., of Animals, Specially.

A. *Cattle.*

1. Nature of the ox.—Origin, length of life, propagation, structure of the body. 2. Races. 3. Breeding,—selection, age, pairing, pregnancy, parturition, suckling of the calf, &c. 4. Rearing,—food, preparation, stall-feeding. 5. Use,—milk, fattening, working.

B. *Pigs.*

Treated in the same way as cattle.

Book-Keeping.

I. *Preparation.*

1. Inventory of the produce and articles required for a farm. 2. Valuation of produce. 3. Valuation of land and fixed capital. 4. Cost of horse labour. 5. Cost of manual labour. 6. Opening a set of books. 7. Notions on book-keeping by double entry.

II. *Management of Books.*

1. Division of the books: *a.* Estate books; *b.* Fixed capital books (buildings, implements, cattle); *c.* Floating capital books (cash, stores, labour).

2. Use of the books. *a.* The ledger; *b.* Landed property or estate book; *c.* Fixed capital (cattle,—inventory and valuation of; young stock register; implements,—inventory and valuation). *d.* Floating capital (cash, stores, crops, &c., registers, green fodder list, dung list, milk register, labour account).

The Ledger: Debtor and creditor accounts, closing accounts—balance sheets.

Carrying out a complete example with day book, cash book, &c., and ledger.

Chemistry.

a. Inorganic Chemistry.

Simple bodies, acids, bases, neutral bodies; oxygen, combustion, decay, oxidation.

Hydrogen: Water, its constituents and impurities, temperature of spring water, influence of the composition and temperature of the water used in watering; importance of air in water, and of water in air. Distillation of water.

Nitrogen: Formation of nitric acid and ammonia from organic matter, their relation to the nutrition of plants, behaviour in the soil; management of dung, value of the nitrogen in different bodies, calculation of the value of artificial manures, peat, wool dust and woollen rags, leather, horn shavings, malt dust, oil cake, bone meal, Peruvian guano, Chili saltpetre.

Sulphur: Sulphuring of plants; sulphurous acid, its action on casks and on wine, bleaching. Sulphuric acid. Sulphuretted hydrogen,—its occurrence. Disinfection.

Chlorine: Art of disinfecting, danger of the injudicious use of chlorine in disinfecting. Hydrochloric acid.

Phosphorus: Detection, poisonous character, gives dangerous wounds. Phosphoric acid,—occurrence, artificial manures, calculation of the money value of the latter.

Carbon: wood-charcoal, animal charcoal, carbonic acid, occurrence of foul air in cellars, carbonic oxide—its injurious action, loss of heat by its production, proper heating.

Silica.

Potassium and potash—importance for plants; difference of action of ashes, crude lixivated salt, and concentrated salt, potassic chloride, potassic sulphate, calculation of concentrated manures. Potashes, injurious action of caustic ley. Treatment of white fabrics. Saltpetre. Sodium: common salt, Chili saltpetre, glass, water-glass.

Lime: burnt lime, calcic hydrate, damp of new houses. Detection of lime in the soil and in water, manuring with lime; marl, burnt lime, soap-boiler's lime, gas-lime, and tanner's lime. Gypsum, phosphate of lime.

Iron: disadvantages of iron in water used in watering. Detection of iron water. Zinc: injurious action of zinc vessels. Zinc-white. Lead: water carried in leaden pipes—disadvantages; bad earthenware. Copper: copper vessels, danger to health when uncarefully used; blue vitriol or copric sulphate. Mercury: corrosive sublimate, danger of using old railway sleepers for fuel [because this salt was formerly used for preserving wood].

b. Organic Chemistry.

Distinction between organic and inorganic bodies. Putrefaction. Decay of vegetable and animal bodies. Bleaching. Preservation of vegetable and animal substances. Management of Dung.

1. Nitrogenous Bodies: flesh-formers, protein bodies; albumen—properties, occurrence, importance in nutrition, antidote for metallic poisons; casein, legumin; treatment of milk. Gluten, treatment of meal and flour and the baking of bread. Muscular fibre—flesh. Gelatinous tissues—skin, hair, horn, bones, silk.

2. Non-nitrogenous bodies: starch, woody fibre, sugar, fermentation wine, distillation of spirit. Formation of vinegar, treatment of wine. Fat, stearin, soap, glycerin. Importance of the protein bodies, of the hydrates of carbon (starch, sugar), of the fats and salts for nutrition. Nutrition of animals.

Physics.

General properties of such bodies. Expansion. The Baden and French measures of length and capacity. Gravity; German and French weights. Density or specific gravity. Importance of the determination of the density of potatoes, milk, spirit, grape juice, &c.

Capillary action, in coarse, fine, loose, and dense earth, in wood, &c. Endosmose—Relation to the nutrition of plants and animals. The lever, equal armed (the balance), unequal armed. Wheel and axle. The pulley. The inclined plane. Centrifugal force.

Transmission of motion by bands and cog-wheels. Friction. Expansion of gases. Blowing fan. Syphon, pumps, &c.

Heat,—expansion of bodies by heat. Importance of the expansion of water when it becomes ice. Motion of air in rooms. Influence of colour of bodies on their absorption of heat. Good and bad conductors of heat.

Botany.

Distinction between minerals, plants, and animals. Cells. Monocotyledonous and dicotyledonous plants—distinction in root and leaves. Roots, spongioles, concentration of the soil-liquid, and quantity of manure. The stem,—aërial and subterranean, bark, liber, cambium, sap, wood, and pith. Cause of the annual rings. Difference between slow and quick growing wood, splitting of the bark—precautions against. Importance of the cambium layer.

Buds: multiplication of plants by cuttings, offsets, layers. Branches, grafting.

Leaves. Importance and activity of leaves in the growth of plants. Freezing of plants. Relation between leaves and roots.

Flowers. Androgynous, monœceous, and diœceous plants. Artificial and natural fructification. The seed—Germination: external conditions, temperature, air, depth at which the seed is put in the soil; action of light (potatoes, malt).

Production and motion of the sap in plants.

Diseases of plants. Causes of diseases in general. Etiolation, smut, granular and fatty smut, red rust, ergot, honeydew, grape-dew, potato disease.

Vegetable enemies of cultivated plants; 1, fungi; 2, parasites,—broom-rape (*Hanfwürger* or *Hanftod*), [Orobanche major], dodder (*Flachseide*), [Cuscuta Europœa], miseltoe.

Animal Physiology and Zoology.

Cells in fat, Albumen, milk.

Organs of motion, Bones, muscles, nerves. Organs of perception.

Organs of nutrition. Nutrition.

The most important, useful, and injurious animals.

Mineralogy and Lithology.

Importance of external form, colour, hardness, and chemical composition as means of recognising minerals.

Carbon,—the diamond, coal. Qualities of good coal, and of good turf.

Silicon,—characteristics. Rock crystal, Quartz, agate, flint, &c.

Potassic compounds; Stassfurth salt. Sodium;—common salt, Chili saltpetre.

Calcium,—characteristics. Limestones, marbles, chalk, lime, fluorspar, gypsum, apatite. Magnesium,—magnesia.

Aluminium,—alumina, alum, clay.

Feldspar. Feldstone, mica, hornblende, oxide of iron; slate, granite, gneiss, syenite, basalt, sandstone, marl, clay, lös [geological clays and gravels of a certain age], tuffa, vegetable soil.

Arithmetic.

Common and decimal fractions; easy business calculations, such as calculations of quantities and prices of goods, conversion of one kind of money into others, calculations of interest, written and *viva voce*.

GEOMETRY.

The straight line; the division of the straight line. Erection of perpendiculars by means of the circle. Angles; division of angles; multiplying and transferring of angles; construction of different triangles; parallelogram; regular polygons. Calculations with the measures of length of Baden; conversion into French measures and the converse.

Calculation of surfaces bounded by right lines and by the circle. Conversion of areas measured by the standard of Baden into French, and the converse. Conversion of figures into others of equal area: *a.* by construction; *b.* by calculation. Practical exercises in the field in measurement of straight lines and in the use of the circumferenter; surveying of rectilineal surfaces.

COMPOSITION.

Of commercial compositions; the business letter, and the usual form of letters; small notes of goods, accounts, receipts, attestations, notifications, contracts, reversal of contracts,—partly from dictation and partly from materials supplied. For practice in the free use of language, short narratives, &c., are given. Exercises in orthograpy are combined with these.

GEOGRAPHY.

Baden and its boundaries, its extent, the character of its soil; rivers, divisions, towns, railroads.

ANATOMY.

The Study of the Individual Organs.

Especially osteology, the muscles, the tendons and ligaments, the intestines, the vessels.

The Functions of the Organs,

Namely: digestion, the blood and its circulation, respiration, the senses. The functions of the brain and spinal chord, the nerves.

The Study of the Exterior of the Body.

Division of the body, dentology. On position and manner of going; walking, trot, gallop, jump, pace, half pace, canter.

On the skin; the hair and its colour.

The exhibition or viewing of animals,—in stall or stable, on an open place, at markets.

Examination of the individual parts.

HORSESHOEING.

LEGAL MEDICINE.

The chief defects, warranty, time for which warranty is given. Plaints in suits at law.

OBSTETRICS.

Diagnosis of pregnancy; treatment during it; duration of gestation in different animals. Preparation for birth, symptoms of approaching birth; assistance in parturition.

2.—AGRICULTURAL EDUCATION IN WURTEMBERG.

LETTER of Mr. GORDON, Her Majesty's Minister at Stuttgart, to LORD STANLEY.

Stuttgart, April 24, 1868.

MY LORD,—With reference to my dispatch, No. 63, of the 7th inst., I have the honour now to transmit copy and translation of a communication which Herr von Golther, the Minister of Public Instruction, has most kindly addressed to me, with the information that he had promised me respecting the schools for agricultural education supported by the State in this country, and enclosing a number of documents and reports referring to the same.

From the above will be found that there are four different classes of Agricultural Schools in Wurtemberg.

I. The Agricultural College of Hohenheim, near Stuttgart, which is the highest of these establishments, and is, of course, the only one of its class in the country, answering as it does to the University for other branches of learning.

II. The so-called "Agricultural Schools" (*Ackerbau Schule*) intended for the instruction of the sons of yeomen landed proprietors in the more simple processes of country economy. Of these there exist four, one for each circle, so as to render attendance at the same convenient to the various districts of the kingdom.

III. The Vinicultural School at Weinsberg, for instruction in the culture of the vine, hop, fruit trees, and horticulture generally. And lastly,

IV. The so-called "Agricultural Supplementary Schools" (*Landwirthschaftlichen fortbildungs Schule*) established all over the country, and yearly increasing in number, so that it is hoped that ere long every village will possess one. These schools are intended for the youth of the lower peasant class, and are opened chiefly during the winter evenings, when instructive lectures, readings, and explanations of various sorts connected with agricultural and horticultural topics are held for the benefit of those who choose to attend in the public school-room or common hall of the place.

The printed documents communicated to me by the Minister, and also transmitted herewith, are each of them referred to and explained in His Excellency's letter under the numbers marked upon them. I have not considered it necessary to cause such a mass of matter to be translated, being uncertain as to the greater portion of it being required by Her Majesty's Commissioners for Inquiry into the State of Primary Education in Ireland. But if translations of any of these documents are desired, they can easily be furnished on the same being returned to me, or full titles thereof being sent to me.

I have the honour to be, &c.,

Lord Stanley, &c., &c. (Signed) G. R. GORDON.

TRANSLATION of NOTE of His Excellency HERR VON GOLTHER, Minister of Public Worship and Instruction, to Mr. GORDON, Her Majesty's Minister at Stuttgart.

SIR,—I have the honour, in fulfilment of the wish you lately communicated to me, to have reports, &c., concerning the regulations of the Agricultural Schools, &c., of the Kingdom of Wurtemberg, to transmit herewith in enclosure the necessary papers for your information and further use.

For better guidance I beg to add the following :—

I. The Agricultural Institution in Hohenheim, founded in 1818, was by an ordinance of the Ministry of Public Instruction of 9th September, 1865, entirely re-organized.

Enclosure 1 contains these new organic arrangements for Hohenheim, as will be seen from section 8 of these arrangements. The institution in Hohenheim contains—

A.—As Schools :—1. The Academy of Agriculture and Management of Forests (Upper School). 2. A School of Husbandry. 3. A School of Horticulture. 4. Several courses of instruction for different branches of agriculture.

B.—As practical business :—1. The management of the estate. 2. The plan of experiments in agricultural chemistry. 3. The forest district.

The details of these different institutions and professions must be obtained from the arrangements themselves.

For the more particular carrying out of the latter, the following statutes for the students of the Academy contained in enclosure 2, which also contains, in an appendix, regulations for the visiting and use of the collections of the Academy :—Concerning the final examination of the students of agriculture; concerning the giving of prizes to the students of the Academy; concerning the dues to be paid for students of the Academy.

The prospectus in enclosure 3 contains a short summary of the intentions, plan of study, means of tuition, conditions of reception, and other things relating to the Academy of Hohenheim.

In enclosure 4 is a special summary of the lectures, experiments, and practical working at the Academy of Hohenheim; and under enclosure No. 5 is added a plan of the lesson hours for the summer term of 1869.

More particular information about the School of Husbandry (after reference to sec. 64 of the new arrangements of the Hohenheim institution of the 9th September, 1865) is to be found in the special organic arrangements for this School of Husbandry annexed under enclosure 6, as well as in the house and school ordinance for the pupils of the said school contained in enclosure 7.

Details concerning the School of Horticulture in Hohenheim (*vide* sec. 80 of the new organic arrangements of 9th September, 1865) is contained in the special organic arrangements for the School of Horticulture sent as enclosure 8, to which the remark must be made that the house and school ordinance (enclosure 7) for the pupils of the School of Agriculture is in a similar way made use of with regard to the pupils of the School of Horticulture.

As regards the Hohenheim Estate management, enclosure 9 contains the plan of management of Hohenheim for the year 1868.

In connexion with the Lower Argicultural School, under the name of the "School of Husbandry," in Hohenheim, especially intended for sons of persons of the class of small farmers, &c., were founded, in 1842, two schools of like sort in the country districts far removed from Hohenheim, viz., in the Jaset district (Ellwangen) and in the Danube district (Ochsenhausen), which measures were followed in the year 1850 by the founding of a fourth School of Husbandry in the district of the Black Forest (Kirchberg), so that now each of the four divisions of the kingdom is provided with an Agricultural School of this class.

The arrangements for the newly-founded Schools of Husbandry in Ellwangen, Ochsenhausen, and Kirchberg, as well as the instructions for the superintendents and teachers of the same, as well as the house and school regulations for the pupils of these Schools of Husbandry are contained in enclosure 10.

III. In order to unite with this a proper management of the cultivation of the vine, so important as it is for Wurtemberg, a school for vineyard cultivation was lately founded in Weinsberg, which in all essentials is organized after the approved model of the Schools of Husbandry. This institution is especially intended for young men of the class of vineyard gardeners, and has moreover to deal not only with the culture of the vine, but also with what concerns the wine press and cellerage; and, on the other hand, also with the cultivation of fruit, vegetables, and hops, and with the culture of the soil as garden in general.

The particulars concerning the founding of the School of Vine-culture, the organic arrangements of the same, and concerning the opening of the new institution in February of the current year, are to be obtained from enclosures 11 to 13.

IV. In order finally to extend an improved agricultural education to the most distant circles of the peasant population of the country, the so-called Agricultural Improvement Schools, and such like establishments for agricultural improvement, were called into existence, concerning the formation of which information can be obtained from enclosure 14.

By an ordinance of the Ministry of Public Instruction of the 1st February, 1866, a copy of which is to be found in enclosure 15, these institutions and establishments were newly organized, and mention may be made of—

1. Those obligatory winter evening schools, forming a sort of continuation of the *Volksschulen*, and therefore under the inspection of the higher officials of the *Volksschulen*, in which, besides other instruction, agricultural instruction is added as an optional subject.
2. The self-established voluntary agricultural improvement schools.
3. The agricultural evening classes for grown-up people.
4. The reading clubs; in connexion with which the travelling teachers of agriculture sent out into the country parishes are to be mentioned.

The more particular arrangements for the carrying out of the new organization of agricultural instruction, &c., is contained in the enclosed publication (sent as enclosure 16) of the office, forming the immediate bureau of inspection of agriculture to the local agricultural societies charged with the care of these institutions and establishments.

What extensive improvement in agricultural knowledge has had in Wurtemberg in the last few years, the annexed annual reports (enclosures 17 and 18) of the winter 1865–66 and the winter 1866–67 show. (The annual report for the year 1867–68 is not yet made out).

V. Finally, for an example of the position which the Agricultural Schools take in the organism of the Wurtemberg Institution for Public Instruction generally, as well as for the summary of attendance, and other

statistical matters connected with these institutions, the statistical publication of the Ministry of Public Instruction of 22nd May, 1867, including the years 1865–66, annexed as enclosure 19, is the latest publication. The statistical statement of the Wurtemberg Institutions for Public Instruction for the years 1866–67 now being made up, I hope shortly to have the honour of sending to you.

I hope that I have met your wishes in the above communication, but should you wish for further information on any point, it will be a pleasure to me to give it.

With, &c., &c.,

Signed, GOLTHER,
Minister of Public Worship and Instruction.

Stuttgart, April 11th, 1868.

The following summary of such information contained in the documents referred to in the foregoing letter of his Excellency Freiherr von Golther, as we consider of use in connexion with our special object, will sufficiently explain the nature and extent of the provision made in Wurtemberg for agricultural instruction.

THE LAND AND FORESTRY ACADEMY OF HOHENHEIM.

The farm, gardens, farm offices, factories, &c., at Hohenheim, like those at Weihenstephan in Bavaria, are utilized for several different educational purposes, as has been pointed out by his Excellency, Herr von Golther. Before describing the character and extent of the instruction given in each school, we shall first mention the extent of the farm and the character of the gardens, collections, and other appliances.

The farm of Hohenheim, which lies about 500 feet above the Stuttgart valley, and distant from that city about 5 miles, contains altogether a little over 971 Wurtemberg acres, of which 615 are cultivated under rotations of crops, a little over 149 acres are in permanent pasture; the nursery for forest trees contains about 21½ acres, the experimental field, inclusive of roads and paths nearly 30 acres, the fruit tree nursery nearly 17 acres, the hop garden nearly 4½ acres, the botanic garden nearly 14½ acres, the kitchen and flower garden about 3¾ acres; the vineyard nearly half an acre; the practising field for the students about 1¾ acres; the remainder is under buildings, roads, plantations, water, paddocks, &c.

The land under crops is cultivated so as to show all the different systems of rotations. The experimental field is divided into 96 divisions of about ¼ of a Bavarian acre each, upon which as many experimental crops are annually grown.

The botanical garden contains all the plants of economic value and of such others as are requisite for the illustration of the botanical lectures. The garden is divided into four divisions, two of which contain each ½ a Bavarian acre, and two of 1¼ acres. A suitable rotation of annual plants is kept up on the two latter divisions. The two smaller divisions are occupied by the perennial plants. The first division contains the whole of the older and newer cereal grasses, consisting of 140 species and varieties. The second division contains fodder grasses, and other useful and noxious grasses, industrial plants, medicinal plants, perennial oil, fibrous and dye-plants. The third division contains herbaceous fodder plants, viz., many species of Trifolium, Medicago, Melilotus, &c.; this division contains also the different varieties of cabbage and root plants. The fourth division contains leguminous plants, oil plants, plants used as condiments, &c., fibrous and dye-plants. The belt of trees surrounding these divisions contains the trees of importance for the botany of forestry. The leaves of the mulberry hedge which surrounds the garden serve for feeding silkworms.

The gardens are intended to illustrate fully the cultivation of culinary vegetables, bush fruit, dwarf and stone fruit, the use of forcing frames for seedlings and melons, &c. The vegetables, &c., grown, are sold on certain days of the week to the inhabitants of Hohenheim. The flower garden contains two conservatories and several forcing frames. It is fully organized for teaching the scholars of the Horticultural school. In order to simplify the management it is let to the gardener of the institution.

The terrace in front of the principal buildings has four rows of standard fruit trees—two rows of fully grown and two of young bearing trees. Along the walks of the terrace are 65 different kinds of pears and apples. These trees serve to familiarize the students with the characters of the several varieties of fruit. The apricots, peaches, &c., are in the gardens above-mentioned.

The fruit tree nursery is divided into 12 divisions, each about a Bavarian acre in extent. On each of these about 9,000 young trees are planted. The normal number of trees annually yielded is about 6,000. The period of nursing lasts from 8 to 9 years, after which the cleared ground is subjected to a three or four course rotation, *e.g.* 1, potatoes, 2 and 3, Italian rye-grass, 4, turnips, &c., allowed to seed, before the land is again planted with trees.

Besides the bush and dwarf fruit trees in the gardens already mentioned, there are considerable plantations of fruit trees, chiefly for cider and perry, along the roads and alleys, and in some closed ground. When counted in the summer of 1863, the number was 4,227, of which 2,325 were apple-trees, 1,497 pears, 316 plums, 25 cherries, 63 walnuts, and 1 edible chestnut.

Wild timber plantations exist on the banks of the ponds and streams, and in marshy places along the roads. There are in addition two enclosed plantations, one of 2½ acres, and of 3 acres. There are two periods of felling, one at the end of five years, and one at the end of fifteen years. Besides the mulberry hedges of the botanic garden, the experimental field, and the catchment ponds, there is a large plantation of mulberry trees near the silk-worm house.

Live Stock.—About 16 horses, and from 10 to 18 draught oxen, are generally kept. The horses are chiefly mares for the purpose of breeding—the foals being reared according to circumstances for from 2 to 4 years. In February 1868 the establishment had, exclusive of draught oxen, 86 head of cattle, of which 3 were full grown bulls, and 38 milch cows. The cattle were principally of the Swiss breed of the Siemen Thal, derived from the original animals purchased in 1835, 1838, and 1844, which were subsequently bred in and in. In 1865 some bulls were purchased for freshening the blood. In 1866 a Durham bull was also purchased for the purpose of increasing the fattening qualities of part of the herd. There are also among the herd a few crosses of the Siemen Thal cattle with the Alpine and Limpurger races.

The sheep consisted in the beginning of 1868 of a flock of 747 coarse long wool sheep, 20 fine combing wool Merinos, a flock of 72 of the breed known as the Electoral, and 13 South Down sheep.

Chemico Technological Workshops.—These comprise the following:—A sugar factory, a distillery, a brewery, a starch factory, arrangements for the preparation of vinegar, the preparation of wine, and the drying of fruit. The object of these works is to illustrate the instruction in Rural Technology.

The sugar factory possesses apparatus for the direct extraction of the beet juice by the hydraulic press, and for Dombasle's system of maceration, both worked by steam. The work of the factory is confined to the production of clayed raw sugar in the months of November and December. In connexion with the factory there is an arrangement for the revivification of the animal charcoal.

The brewery is calculated for the production, by different methods of brewing, of from 50 to 70 *Eimers* of beer in the months of January and February.

The distillery is worked with potatoes, grain, molasses, and brewery residues, &c. It is calculated to produce daily one-half an *Eimer* of spirit. The period for which it works is regulated by the objects of the instruction.

The arrangements for the preparation of starch, wine, and vinegar are only used for small demonstrations.

Establishment for preparing Flax.—In order to spread the knowledge of the method of preparing flax in use in Belgium and Holland, a small establishment has been organized in which the flax grown is retted in various ways in summer and scutched and dressed during the autumn and winter.

The Agricultural Implement Factory.—The object of this establishment is not only to make all such implements, &c., as have been recognised as useful, strong and cheap, and diffuse their use in the country, but also to serve as a propagating school for clever workmen in this branch. The factory also provides and repairs the implements used on the farm. The master of the factory works it on his own account, and delivers the implements and machines after they have been accurately tested, at a fixed price, into a special store belonging to the institution, whence the sale is made for the account and under the guarantee of the school. The factory employs from 30 to 36 workmen, two or three of whom are exclusively employed in the making of models of agricultural implements.

Establishment for Rearing Silk-worms, and Silkwinding.—The silkwinding factory transferred here in 1848 uses not only the cocoons produced at Hohenheim, and for which the mulberry trees above mentioned are grown, but also those purchased from native growers.

Mills.—There are two mills worked by the water from the stream which bounds on one side the property. The upper one was sold in 1855; the lower one, belonging to the school, is fitted up with modern machinery, and affords a complete example to the students of the working and management of mills.

The Forest Revier of Hohenheim embraces about 7,000 Wurtemberg acres of woods, partly belonging to the State and partly to Communes, and offering various conditions of soil, cultivation and management. One of the two professors of Forestry is always manager, and consequently the fullest opportunities are afforded to students of becoming acquainted with practical forestry.

I. The Academy.

The objects of the Academy are: 1. To provide a thorough professional education in agriculture and forestry for future landed proprietors or farmers or agents of large properties, so as to enable them to farm and manage estates and forests with success and from the present scientific standpoint. The forestry students are so taught as to be able to meet the requirements of the public and private services. 2. To afford an opportunity to officers of the civil service in certain departments a special knowledge of agriculture and forestry, and of those branches of technical industry directly connected with land. 3. As a training school for such as intend to become teachers of agriculture or forestry. 4. And finally, in addition to those teaching functions, to aid in the further progress of scientific agriculture by experiments made at the experimental station, observation and literary activity.

The period of study for forestry students is two years; agricultural students who go to Hohenheim well instructed in all the fundamental and collateral sciences may attend the whole of the principal lectures in one year, the fact that many cannot devote more than one year to such studies being taken into account at the academy. It is, however, necessary to spend two years there when the student is not thus prepared. The study year begins in the winter session; this lasts from the 15th October to the 9th March, and the summer session from the 1st April to the 15th August.

The subjects of instruction are the following, arranged according to the session in which it should be attended, supposing the student spent four sessions or two years at the academy:—

Agricultural Subjects.	Session in which it should be attended.
A. History and literature of agriculture,	IV.
B. Production:—	
General cultivation of land and of plants, including the drying of land, especially the subject of thorough drainage,	I.
Agricultural machines and implements,	II.
Special cultivation of plants,	II.
In special courses.	
Cultivation of hops and tobacco,	IV.
Viticulture,	IV.
Fructiculture,	IV.
Kitchen gardening	IV.
Cultivation of meadows and pastures,	I.
General production of animals,	I.
Breeding, &c., of horses,	IV.
The exterior of the horse,	IV.
Breeding, &c., of cattle,	II.
Breeding, &c., of sheep,	II.
Wool,	II.
Smaller farm animals,	III.
Sericiculture,	III.
Agriculture,	III.
C. Working and management:	
Agricultural working,	III.
Agricultural valuation, with exercises in the draughting of plans of working and management,	IV.
Agricultural book-keeping,	III.
Working and management at Hohenheim,	III.

	Session in which it should be attended.
D. Agricultural technology:	
In connexion with these lectures, demonstrations are given by means of the apparatus and machinery above-mentioned. Practical exercises in the valuations of farms are also given, excursions, &c.	

Forestry Subjects.	
A. Encyclopædia of forestry (with special reference to the collateral study of agriculture).	
B. History and literature of forestry,	III.
C. Production:—	
Forest botany,	II.
Climatology and study of soils for foresters,	I.
Cultivation of woods,	II.
Protection of woods,	II.
Use of woods, forest technology,	III.
D. Industry:—	
Valuation of timber and other products,	III.
Organization of forests,	III.
Forestry management,	III.
E. State forestry:—	
State forestry in a special course,	III.
Forestry laws of Wurtemberg,	III.
The practice of forestry business,	III.

Forestry Subjects—*con.*	Session in which it should be attended.
F. Agricultural Encyclopædia for foresters:—	
In connexion with this course, demonstrations are given in different Forestry Reviers, in the Botanic Garden, in the forestry collections, as well as practical exercises in valuation, large and regular smaller excursions, &c., as in the case of the agriculturists.	
Fundamental and Collateral Sciences.	
A. Political economy,	I.
B. Law,	IV.
C. Mathematics:—	
Arithmetic,	I.
Algebra,	I.
Plane geometry,	I.
Solid ,,	II.
Trigonometry,	II.
Practical geometry,	II.
In connexion with this course, regular exercises are given in land surveying and building.	
D. Natural sciences:—	
Mechanics,	I.
Experimental physics,	I.
General inorganic chemistry,	I.
,, organic ,,	I.
Agricultural chemistry,	II.
Analytic chemistry,	II.
Introduction to geognosy,	I.
Geognosy,	II.
Introduction to botany,	I.
Anatomy and physiology of plants,	III.
Pathology of plants,	III.
Special botany,	I.
Anatomy and physiology of domestic animals,	I.
General zoology,	II.
Special zoology,	IV.
Introduction to microscopical investigation,	IV.
In connexion with the lectures on natural science, the students work in the laboratory, get demonstrations in the conservatories, and on the experimental fields of the agricultural experimental station, and make regular botanical and geognostical excursions, &c.	
E. Veterinary sciences:—	
Materia medica, and prescribing,	I.
Pathology and therapy of domestic animals,	II.
Veterinary obstetrics,	III.
Horse-shoeing,	III.
In connexion with the foregoing lectures, the students receive veterinary clinical demonstrations.	
F. Technical subjects:—	
Agricultural architecture,	IV.
Plan drawing,	I.–III.

These several subjects are taught by ten principal professors, six assistant professors, two repetiteurs and five assistants. The principal professors are those of mathematics, of general and agricultural chemistry, of geognosy and botany, of zoology and veterinary medicine, three professors of agriculture, including the director, a professor of rural technology, and two of forestry. The assistant professors are those of political economy and law, (the secretary), agricultural buildings (an architect), practical exercises in agriculture (the farm inspector,) fructiculture and gardening (the head gardener,) apiculture (the president of the *Ackerbau* school), agricultural book-keeping (the accountant). The repetiteurs are: one for agriculture, who is also assistant farm inspector or steward, and one for forestry. The assistants are those of the professors of mathematics and physics, chemistry, geognosy and botany, zoology and veterinary medicine and the assistant of the farm inspector in his capacity of assistant teacher of the academy.

Besides the farm, byres, gardens, woods, workshops, already described the agricultural and forestry academy of Hohenheim, possesses the following collections, &c., for the illustration of the scientific lectures and the practical teaching of certain branches of science.

1. A collection of models with tools, machines, and arrangements connected with agriculture, forestry, technology, &c., partly of full size and partly on a reduced scale. This well-known collection is perhaps the most extensive of its kind in the world.

2. A complete mineralogical cabinet, a collection of soils, a rich exhibition of economic and forestry seeds, herbaria, phytomical and pathological articles, artificial imitations of flowers and sponges, pomological models, a zoological collection, anatomical preparations, &c., and finally a rich collection for illustrating horse-shoeing.

3. A chemical laboratory, arranged for allowing the students to work at practical chemistry.

4. A mathematico-physical cabinet, containing the instruments necessary for mathematical, mechanical and physical lectures.

5. A library of several thousand volumes, the use of which is open to students under certain conditions.

6. A reading-room, in which twenty-four newspapers, and an equal number of scientific journals are taken in and open to all belonging to the academy.

The books of the farm, &c., in the accountant's office are also open to the students for instruction.

Examinations.—Written and oral examinations are held at the end of each session. Participation in these examinations is entirely voluntary, a number of subjects for special examination, both in the fundamental and professional sciences, are, however, prescribed as obligatory. Those students only who submit to the final examination are entitled to a diploma for industry and knowledge when departing.

Prizes.—In order to promote industry and encourage a scientific spirit, especially to excite to independent research, a subject for a prize essay is proposed to the students of each profession—agriculture and forestry. The author of the best essay receives fifteen Wurtemberg ducats, and of the second ten. The prizes are declared on the 25th November, the anniversary of the foundation of the Academy, at a public assembly in the Castle of Hohenheim.

Candidate students must be at least eighteen years old. With the consent of the academic council, students may be admitted between the ages of sixteen and eighteen years. Natives of Wurtemberg, who propose to become foresters, unless they have passed the examination for entrance into the university, must undergo a special examination in the German language, arithmetic and plane geometry. This examination takes place in Hohenheim, from four to six weeks before the commencement of the winter session. The candidate has also to present a certificate as to his previous career, in order to enable an estimate to be formed of the character and extent of his preliminary education. If he has been previously at a university or high school, he is bound to bring a certificate as to industry and good conduct, and finally, unless of age, he must produce a certificate from his parents or guardians, sanctioning his attendance at the Academy.

Foreign forestry students and native and foreign agriculturists are not obliged to pass an entrance examination; it is however to be understood that they are fit to understand and follow with profit the lectures, and that they have had some experience of practical agriculture.

Native students of agriculture pay 100 florins a year, for which they have free admission to all the lectures; foreigners pay 300 florins the first year, and 200 for the second and subsequent years. The native students of forestry pay 60 florins annually, foreigners 200 florins. Forestry students cannot, however, attend the agricultural course, with the exception of the lectures on the breeding, &c., of horses, unless they pay the higher fees charged to agriculturists.

Persons who wish to make themselves acquainted with the institution, or with certain parts of it, may be admitted by the director, or in certain special cases by the academic council, as guests for a period not exceeding four weeks. Their reception as a rule does not take place at the beginning of a session. Natives pay for their room, bed, &c., and for attendance at all lectures, twenty kreuzers a day, foreigners one florin

Each student has a room of his own, which is heated in winter. A special rent is charged for certain rooms. Each room is provided with the most necessary furniture, including, in the case of foreigners, beds, bed-clothes, and towels. Native students must provide themselves with the three last-named articles. The allocation of the rooms takes place through the office of the secretary, and generally in the order of entrance.

Each student has to provide himself with food, which he may do either with the "Foodmaster," (*Speisemeister*) of the academy, or with some other person in Hohenheim, or in the neighbouring villages. In order to cover the cost of at least the plainest food, 80 florins per session must be lodged with the accountant, for which monthly accounts are furnished. In case of the illness of a student the academical *Speisemeister* is bound to furnish him with whatever food he may require, or which may be ordered by the physician, either in his own room or in the hospital of the establishment, even though the student does not take his ordinary meals from him. The cost of board may be estimated at 36 kreuzers, or 10 silber groschen = 1 shilling a day. There is, however, opportunity for obtaining it for a less sum; and also those who can afford to expend more may do so.

Each student has to provide himself with light and fuel: the latter can be procured from the stores of the academy at cost price, and is delivered free even to students not residing in the college buildings.

The establishment provides the necessary service for which each student pays 1 florin a month during the summer session, and 1 florin 36 kreuzers in the winter session.

Each student has to contribute 2 florins half-yearly for the support of the reading-room.

The Chemical Experimental Station.

This institution, though not, strictly speaking, part of the academy, is intimately connected with it. Like all the other branches of the whole establishment it is under the director, the immediate management being, however, in the hands of a committee, (*Curatorium*), of which the director is president and composed of the professors of chemistry, agriculture, botany, and zoology and veterinary medicine, and a chemist specially attached to the station. The Minister of Public Worship and Education may, however, on the proposition of the director appoint other members of the committee, the object of this power being to associate with the scientific men when desirable specially qualified practical agriculturists.

The object of the chemical experimental station is to contribute to the advancement of the science and practice of agriculture by investigations in natural science combined with agricultural experiments in the field and stall, as well as the noting and comparison of the observations thus made. It includes a special chemical laboratory, an experimental field, experimental stalls for practical experiments in feeding, and a glass house for experiments in the vegetation of plants.

The "Curatorium" meet at certain fixed periods to discuss and determine the plan according to which the experiments are to be made. The carrying out of these determinations is intrusted to the professors of chemistry and agriculture and the station chemist, who are called the "Directors of experiments." These are of co-ordinate rank, except that the professor of chemistry has the immediate management of the station and conducts the correspondence, &c. In certain cases, however, the other professors above named may take part in carrying out the orders of the "Curatorium."

The directors of experiments are, each within his own special sphere, perfectly independent; but they are expected to zealously co-operate with each other for the common object.

The professor of chemistry can employ the assistant and servants of the principal laboratory for any work he may require in connexion with the Station. A special assistant is provided for the professors of agriculture and the station chemist.

School of Husbandry.

(*Ackerbauschule.*)

The object of the School of Husbandry of Hohenheim, like the other schools of the same kind at Ellwangen, Ochsenhausen, and Kirchberg, is principally to afford to the sons of peasants the opportunity of learning the practice of rational husbandry at the same time that they are taught the fundamental principles of the sciences upon which it depends. It is under the director of the whole establishment, but is directly managed by the head teacher, who is named by the King. The subjects taught are divided into two classes—collateral or helping sciences, *e.g.*, the German language, with exercises in composition, arithmetic, geometry with drawing and land surveying, natural sciences, and veterinary medicine; and agricultural, *e.g.*, 1, cultivation of plants, climatology, knowledge of the soil, general and special cultivation of plants, including fructiculture and viticulture, rotation of crops, cultivation of meadows and pastures; 2, breeding and rearing, &c., of animals—cattle, sheep, horses, pigs, bees; 3, rural industries; 4, the arrangement and working of small farms, agricultural accounts. The detailed syllabus of these subjects need not be given as they are treated in general as in similar institutions in Bavaria and Baden, in treating of which we have given examples.

The head teacher gives the theoretical instructions, both agricultural and scientific, except veterinary medicine, which is given by the professor of that subject in the academy.

The practical instruction is given by the Agricultural Inspector or Steward of the Hohenheim farm, under whose direction they perform all the ordinary work of the farm. He also arranges that they shall in turn be employed at other work, such as gardening, management of the working horses and oxen, &c., which are usually intrusted to the scholars in their last year.

The school is calculated for twenty-five scholars for a three years' course, so that there are from eight to nine vacancies annually. Candidates to fill those vacancies must have completed their seventeenth year, must be strong enough to perform the regular work of a farm and in good health. They must know reading, writing, and arithmetic, and possess sufficient natural aptitude to be able to profit by lectures. They must also have acquired sufficient skill in the use of ordinary agricultural implements and in performing ordinary agricultural operations, to be able to at once engage in farm work. A competitive examination in reading, writing, and arithmetic, and in practical farm-work is held annually at Hohenheim. Those found best qualified at the examination are selected.

The ordinary scholars of the School of Husbandry receive free instruction, food, lodging, bed, fire and light, stationery, &c., and even in certain circumstances a contribution towards the cost of their clothes. In cases of ordinary illness not exceeding fourteen days they also receive free sick treatment.

Besides the ordinary scholars who engage to follow a course of instruction for three years, a few guests who desire to practise certain operations, or to acquire information about certain portions of farm management, are admitted in summer. Such casual scholars pay 3 florins a month for lodging, bed and instruction. They receive board in return, for they work like the regular scholars, and are subject to the same rules as to discipline, &c.

If a scholar leaves the institution before the end of the three years without permission, or is sent away for misconduct, he must pay back to the institution the cost of his board, &c., according to a fixed tariff. On entering the institution the scholar gives security for such payment.

Periodic examinations are held in each subject of instruction, at which the director is present whenever he is able. Towards the end of each school year a general examination is held in the presence of the director. At the end of each school year rewards are given to the students in proportion to their work, their behaviour, the results of the examination, and their time in the institution. Besides these rewards, prizes are given to the scholars most distinguished for industry, progress and behaviour. When a scholar leaves the institution at the end of his course, he may receive a certificate from the director on the proposition of the head teacher and the agricultural inspector, setting forth his good conduct, industry and qualification, and also mentioning any prizes he may have received.

The School of Horticulture.

The object of this school is to train young men to be gardeners by suitable theoretical instruction combined with practise in flower and landscape gardening, fructiculture and market-gardening. Like the School of Husbandry, this school is placed under the director of the whole establishment, the direct management being in the hands of a president named by the King on the proposition of the Minister of Public Worship and Education.

The instruction given at the School of Horticulture is partly a preparatory scientific one, *e.g.*, culture of plants, drawing, arithmetic, geometry, natural sciences, composition, and land surveying; and partly strictly professional, *e.g.*, culture of flowers, kitchen-gardening, management of nurseries of fruit trees, cultivation of fruit trees, trade and landscape gardening. This instruction is partly theoretical and partly practical exercises in the gardens of the institute, which are specially connected with this school.

The instruction, both preparatory and prefessional, is given by the two gardeners of the Hohenheim establishment, with the exception of the instruction in arithmetic, geometry, natural science, composition, and land surveying, which these scholars receive in common with those of the School of Husbandry from the head teachers of the latter.

The course of instruction is fixed at one year. The average number of scholars is fixed at 6, so that 6 new scholars enter annually. Guests are also admitted for three months when there is accommodation.

Candidates for admission must be over 17 years of age, strong, and in good health, so as to be able to perform all the ordinary work of a garden. They must be able to read, write, and calculate well, and if possible have some skill in drawing, and possess sufficient capacity to understand and profit by popular lectures on gardening and the collateral sciences. They must have passed three years in gardening or in a School of Husbandry, or if they belong to the class of vine dressers, have occupied themselves with viticulture and gardening during three years, of which one to one and a half years should have been given to the latter.

Each candidate before he is admitted by the director is examined in the presence of the latter by the president of the school, assisted by the head teacher of the school of Husbandry.

The ordinary scholars of the Horticultural school pay no fees, and enjoy the same advantages in other respects as the scholars of the School of Husbandry, and, like the latter, give their labour for their board. Guests or casual scholars pay a moderate fee for their instruction, and have themselves to provide for their board and lodging.

Like the scholars of the School of Husbandry, those of the Horticultural School who leave before the completion of their course, are obliged to reimburse the school according to a fixed tariff for their instruction, board, &c., during their stay.

The regulations as to examinations, rewards, prizes, and certificate are similar to those of the School of Husbandry.

Special Courses of Lectures on Agricultural Subjects.

Besides the permanent educational institutions which form the great Establishment at Hohenheim, namely, the Academy, the School of Husbandry, the School of Horticulture, and the Experimental Station, a series of courses of lectures for special agricultural objects has also been organized. Several of these are regularly given at fixed periods, others from time to time, according as occasion may arise. Among the former may be mentioned an agricultural course for schoolmasters, courses on the cultivation of grass lands, thorough drainage, reclamation of waste land, fructiculture, and courses for shepherds, wheelwrights, and smiths.

Schools of Husbandry of Kirchbeg, Ellwangen, and Ochsenhausen.

In respect of the organization of these schools, and the character and extent of instruction given at them, these schools are similar to that of Hohenheim, and indeed to the analogous institutions founded in Bavaria and Baden. The only difference worth mentioning between these schools now under discussion and the Hohenheim one is the way in which the farm connected with the school is held. The case of the school of Kirchberg will explain the special contracts under which the head teachers rent the farms.

The State domain of Kirchberg, containing nearly 576 Wurtemberg acres, under tillage, pasture, gardens, roads, buildings, &c., was let on the 2nd February, 1866, for a term of eighteen years, subject to conditions as to surrender, &c., to be hereinafter named. The lessee is the president of the school of Husbandry, founded on the estate. The rights of the president are regulated by the fundamental rules laid down by the Government, and by such instructions as may afterwards be communicated.

The lessee is bound to follow a fixed course of management of the farm, and cannot make any essential change in it, such as the breaking-up of pasture land without the permission of the Central Agricultural Bureau. He is bound to keep from ninety to 100 head of cattle (of an average live weight of ten cwts. each), unless in cases of extraordinary scarcity of fodder. His breeding animals must be of one or two breeds, suitable for the district; sub-letting of any portion of the land or buildings is not allowed without the permission of the lessor. The latter holds from time to time visitations of the School of Husbandry, and of the farm and establishment generally in accordance with the fundamental rules. The lessee bears no part of the expense of such visitations.

The contract may terminate before the end of the term of eighteen years from either of the following causes:—1. The death of the lessee. 2. By taking up the farm from the lessee. 3. By the lessee surrendering the farm.

1. If the lessee dies before he enters on his contract, the latter shall be void. If he dies after entering on the farm, but before the expiration of the fourth year, his representatives shall have the right to hold possession until the completion of the sixth year, but if he dies after the expiration of the fourth year and before the end of the sixth year, the right of possession of the lessee's representatives extends to the end of the eighth year, provided in both cases that the latter claim the right. If the lessee dies after the expiration of eight years, the contract only lasts until the end of the current year.

In all the foregoing cases the authorities shall have the right to nominate a successor to the deceased lessee, as president of the school, who shall manage the farm, according to a plan sanctioned by the Central Bureau of Agriculture for the account of the heirs, during the remainder of the term for which the heirs can hold the farm. The latter being however consulted on the plan and having the right of inspecting the farm, &c. The substitute thus appointed is paid out of the salary of the deceased lessee as head of the school; the family of the latter provides him also with a sitting-room and bed-chamber. Should the heirs, however, wish to carry on the farm by their own steward and at their own expense, they can do so on the condition that the person selected by them shall be confirmed by the Central Bureau, and that the plan of management shall be adhered to.

The obligations of the president to the institution, and especially towards the scholars, are to be fulfilled by the heirs until the contract is set aside or ended. They receiving in return the subsidies for board, lighting, stationery, and books, washing, maintenance of implements, care of sick scholars, physician and medicine, &c., originally promised to the lessee. The allowance made in the rent as salary for acting as head of the school, ceases however after the forty-fifth day from the death of the lessee.

The lessee must surrender the farm without compensation:—*a*. If he is removed from his office of head of the school, in accordance with the organic rules of the institution, namely: 1. If he commits any offence for which civil servants, teachers, &c., are usually dismissed, especially such as lead to a temporary or permanent suspension of civil rights, or imprisonment for a longer period than one year.

2. In consequence of immorality or neglect of duty.

3. Of imprisonment for a considerable period unless the circumstances of the case are such as to enable the authorities to make an exception.

4. Disobedience to the authorities placed over him.

5. Proved incompetence as head of the school, as teacher, in consequence of physical or mental accidents.

6. When from illness he is kept from the fulfilment of a considerable portion of his duties, &c.

b. When the lessee, notwithstanding warnings served upon him, leaves the essential conditions of his contract unfilled or does exactly the opposite, as, for instance, by special neglect of the tillage of the land, or changes in the plan of operations which tend to impoverish the land, &c., the continuous sale of hay, straw, and dung, the wrecking of the buildings, the neglect of the necessary repairs or improvements of the building.

c. When the lessee owes, after deducting the amount of salary, a sum equal to three gales of rent, in which case claims which the lessee thinks himself entitled to make as a set off against the lessor are not taken into account.

The cases included under *b* are decided by the civil tribunal of the Kreis or Circle as an Arbitration Court and without power of appeal of either party. If this court does not undertake the arbitration, another court of arbitration is appointed, which will be described further on. In the case of *c* the Minister of Public Worship and Education can summarily cancel the contract without right of appeal.

The cancelling of the lease involves in every case the removal of the lessee from the office of head of the school, and the consequent loss of his salary as such. The contract and the working of the farm for the account of the lessee lasts to the end of the current year.

The lessee on his side has a clause of surrender at the end of every six years, on giving one year's notice.

Until the farm is taken off his hands he is bound to fulfil all the engagements entered into respecting the institution. The lessee must, however, give up his office of head of the school whenever he gives up the farm.

If at any time, owing to want of scholars or other cause, the authorities consider it desirable to give up the school, they can do so on serving the lessee with six months' notice to that effect. In such a case the lessee may carry on the farm to the end of the full term, and he receives half the salary of his office during two years after the school has been given up. Beyond this he has no further claim for compensation.

In cases of dispute between the lessor and lessee not included in those above mentioned, or in all cases when the civil tribunals decline to arbitrate, the differences are adjudicated by an Arbitration Court formed of four skilled persons, two chosen by each party, and a fifth by the four arbitrators themselves named by the litigants. The fifth member must be a lawyer and acts as president.

When the plaintiff has served notice on the defendant, and has named his arbitrators, the defendant must name his two within thirty days. If he does not do so before the expiration of that time, the plaintiff can apply to the superior Court to name the defendant's arbitrators. The decision of this Court of Arbitrators is final. Each party pays the expenses of his own arbitrators, the other costs are borne in common.

The jurisdiction of this Court extends not only to disputes about the conditions of the contract respecting the farm, but also to all those which may arise in respect to the contributions to be paid towards the expenses of the scholars, and the obligations of the lessee and president of the school in return therefor.

The School of Viticulture in Weinsberg.

A school of viticulture was opened in February, 1868, at Weinsberg. The object of this school is to train young men, chiefly of the class of vineyard gardeners or vine dressers, in the management of vineyards, fruit and vegetable plantations, nurseries of vines and fruit trees, so as to enable them to manage their own vineyards, &c., or to fit them to become well-instructed overseers, foremen, &c., of vineyards. To do, in fact, for this branch of agriculture what the schools of husbandry do for ordinary tillage farming. The organization of the school is also analogous to the Schools of Husbandry, allowance being of course made for the different character of the industry.

The course extends over two years, and as the school is calculated for twelve scholars there are six vacancies to be filled up annually. Candidates for admission must be over seventeen years old, strong, and in good health, and capable of undergoing the labour of the vineyard and gardens. They must be acquainted with the usual school subjects—reading, writing, and arithmetic, in which they are examined for entrance. The scholars receive in lieu of their labour lodging, board, and instruction, as in the Schools of Husbandry. At the end of each school year the scholars receive gratuities of money, the amount of which depends upon the work they have performed and the time they have been under instruction. Those who have distinguished themselves by industry, knowledge, and good conduct, receive also premiums of books. There is also a fund for assisting poor scholars with the means of purchasing clothes.

The instruction in the general principles of the cultivation of land is given by the president and vice-president; instruction in viticulture is given by a special vine-gardener, who has also general charge of the scholars. A gardener instructs in fructiculture and kitchen gardening. Instruction in the usual school subjects in geometry, drawing, and the elements of chemistry and physics, is given by the teachers of the local, primary, and *Real* school.

The land attached to the school, which was in part purchased for its express use by the Government, consists of 94 Wurtemberg acres, of which $3\frac{1}{2}$ acres are garden, $19\frac{1}{4}$ vineyard, $41\frac{5}{8}$ tillage land, and $29\frac{5}{8}$ pasture land. The vineyard is laid out so as to exhibit the different varieties of the vine, and a part as a model vineyard; there is a plantation for standard, improved, or ennobled fruit trees; a large orchard of the best kinds of table and cider, and perry apples, and pears; a kitchen-garden, a hop-garden, and small nursery. The object of the tillage and pasture land is to so connect ordinary agricultural operations with viticulture and fructiculture, that there may be always a proper supply of dung, and of horse and ox labour for the vineyards and gardens. This institution is provided with presses, fermenting vats, and a suitable cellar for showing the whole management and preparation of wine. For the purpose of bringing forward the finer kinds of vines there is a large glass house, which serves both as a vine house and for other plants requiring heat and protection. The garden is provided with forcing frames, and all other requirements of improved gardening. It is also proposed to cultivate tobacco and other industrial plants that are suitable for garden agriculture.

Schools for further Improvements, Evening Meetings, Reading Clubs, and Travelling Lecturers.

With the view of diffusing agricultural knowledge as widely as possible, the Government has encouraged the giving of voluntary instruction in agriculture in the Winter Evening Schools, which by the law on schools of 6th November, 1858, have been substituted for the Sunday Schools, attendance at which was rendered obligatory on youths from the age of 14 to 18, by the school law of 1836.

In addition to these, special voluntary agricultural Schools for further Improvement have also been set up, which are attended by young persons who have passed beyond the age at which attendance at evening schools is compulsory. In the latter category of schools the instruction, as in the obligatory Winter Evening Schools, is only given in the winter months, and on certain days of the week.

In the schools for the youths between 14 and 18 who come under the law of compulsory attendance at Sunday Schools, or the Evening Schools substituted for them, the subjects of instruction are such as are required in common life, inclusive of those taught in the ordinary schools, with special reference to agriculture. In the schools for those beyond the age of compulsory school attendance, the subjects of instruction are principally agricultural, and are treated with especial reference to the wants of the locality of the school. In both classes of schools for further improvement the instruction receives a thoroughly practical direction. The instruction in ordinary school business is given by primary and *Real* school teachers. The special agricultural instruction is given either by practical agriculturists or by persons who have received an agricultural training, especially schoolmasters. In order to meet the demand for the latter class, a special course of instruction is now given at Hohenheim for teachers. Courses will also be given in other Circles wherever there happen to be teachers capable of giving them.

The teachers, both of elementary school subjects and of agriculture, receive remuneration for their work independent of their salaries as primary or other school teachers.

The obligatory schools are under the Local School Committee, and inspected by the Local Inspector of Schools; the agricultural part of the instruction is looked after by a Delegate of the Agricultural Society, who draws the attention of the School Committee to any defects, and in cases of necessity may address complaints to the Central Bureau of Agriculture, which then calls upon the Local Committee to remedy any abuses, and if this be not done the Minister himself may intervene. The voluntary agricultural Schools for further Improvement are under the formal inspection of the Agricultural Association of the Circle. For this purpose the Agricultural Society appoints one or two delegates resident in the school district, who, with the co-operation of the clergy of the district and the mayor, or other principal magistrate, act as a school committee.

The Agricultural Society also holds an annual visitation of the voluntary schools of this class, to which the School Committee of the locality are invited. In the case of the obligatory schools the assistance of the Society is asked for the inspection of the special agricultural part of the instruction. The voluntary schools are under the general superintendence of the Central Agricultural Bureau, as well as the arrangements for agricultural instruction in the obligatory schools. The Bureau has also the power of granting aid to Communes to found Schools for further Improvement, according to the ministerial regulations on the subject, and within the limits of the grant made by the legislature for the purpose.

Evening meetings for the discussion of agricultural subjects have also been established in many villages, and are directly encouraged by the Government. In several Communes Agricultural Lending Libraries have also been set up, to which the Central Agricultural Bureau contributes by presents of books and agricultural reports.

And lastly, lectures are given on special agricultural subjects at meetings of the local branches of the Agricultural Society, and other gatherings of the rural population.

The following table shows the numbers of agricultural Schools for further Improvements of both Classes, the number of Communes in which Evening Agricultural Meetings are held, and the number of Reading Clubs, together with the number of persons participating in each case, for the years 1866-67, and 1867-68.

—	Voluntary Agricultural Schools for further Improvement.		Obligatory Evening Schools with Agricultural Instruction.		Agricultural Evening Meetings.		Reading Clubs.

3.—Agricultural Education in Bavaria.

Translation of Note of Herr von Daxenberger to Sir Henry Howard, Her Majesty's Minister at Munich.

Munich, May 6th, 1868.

The undersigned has the honour, with further reference to the esteemed note of Sir H. F. Howard, &c., of the 3rd of last month, and in order to complete the reply made to it on the 13th of that month, to make to him the following communication :—

The stipulations of the Royal Ordinance of the 21st of September, 1866, and of the Regulations sanctioned by it, as contained in the accompanying No. 22 of the Ministerial Bulletin for Ecclesiastical and Educational Affairs, of the year 1866, rule in Bavaria in respect to the training of schoolmasters.

The most detailed statistical information and returns respecting the Primary Schools in Bavaria, according to their state in 1862–63, are contained in the XIV. numbers of the Contributions to the Statistics of the Kingdom of Bavaria, published by Dr. F. B. W. von Hermann.

In respect to the Agricultural Schools, the undersigned has the honour further to annex a copy of the second edition of the work, *Die Landwirthschaft in Bayern* (Agriculture in Bavaria), which appeared in 1862, and which—commencing with page 241—treats of these schools, as well as three copies of the supplement to the December number of the Journal of the Agricultural Society [*Zeitschrift des Landwirthschaftlichen Vereins in Bayern*], which contains the most recent information relative to the state of these establishments, and some copies of the annual reports of agricultural schools, and at the same time to add the following explanatory observations :—

The so-called Agricultural Schools "for further improvement" [*Die Landwirthschaftlichen Fortbildungschulen*] form the lowest class of establishments for agricultural education.

In these schools the elementary instruction afforded at the Primary National Schools is extended, the power of thought is exercised, and the most important fundamental principles of agriculture are taught.

Next in rank to these are the Agricultural Winter Schools which exist in four places Ansbach, Kaiserslautern, Nördlingen, Würzburg), and in which the fundamental principles of physical science are chiefly treated of.

Besides the Winter Schools there exist in two places (Thüngen, near Würzburg, and Friesdorf, near Anspach), Shepherds' Schools with a period of instruction of 2–4 weeks, in which shepherds who have learnt their business, take part, in order to develope their knowledge in the technical and scientific branches of sheeptending.

Moreover there are held in Würzburg, Triesdorf, and Munich annually, in Augsburg, Ratisbon, and Bayreuth, accordingly as may be wanted, courses of instruction for technical cultivation, the cultivation of meadows, and drainage. The courses of instruction afforded at Munich are attended by the scholars of the Architectural School, who are preparing themselves to be masons and carpenters ; the other similar courses of instruction are attended by young men who are desirous of employment as elementary cultivators and assistants for the laying down of meadows. There are special courses of instruction at Munich and Würzburg for shoeing.

There is a special course of instruction established at Weihenstephan for the scientific principles of brewing. Moreover it is intended to establish special courses of instruction for the distillery of brandy, and for the making of cheese, which are likewise only to be attended by the persons who have already acquired experience in those branches of business.

Young men belonging to the class of peasants receive a more extensive instruction in the agricultural schools which exist in the provinces of Upper Bavaria, Lower Bavaria, Upper Palatinate, Upper Franconia, Lower Franconia, and Swabia.

The instruction is calculated for two years, and has for its object to qualify the scholars to manage in the best manner that may be possible, the estates belonging to peasants. Whilst in the agricultural schools the practical education of the scholars is principally kept in view, the "Agricultural Middle Schools," which are sections of the Trade Schools, occupy themselves more particularly with the scientific branches of agriculture. Only one of these schools (Lichtenhof) is connected with the management, on a comprehensive scale, of a farm ; whereas at the "Agricultural Middle Schools" practical management on an extensive scale is not taken into consideration.

The Agricultural Central School—Weihenstephan, the object of which is completely to illustrate the scientific portion of agriculture, forms the keystone of the edifice of agricultural instruction.

With respect to the details of the course of instruction, and to the attendance of the schools, reference is hereby made to the printed papers enclosed in this note.

The undersigned avails, &c.,

(Signed), in the absence of the Minister for Foreign Affairs,

The Privy Councillor.

V. Daxenberger.

Sir H. Howard.

The following is a summary of the information contained in the documents enclosed to Lord Stanley for the use of the Royal Commission, and referred to in the foregoing letter of Herr von Daxenberger :—

In the year 1822 an institution for agricultural education was established on a domain of the State at Schleissheim. The scholars were divided into three classes ; those who were destined to be workmen and subordinate officers on farms or in establishments for the branches of industry connected with agriculture ; those who were to undertake the management of farms or establishments for agricultural industries ; and lastly, those, whether proprietors or others, who intended to study scientific agriculture. In 1839 this institution was reorganised under the name of the Agricultural Central school ; it was only in 1849, however, that the separation of the institution into a school for the higher scientific instruction in agriculture and into a School of Husbandry (*Ackerbauschule*) took place. In 1833 a class of trade schools was established, at which instruction was also

given; and in some separate teachers were appointed for that purpose. In the same year the first President of the newly established Society for Industry and Agriculture, Dr. J. Jacob Weidenkeller, founded an Agricultural school for orphans, which was opened in January, 1834, for the reception of twelve orphans at the Castle of Hummelstein. Under the fostering care of the brothers Weidenkeller and the assistance of the society above-named, and of the Fohlenhof Joint-Stock Company of Nürnberg, it gradually grew into the important middle school of Lichtenhof. In 1840, Dr. Weidenkeller founded an agricultural journal, the *Lichtenhofer Blätter*, which still exists, the profits of which were devoted to the endowment of five places for poor boys. In 1842 the brothers Weidenkeller also endowed the school with a small farm, and the necessary stock, &c. In 1850 the number of scholars had increased to an average of 100. In 1847 the School of Husbandry (*Ackerbauschule*) of Triesdorf was established.

The success of these several institutions and the movements going on all over Europe in favour of schools for technical instruction of all kinds led to the systematic organization and extension of agricultural instruction. In 1852 the Agricultural Central school was transferred from Schleissheim to Weihenstephan near Freising and again re-organized. Several Farming schools, like that of Triesdorf, were set up for the purpose of instructing the peasants' sons, while to meet the wants of the middle classes, an intermediate class of schools or agricultural middle schools were also established generally in connexion with trade schools.

In order to put agricultural education on as thorough a basis as other branches of technical education the agricultural schools were re-organised, and the system of instruction improved and extended in 1865–66, so that at present the system of technical instruction in Bavaria is as complete as regards rural as civil industries. Thus to each class of technological schools there corresponds a similar agricultural one, as the following table shows:—

Civil Industry, or Technology, properly so-called.	Rural Industry, or Agriculture.
I. Technological schools for further improvement, or *Gewerbliche Fortbildungs Schulen* (*Handwerks Feiertags Schulen.*)	I. Agricultural schools for further improvement, or *Landwirthschaftliche Fortbildungs Schulen* (*Sontags Schulen*).
II. Technological and Trade schools, or *Gewerbs-und Handels Schulen.*	II. Agricultural Middle schools and Schools of Husbandry or *Landwirthschaftliche Mittel Schulen* and *Ackerbauschulen.*
III. Polytechnic school, or *Polytechnische Schule.*	III. Agricultural Central school, or *Landwirthschaftliche Centralschule.*

Universities.

Besides the Agricultural Central School there are two other collegiate establishments which may be classed as agricultural institutions, the Central Forestry school at Aschaffenburg and the Central Veterinary School in Munich. The former, besides the Director, has four professors and one Docent, or private tutor. The course extends over three years, and is attended by above 100 students. There are seven professors at the Veterinary School; the course there also extending over three years. In 1862–63, the latest year for which we have information, there were fifty-two students and fourteen extern or occasional students, and 219 farriers or smiths receiving instruction.

I.—Agricultural Schools for further Improvement.

These schools were first established in 1866, at the suggestion of the Agricultural Society. The idea was so warmly taken up that 104 such schools were established in the course of the year, and preparations were made for the opening of several others. No doubt many of these were experiments and may not be continued, but so far the scheme has been successful. The object of these schools is the improvement of the farming of the peasants, and especially the more rapid development of the modern methods of cultivation, the introduction of improved implements and breeds of farm animals. They are mainly based upon the same fundamental idea as the Technological schools for further Improvement, and are intended to provide those who cannot attend the Schools of Husbandry or Middle Schools with the means of improving and enlarging their elementary instruction, of using and sharpening their thinking powers, and of learning the most important principles of agriculture. The instruction given at these schools is directly connected with that of the weekday or common primary schools.

Attendance at these schools is optional, but those who attend them are dispensed from attendance at the ordinary instruction of the Sunday schools which is obligatory upon all who have not attained a certain standard. They are not, however, dispensed thereby from religious instruction.

The teaching in these schools as already mentioned consists in the deeper grounding and practical enlargement of the subjects taught in the primary week-day schools. In teaching reading a suitable agricultural reading book is used and explained. So in teaching writing and arithmetic attention is especially given to examples of agricultural work, sales and purchases, and to the introduction of a simple system of book-keeping. These schools where means do not exist for paying a separate teacher are held in the evening.

Two schools which form as it were links between the Sunday schools for further Improvement, and the Schools of Husbandry or *Ackerbau* schools, or rather which have been set up in lieu of them in the Circles of Lower Franconia and the Palatinate, deserve to be mentioned. The first is the School for the further Improvement of Peasants' Sons at Würzburg (*Fortbildungs Schule für Bauernsöhne*) which existed previously under the name of a School for Meadow and Pasture cultivation (*Wiesenbau Schule*). In 1866 its scope was extended and its name changed. It was instituted and received its present form from the Government Assessor, Herr Lorenz Braunwart, who acted as its director. It receives annually from the resources of the Circle 2,500 florins, from district contributions 3,625 florins, from fees for board, &c., of scholars 2,450 florins, from two Communes each 50 florins or together 100 florins. It also possesses an invested stock of 1,403 florins and 58 kreuzers which the Lower Franconian Agricultural Society gave on the occasion of the twenty-fifth year jubilee of His Excellency the Governmental President State and Imperial Councillor, Freiherr von Zu-Rhein, and which that gentleman, who is himself one of the most active promoters of this institution, increased by a gift of 1,000 florins, the interest of which the school enjoys.

Besides the theoretical instruction given in winter, this school affords the scholars practical instruction in a novel manner, by undertaking in the summer season agricultural work, such as drainage by open ditches, tile or other forms of covered drains, regulating streams, embankments, road making, yard and stall paving, laying-out of artificial meadows, irrigation works, laying down nurseries of fruit trees, forming promenades,

reclamation of waste land, &c. These works are mainly executed by the scholars, who receive wages for the work done.

In 1861–62 the number of scholars was 129; in 1862–63, 124; in 1863–64, 101; in 1864–65, 97; in 1865–66, 69, which the present rector thinks about the normal number which the district will in future supply. The higher numbers of the first year being due apparently to the attendance of persons beyond the usual school age. In 1866–7 the number fell in consequence of the war—the district being the scene of military operations—to 33. Perhaps the departure of its first director, Herr Braunwart, who was promoted to be a Government councillor at Ansbach, may have also contributed to its decline. The Report of 1866–67 contains a list of 179 agricultural works, such as those above mentioned, varying in cost from a few shillings to more than £150, executed during the year either by the actual scholars or those who had been at the school.

The second school referred to above is the *Gewerbe* or Technological School of Kaiserslautern, to which an agricultural winter course has been added. The general direction of this course is intrusted to the rector of the Technological school; the salaries of the teachers are paid for by the land council of the Palatinate, the schoolhouse and the educational appliances are provided by the town of Kaiserslautern. The agricultural winter-class are taught the general school business by the teachers of the *Gewerbe* School, but at different hours from the scholars of the latter. The schools are only so far connected that the same teaching staff and the same buildings, &c., are utilized for both.

The number of teachers, exclusive of the director, is four. The subjects of instruction are: the German language, which is taught six times a week; history, twice a week; geography, twice a week; arithmetic, four times a week; natural philosophy—physics, and chemistry, four times a week; natural history—mineralogy, botany, and zoology, four times a week; agriculture—implements, soils, tillage, climatology, manures, general plant-culture, special plant-culture, four times a week; drawing, twice a week. Each lecture lasts one hour.

From the middle of January, on Mondays and Fridays, the scholars are employed from one to four o'clock either alternately in the joiner's workshop of the Technological School, in the making of simple implements, &c. (ladders, racks, &c.); surveying and levelling; pruning and grafting; arranging for the conveyance of water by means of a set of asphalt tubes; or in the laboratory, where they are made to prepare urea, hippuric acid, uric acid, starch, gluten; and shown how to determine the dry matter of plants, to estimate the amount of gravel, sand and clay in soils, their power of retention for water, their absorptive power for salts, &c., the use of the microscope. They are also taught the use of improved implements and machines. Practical instruction is also given by excursions to neighbouring farms, forests, vineyards, mills, &c.

This school opened in November, 1865, with 13 scholars. A winter course of instruction was also opened in 1866–67 in Ansbach, and another in 1867–78 in Nördlingen. An attempt was also made in 1866–67 to set up one in Freising, but with little success.

In connexion with the Technological or *Gewerbe* School of Kaiserslautern it may be mentioned that in the Weaving School in Passau instruction is given in the cultivation and preparation of fibrous plants suitable for the purposes of making textile fabrics.

Schools of Husbandry (*Ackerbau Schools.*)

The function of this class of schools is to impart to young country lads, especially the sons of peasants or small farmers, a higher practical skill in agriculture, particularly in the use of improved implements and agricultural machines, as well as in the industries immediately connected with agriculture, so as to fit them to manage small farms, to act as foremen, shepherds, implement makers, &c. One-third of the scholar's time is devoted to theoretical subjects, and two-thirds to practical working on the land, in the farm-offices, or workshops.

The instruction is generally divided into two courses of one year each. The subjects of instruction are the following: religion, repetition of the subject matter of elementary education, and raising the standard of knowledge in those portions which are of special use to an agriculturist; theoretical agriculture embracing climate, the atmosphere properties and treatment of soils, manures, nutrition of plants, structure of seed, sowing, culture of plants, and harvesting of crops; agricultural machines and implements—their construction, repair, taking asunder, refitting, and use. The study of the different systems of husbandry, rotation of crops, cultivation of meadows and pasture lands, drainage. Qualities, selection, breeding, rearing, feeding, and employment of farm animals, precautions to be taken with sick animals.

Forestry.—Growth of timber, care of woods, use of woods, protection of woods, &c., culture of culinary vegetables and fruit; rearing and improving fruit trees; position and condition of soil suitable for fruit trees; planting, rearing, and preservation of culinary vegetables.

The practical instruction consists of work in the nursery and experimental field, as well as participation in all operations in the tillage and pasture land, woods, garden, turf-bog, barns, cattle stalls, the dairy, the cheese-house, and distillery.

During the winter and on rainy days instruction and exercises are given in the making and repairing of agricultural implements, &c.

All these various works are carried on under the superintendence and instruction of the farm-steward (*Feldbaumeister*). Excursions are also made to neighbouring farms having different kinds of soil and methods of cultivation. The horticultural scholars have an extensive practical field in the kitchen or market garden.

This class of schools are district or Circle institutions and have been established at Schleissheim, in Upper Bavaria, at Lurzenhof, near Landshut, in Lower Bavaria, at Ramhof in Suabia, at Triesdorf and Lichtenhof, in Middle Franconia; at Bayreuth, in Upper Franconia; and at Pfrentsch, in the Upper Palatinate. Candidate scholars are required to be over fifteen years of age, to possess adequate knowledge of reading, writing, and arithmetic; to be of a healthy and strong constitution, and of good character.

School of Husbandry of Schleissheim.

This school was established on one of the royal domains in 1852, on the transfer of the central school to Weihenstephan. The course of study extends over three years. Several of the officials of the estate act as teachers, and the manager of the domain is president. The latter teaches the special cultivation of plants and the management of estates. The other teachers are:—the curate or chaplain who lectures on religion; the agricultural teacher, to whom is specially intrusted the agricultural training of the scholars; the teacher of the cultivation of meadows and pasture land and drainage; the veterinary surgeon of the domain, who teaches the breeding, rearing, and management of farm animals, and the elements of veterinary medicine; the teacher of kitchen-gardening and of fructiculture, and of natural sciences; the district forester, who teaches the management of forests; the schoolmaster of the locality, who teaches the usual elementary school subjects;

the farm-steward (*Feldbaumeister*), who teaches agricultural operations on a large scale; the overseer of the turf bogs of the estate, who gives instruction in the proper method of turf cutting, drying, &c.; the cheese-master of the domain, who teaches dairy husbandry. There is also a house-steward, who superintends the scholars both within and without the establishment.

In 1866–67 the number of scholars was, of interns—first year, 12; second year, 8; third year, 1; total, 21; of auditors or externs, 4; or altogether 25.

Theoretical instruction is chiefly given in the winter months, and in summer only on rainy days and at times when no open air work could be undertaken by the scholars.

In order to give an idea of the extent and character of the course of instruction at this class of schools we shall give a synopsis of the principal heads of the subjects taught at that of Schleissheim.

Religion.

Introduction to the Commandments—The first seven Commandments.

Elementary Subjects.

a. Orthography, composition, writing business letters and other similar documents; short essays on agricultural subjects. *b.* Arithmetic: vulgar and decimal fractions, proportion, chain rule, practical application of calculations to sheep-farming, horse-keeping, milling, and meal and flour, baking of bread, price of bread and flour, management of woods, more complex examples from everyday life; special exercises in mental arithmetic, with different measures and weights, home and foreign coinage, reduction of money. *c.* Introduction to book-keeping by single and double entry, closing of accounts and balancing of books.

Natural Sciences.

This subject was only introduced for the first time in the summer of 1867, and was limited, in *physics*, to the general properties of bodies, equilibrium and motion of solid and fluid bodies; heat and its action. In *chemistry*, the function of this science as regards agriculture and the most important laws of the combination of bodies were taught and illustrated by experiment. The more important simple bodies of interest to the farmer were also prepared and exhibited. Owing to want of time, as during the summer months practical operations occupy the first place, as well as the want of a suitable laboratory, this branch of instruction could not as yet be treated in a manner adapted to the present stand-point of agriculture, and as would be desirable for the scholars.

Agriculture.

Climate, the atmosphere, knowledge and estimation of the value of different kinds of soil, their reclamation and cultivation; implements and machines, their manufacture and repair, taking of them asunder, and putting of them together, their use, manipulation, but especially on the manipulation and use of sowing, thrashing, and hoeing machines, in order to learn to avoid the many mishaps which occur with them; the laying out of manure pits, manure making, the use of different kinds of manure; the knowledge of seeds, and the different methods of sowing and planting, putting in the seed, the management of the young plants during their growth; the conversion of fallow cultivation into regular rotation of crops, calculation of the amount of manure required; the different methods of harvesting, thrashing, winnowing, storing, and drying of crops; the valuation of crops; the establishment and carrying out of simple farm accounts; drawing plans and models to scale, &c.

Technical Industries.

The dairy and dairy produce. The erection and management of distilleries, and the materials suitable for the production of spirit.

Meadow and Pasture Cultivation.

a. Preliminary knowledge—1. Levelling; 2. Surveying; 3. Laying out of drains and dams in water meadows, and the necessary measurements and calculations connected therewith; the quantity of water required for irrigation; 4. Implements used in the cultivation of grass lands. *b.* The practical carrying out of irrigation. *c.* Meadows and pastures, meadow and pasture plants, amount of seed required, and time of sowing, gathering the seed of grasses, &c.; irrigation of meadows, top dressing grass-lands with farm-yard dung, composts, liquid and artificial manures; the hay harvest and its produce; brown hay; nursing of meadows; improvement of meadows by other methods than irrigation.

Drainage.

When and how to supply it; preliminary work; the execution of drainage operations.

Breeding, &c., of Animals and Veterinary Medicine.

In treating of the breeding, &c., of animals, the most important points in general anatomy are first taught, and then the special breeding, &c., of each farm animal is taken up in succession, beginning with the horse, then cattle, sheep, and lastly pigs. The special study of each kind of animal commences with the portions of natural history most worthy of being known; the races are then examined, especially those of Bavaria, and their most characteristic qualities pointed out. After an account of the different methods of improving the breed of cattle, especially by the introduction of foreign male and female animals of the best races, by crossing, and by breeding in and in—the advantages and disadvantages of each method being pointed out—then follows the special subject of breeding, rearing, &c., of animals—*e.g.*, 1. Determination of the qualities of the animals best suited for each special use, such as butcher's meat, milch animals, draught animals, &c. 2. Selection of animals for pairing according to age and use, and in the case of horses, information as to the defects to be avoided. 3. Treatment of pregnant animals (signs of pregnancy, food, watching and attention during it). 4. Birth (regular symptoms of it, assistance allowed in difficult and abnormal parturition), treatment of the mother immediately after the birth. 5. Treatment of the calf (methods of rearing), quantity and quality of milk given to the calf, weaning. 6. Feeding, watching, and management of the adult animal (milch, fattening, and draught animals; quantity and quality of the fodder stuffs, folding of sheep, growth of wool, &c., washing of sheep); determination of the live and dead weight of animals. 8. Use of animals for draught (work done, harness, &c.) 9. Precautions to be observed in the purchase of animals, especially of horses, legal defects of warranty, duration of warranty, limit of time within which a plaint must be lodged. 10. The most usually occurring accidents, and the remedies to be adopted in cases of necessity, and in the milder diseases, especially with regard to their treatment by professional veterinary surgeons.

As regards veterinary practice and operations, the scholars attend whenever there is an opportunity, so as to see as much as possible of the practice. Bleeding from different parts in different animals, help in case of wind

in ruminant animals by the trochar, &c., assistance during parturition, treatment of slight wounds, opening of abscesses, shoeing of horses and oxen. The scholars are also in turn employed in the infirmary, in order to learn practically the care of sick animals.

Forestry.

On wood culture, especially on the natural sowing of leafy and coniferous trees; artificial wood culture—by sowing, planting and cuttings, mountain-forest management, plain-forest management, wood nursing and wood protection, injurious actions on woods, precautions against them; on the employment of woods, the circumstances that appertain thereto, and how a wood and its products may be best used in an economic sense. The winning and use of seeds, especially on the time of their ripening, duration of germinating power, gathering, preparation and preservation of seed; quantity of seed and methods of sowing of the different trees; the seedlings and their further treatment; the young plants of the different trees. On the uses of forests, and especially what may be reckoned to belong thereto, how far they may be used for hay and pasture, and under what circumstances these uses would be injurious. Calculation of the cubic contents of trees—standing, lying, felled and unfelled timber; calculation of surface, determination of the quantity of seed to be sown, or of young trees to be planted in a cleared space or waste. Finally, the cultivation of wood outside of forests, and practical instruction and illustrations by excursions in the neighbouring forestry districts or reviers.

Kitchen and Orchard Gardening.

The nutrition of plants and the condition of growth were taken as the basis of all practical operations. The cultivation of vegetables were treated with especial reference to market gardening, and the cultivation of seed. Fruit cultivation so important for farmers, was taught in all its parts—sowing, grafting, rearing in the nursery, planting out, management, diseases. Pruning, &c., of trees, as dwarfs, standards, and espaliers, were taught according to the fundamental principles upon which these operations depend. Finally, the gathering, preservation and use for drying and boiling were taught, and illustrated as far as circumstances permitted.

In the garden there was an assortment of the best fruits, and also of the hardy varieties which thrive on exposed places. By means of names affixed to them, they were kept constantly before the eyes of the scholars. The better kinds of culinary vegetables, as well as other useful or otherwise important plants, were cultivated for the instruction of the scholars, and their attention was directed to their uses.

The agricultural and horticultural scholars were instructed partly in common, and in part separately.

Besides, the foregoing works of various kinds, the scholars were employed in the nursery, the experimental ground, in extensive and continuous exercises in the field, granaries, meadows, woods, garden, turf bog, in the byres and stables, dairy, cheese-house, distillery, and in winter and rainy weather they were employed for instruction at the carpenter's bench, the vice and lathe in wood and metal turning, and at the carving bench, at the making and repairing of agricultural implements, models, &c. While engaged in these various operations, the scholars are always under the immediate direction and instruction of their respective teachers.

The horticultural scholars receive constant instruction in the kitchen and fruit gardens, under the guidance and supervision of the horticultural teacher.

Excursions to farms, forests, factories, &c., form an important means of instruction.

Experiments with new implements and machines, cultivation of peaty land, trials with manures, and experiments on the cultivation of plants, in all of which the school was aided and encouraged by the general and Circle committees of the agricultural society.

Educational appliances.—The school possesses collections of models, rocks, minerals, and soils, models of fruit, a complete skeleton of a horse, and parts of those of other domestic animals, a herbarium, tools for the repair of the smaller agricultural implements, and the construction of models.

Examinations are held at the end of each session, which are attended by the authorities of the district proprietors, farmers, &c.

School of Husbandry of Lurzenhof.

This school which is now at the farm of Lurzenhof, near Schönbrunn, not far from Landshut, was established in 1854. The farm consists of 104 *Tagwerks*, 43 *Dezines* of land under tillage, pasture, wood, garden, and farm steading. It has five teachers, and in 1866–67 ten scholars, of whom two were in the first class, seven in the second, and one in the third.

The Circle School of Pfrentsch for the Cultivation of Meadow and Pasture and Tillage Land—(*Die Kreis-Wiesen und Ackerbauschule*) was first opened in October, 1855, as a school for the culture of meadows and pasture land (*Wiesenbauschule*)—The drained Pfrentsch-Weiher basin, offering an excellent opportunity for instruction in this department of agriculture, which for this district is of vital importance. In 1859–60 it received its present extension. It is situated on a farm belonging to the circle of the Upper Palatinate, containing 108 *Tagwerks*, and a piece of land, rented from the State, containing a little over 98 Tagwerks. The school rents 1,200 Tagwerks of the Pfrentsch-Weiher basin, which is being laid out as artificial meadows. The course of instruction extends over two years. In 1866–67 it had eleven scholars, seven in the first class and four in the second. Paying scholars pay 140 florins, and if they belong to another Circle or are foreigners they pay in addition 25 florins annually, as a fee for teaching. The free scholars, if industrious and well-conducted, receive beside their board and free instruction, a stipend of 30 florins, which the Government may hold over until the end of the course, when it is paid either in money or in a useful instrument, implement, or other object of equivalent value. In 1860–61, besides a stipend of 165 florins, the school received 1,740 florins from the funds of the Circle, to which the sum of 1,500 florins was added from the central or state educational funds.

The Circle School of Husbandry of Upper Franconia,

Was established in the outer Spitalhof at Bayreuth for 1865–66. The course extends over three years. The number of teachers is seven. In 1866–67 the number of scholars was sixteen, of whom nine were in the first class, five in the second, and two in the third. The farm consisting of 140 Tagwerks, and four fish-ponds, belongs to the hospital.

The Circle School of Husbandry of Triesdorf in Middle Franconia.

This school was founded in 1847 as a central institute upon the royal domain of that place, and put under the manager of the estate. In 1852 the whole organization was modified and improved. The whole domain, with the exception of the State forests was let with the consent of the King to the school, to be farmed by it

independently. In 1854 the school became a circle institution. The domain consists of a compact piece of land, containing 578 *Tagwerks*, under tillage, grass, gardens, &c. The tillage land is divided into eight divisions of about thirty to forty Bavarian *Tagwerks*, each which were cultivated according to the system of rotation of crops. Attached to the school farm is the Circle cattle-breeding establishment, which in 1866–67 had seventy-six head, among which were twelve draught oxen. The other animals were seven horses, 150 Franconian sheep, twenty Negretti breeding ewes, and six to eight pigs, to use up the offal of the establishment.

The technological industries attached to the school and farm are a dairy, cheese-house, and distillery.

The fruit tree nursery contains nearly thirty *Tagwerks*, and had yielded in 1866–67 2,628 young trees.

The school possesses a collection of improved agricultural implements, models, diagrams, a natural history collection, a cabinet of seeds and ears of corn, and grasses, a collection of the soils of Middle Franconia, a small library, beehives, and an experimental field.

The following synopsis show the subjects taught during each year of the course :—

First year.—I. Agriculture ; 1, general plant culture—soils ; 2, special plant culture ; 3, pasture and meadow cultivation. II. Fructiculture. III. Veterinary medicine, &c. IV. German language—composition, writing of business letters, &c. V. Arithmetic and geometry. VI. Drawing. VII. Physics and chemistry.

Second year.—I. Agriculture—1, breeding, &c., of animals ; 2, farm management ; 3, book-keeping ; 4, agricultural technology. II. Veterinary instruction—1, exterior of the horse, horse-shoeing, veterinary practice in cases of necessity. III. Fructiculture (including uses of fruit, viticulture, kitchen-gardening). IV. German language—composition. V. Arithmetic and geometry. VI. Drawing in the winter. VII. Physics and chemistry.

The Circle School of Husbandry of Ramhof near Donauwerth in Swabia and Neuburg.

In 1855 a farming school was established upon the estate of Freiherr von Gaisberg, the farm being leased for the purpose for twelve years. The local or Circle funds of this school amounted to 3,555 florins, and the State also contributed. In 1861 or 1862 this school was given up, and has been replaced by one on the farm of Ramhof, for which a capital of 48,000 florins had already been set apart from the funds of the Circle before the former one was given up. In 1866–67 the number of scholars was twelve. The course of instruction is three years. The number of teachers is not given.

III. The Agricultural Middle Schools.

(*Die Landwirthschaftlichen Mittelschulen.*)

These schools, which are generally attended by the sons of large farmers, brewers, land-holding burghers, &c., are attached to several of the technological or trade schools, but as independent departments. They are intended to give instruction to those occupied with mixed agricultural and manufacturing industry in the provincial towns and low lands, and to serve as preparatory institutions for the central agricultural school, and for higher agricultural instruction generally.

The subjects of instruction are :—religion, arithmetic, the German language, history and geography, natural history and geography, agriculture, agricultural chemistry, geometry, mechanics in connexion with agriculture, and agricultural exercises in the experimental field.

Such institutions exist at present at Freising, in Upper Bavaria ; at Straubing, in Lower Bavaria ; at Kaiserslautern, in the Palatinate ; and at Lichtenhof, in Middle Franconia. The regulations for entrance are the same as for the other scholars of the Technological or Trade Schools.

The Agricultural Middle School of Freising.—In 1866–67 this school had twenty-five scholars, of whom eleven were in the first class, ten in the second, and four in the third class. The institution possesses a chemical laboratory, organized also for agricultural chemistry, a collection of models, an experimental field of 7·21 Tagwerks. The neighbourhood of the agricultural central school of Weihenstephan affords great facilities for seeing operations, &c., on a large scale. In the winter of 1866–67 an agricultural winter course was also given in connexion with the institution.

The Agricultural Middle School of Straubing.—The course of instruction at this school extends over three years, but as it was opened in 1865–66 it could have had no third year's scholars in 1866–67. In that year there were six first year scholars, three second year scholars, or a total of nine.

The Agricultural Middle School of Kaiserslautern.—This school had five scholars in 1866–67, of whom three were first year scholars, and two second year. The third year class came first into operation in 1867–68. The school possesses excellent teaching appliances, and is well situated for making excursions. A winter course or school for further improvement has been combined with this institution, which promises to be successful as it had no less than ten scholars in the first year.

The Agricultural Middle School of Lichtenhof near Nürnberg.—This institution consists of three schools :—1, a School of Husbandry or *Ackerbauschule*, chiefly intended for peasants' sons who intend to work small farms, to be foremen, working stewards, &c. ; 2, a preparatory school (*Vorbereitungsschule*) for those who are not sufficiently advanced to join the Middle School, but who might be able to do so after a preparatory course ; and third, the agricultural Middle School for young persons, sons of proprietors, middle and large farmers, who purpose completing their education at the school or proceeding to the higher central agricultural forestry or veterinary schools.

The course of instruction in the School of Husbandry (*Ackerbauschule*) embraces religious instruction, both Catholic and Protestant, given to the scholars of each communion by their respective clergymen (2 hours a week) ; 2, theoretical agriculture (6 hours a week) ; 3, practical agriculture, from 8 o'clock A.M. to 12 o'clock daily ; 4, chemistry (2 hours a week) ; 5, German language (4 hours a week) ; 6, arithmetic (4 hours a week) ; 7, geography (2 hours a week) ; 8, drawing (3 hours a week ; 9, writing and composition (4 hours a week). The course extends over two years. In 1866–67 three scholars attended the first year's course, and three the second ; or together six. Among them were some adults, one over twenty-seven years of age, and another over twenty-two years of age.

The course of instruction in the Preparatory School was :—1, religion (2 hours a week) ; 2, theoretical agriculture (2 hours) ; 3, practical agriculture ; 4, arithmetic (4 hours) ; 5, reading (1 hour) ; 6, writing (4 hours) ; 7, German language (4 hours) ; 8, geography (2 hours) ; 9, elementary science (8 hours) ; 10, drawing (8 hours). Three scholars attended this course in 1866–67.

The course of instruction in the Middle School extends over three years, and embraces :—

I. First year's course—1, religion (2 hours) ; 2, theoretical agriculture (5 hours)—soils, clearing, and reclaiming land, tillage operations ; 3, practical agriculture (according to the season and the work to be done from 12 to 30 hours weekly) ; 4, natural history (5 hours) ; zoology (2 hours) ; general botany (2 hours) ; special botany

(1 hour); 5, arithmetic (4 hours); German language (4 hours); 6, German language (4 hours); 7, geography (2 hours); 8, drawing (6 hours); 9, writing (4 hours).

II. Second year's course—1, religion (2 hours); 2, theoretical agriculture—manures, general plant culture, special plant culture, continuation of special botany (7 hours). Practical agriculture as in the first year; 4, natural science (5 hours); physics (3 hours); chemistry (2 hours); 5, arithmetic (4 hours); 6, geometry (2 hours); 7, German language (4 hours); 8, drawing (4 hours).

III. Third year's course—1, religion (2 hours); 2, theoretical agriculture—general and special production of animals (4 hours); agricultural operations (5 hours); 3, practical agriculture as in the first and second years; 4, chemistry—pure chemistry, agricultural chemistry, chemical principles of agricultural technology, making of wine, beer, spirits, vinegar, starch, bread, sugar, fats and oils, cheese; elements of chemical analysis (4 hours a week); 5, mineralogy (1 hour); 6, anatomy and veterinary medicine (2 hours); 7, geometry (3 hours); 8, German language (3 hours); 9, drawing (4 hours).

The number of students in attendance in 1866-67, was 63, exclusive of 5 who left during the session, and of two who could not attend owing to illness. Of these, 25 were first year's scholars, 20 second year's, and 18 third year's.

The State granted some free places to poor scholars, and abated the fees for others. Stipends for industrious scholars were also given by the General Committee of the Agricultural Society, and by the Agricultural Circle Committees of Ansbach and Augsburg.

IV. The Agricultural Central School at Weihenstephan near Freising.

This institution was transferred, as has already been stated, in the year 1852, from Schleissheim to Weihenstephan, and re-organized. Its object is to educate the students in the theory and practice of agriculture, and the branches of manufacturing industry, combined with or immediately dependent upon the latter, so as to fit them to set up, direct and obtain the best results from the cultivation of large farms, or factories of sugar, beer, vinegar, cheese, and other more or less rural products. The institution may be said to embrace four distinct schools:—1, a preparatory school for such candidates as are found unprepared to attend the regular schools; 2, a fructicultural school intended for the education of gardeners, &c., which has been established for the purpose of utilizing the educational advantages of the fine gardens of the establishment, and of more economically keeping them up; 3, the high school proper; and 4, the technological or industrial school.

The students consist of—the students proper or *Eleves*—who attend all the courses, of the auditors or *Hospitants*, who attend at least three courses, and the technologists or those whose objects are chiefly to acquire a theoretical and practical knowledge of industries directly connected with agriculture. To become an *Eleve* the candidate must have completed his 16th year, and present certificates of having passed through the full course of a complete agricultural and technological school, or attended the two first courses of a *Real*-school, otherwise they must undergo an entrance examination which shall embrace the subjects taught in the institutions just named, and the necessary preliminary knowledge of the Latin language. A certificate of previous good conduct must also be presented.

The scientific instruction in this institution embraces the following subjects divided according to sessions.

In the First Course.

Winter Session.—Physical geography, agricultural chemistry, general morphology of plants, anatomy and physiology of the animal organism, agricultural implements, drawing, applied mathematics, general architecture.

Summer Session.—Œconomical and forestry botany, special structure of plants; description of farm management, special breeding, rearing and management of animals; land surveying; agricultural chemistry.

In the Second Course.

Winter Session.—Special breeding, rearing, and management of animals, veterinary medicine; cultivation of tillage and meadow land, farm arrangement and management; agricultural technology; agricultural architecture; forestry; agricultural law.

Summer Session.—Continuation of breeding, rearing, and management of animals and of veterinary medicine; cultivation of meadows; agricultural technology (continuation, fructiculture, viticulture, and horticulture); agricultural valuation of estates, and book-keeping; continuation of forestry and agricultural law.

Practical instruction is given in all, theoretical and industrial branches admitting of it by means of practical exercises and occasional excursions, and at least one-half of the whole period of instruction is devoted to it, the period of the year and the weather being taken into account. Due care is taken for the religious services and religious lectures of Catholics and Protestants.

The students (*Eleves*) reside in the Institution. Bavarians pay for instruction, lodging, including bed, fire, light and service, breakfast, dinner, and supper, 125 florins. Foreigners 150 florins, and 2 florins for the use of the reading-room.

Such youths as have completed their sixteenth year may be admitted as externs or auditors (*Hospitants*) for not less than three subjects of instruction when they possess the indispensable previous preparation for such studies, engage to attend the lectures regularly, produce certificates of good conduct, submit to the domestic and disciplinary regulations, and undergo the monthly examinations on the subjects of the lectures. The only externs dispensed from these conditions are such as have passed through a university course, or who already occupy a public office or who have passed their 24th year. The externs pay as fee for the first and second sessions 50 florins, for the third and fourth 25 florins, together with a half-yearly contribution of 2 florins for the reading-room.

The royal estate of Weihenstephan near Freising has been rented to this Agricultural Central Institution to be managed as a model farm, and also to afford practical instruction. It embraces a very compact area of about 600 Tagwerks, under tillage and pasture, together with a residence and farm buildings, cow and sheep houses. The Institution has in addition a separate experimental field, a large brewery, a nursery, a hop-garden, a Technologicum, a chemical laboratory, a cheese factory, a cabinet of seeds, a collection of implements and models, a library, a dissecting-room and pharmacy for veterinary medicine. Recently the school has received a further extension by the establishment of a separate brewing school, a special course of instruction for the cultivation of fruit, and a preliminary course for practical exercise.

The number of *Eleves* in 1866-67 was 22, of whom 10 were first year students and 12 second year students—the course of study being only 2 years. The number of *Hospitants* or auditors was 38, of whom 22 were juniors and 16 seniors. The total number of students of both classes was therefore 60, of whom 30

were Bavarians, 22 Germans of other states and 8 foreigners (Hungarians, Bohemians, Moravians, and Russians).

The special subjects of instruction for the newly established course of brewing are: Political economy, book-keeping in reference to brewing, chemistry, brewing in its whole extent,—buildings for breweries, heating and management of steam, calculations, drawing, cultivation of barley and hops. Instruction in the use of the microscope and saccharometer, practical exercises in the State brewery.

The special subjects of instruction in Fructiculture are: 1. Fruit-tree cultivation—laying out of nurseries of fruit-trees according to position, methods of rearing, &c.; 2. Fruit-tree nurseries—selection of the proper site for the different genera, and kinds, transplanting, nursing, diseases and accidents; 3. Utilization of fruit—gathering and preservation of fruit; 4. Carpology—systematic division of the genera of fruits, influence of the knowledge of varieties on the spread of the cultivation of fruit.

An Economic garden has recently been established for the most important cultivated plants and their numerous varieties, especially for such useful plants as have hitherto been but little cultivated on a large scale, or which have been suggested for the first time for cultivation. Typical examples of the cultivation of the most important cultivated plants are also shown in this garden, such for example as flax, hemp, madder, tobacco, sun-flower, &c. The work of the garden is performed by the scholars of the preliminary course which has been established for the purpose of exercising the scholars in practical operations and the use of new implements and machines.

The State forests afford opportunity for the practical study of forestry.

The milch cows are of several races, so as to afford an opportunity of illustrating the influence of breeding on their qualities. There are 480 Merino and South Down sheep.

The students practice in the Technologicum, the laboratory, the experimental field and the gardens. They have the privilege of entering the State brewery, and of taking part in the experimental mashes of the technologists. They also make excursions with the technologists to breweries, the sugar works at Regensburg, &c.

The technologists, besides the theoretical instruction in the laboratory, are specially instructed in the analysis of waters, the determination of the quality of barley, malt, hops, and yeast, as well as in the preparation of starch, dextrin, starch-sugar, and in the use of the microscope.

The fructicultural scholars, besides the theoretical instruction which they receive from the several masters, work in the garden, which has an extent of 18 *Tagwerks*, and which contained, deducting thinnings, 260,000 enobled fruit trees of the several genera, sorts and forms. In 1866–67 4 *Tagwerks* were planted out with 60,000 young trees, in part enobled by grafting, in part wild.

The scholars of the preparatory school, besides working in the economic garden above mentioned, are also occupied in the management of the farm yard, &c.; in keeping accounts of articles delivered, and of the receipts and disbursements of all kinds connected with the farm in the day books.

4.—Agricultural Education in the Austrian Empire.

The following complete summary of information respecting the provisions for agricultural education in the Austrian Empire, existing in February, 1868, is taken from a paper published by the Minister of Agriculture: "*Die landwirthschaftlichen Unterrichts-Anstalten der im Reichsrathe vertretenen Königreiche und Länder der Oesterreichischen Monarchie.*" This document was enclosed in His Excellency Baron von Beust's note of June 28th, 1868, to Lord Bloomfield, Her Majesty's Minister at Vienna, and transmitted by the latter to Lord Stanley, Her Majesty's Secretary of State for Foreign Affairs, for the use of the Commission.

There are six superior and intermediate institutions for instructing landed proprietors and large farmers in agriculture, and eighteen agricultural schools chiefly intended for the education of future small farmers, and also for the instruction of the subordinate officers of large estates. There are four special schools for Forestry (*Forstwirthschaft*), six for Viticulture and Fructiculture (*Weinbau, Obstbau*), three for Sericiculture and Apiculture (*Seidenbau, Bienenzucht*), and lastly three Veterinary and Horseshoeing schools (*Thierarzneikunde, Hufbeschlag*). Chairs af agriculture exist in, or courses of lectures on that subject are given at several of the universities, polytechnic institutes, upper gymnasiums, *Real*-schools, &c. In addition to these there are already several Agricultural Schools "for further improvement" (*Landwirthschaftliche Fortbildungs-Schulen*).

The superior schools, the chairs of agriculture, and the special schools are distributed over the whole empire, but the majority of the schools of Husbandry (*Ackerbau-Schulen*) are in Bohemia and Moravia.

Tyrol, the Vorarlberg, Silesia, Istria, and Dalmatia, possess as yet, unfortunately, no institution for agricultural education.

Steps are being taken in Silesia, Bukowina, and Istria, for the establishment of agricultural schools.

Until the erection of agricultural schools in Tyrol, stipends or scholarships out of the educational fund of the country (*Landescultur-Fonde*) are given to young persons to enable them to visit agricultural schools elsewhere. It is intended to do this also in Carniola and Dalmatia.

Superior and Intermediate Institutions for Agricultural Instructions.

The object, plan of study, and conditions of admission for this catagory of educational institutions, are in general the same as are customary for the similar ones in Germany. The course of instruction is completed in from two to three years. A farm is attached to most institutions of this kind, by which the objective instruction is facilitated, and the students are enabled to learn the practice of agriculture.

The Imperial Royal Agricultural Institute at Ungarish-Altenburg.—This Institution ranks first among the Agricultural Institutions of Austria. In 1818 the then owner of the Altenburg estate, Duke Albert Sachsen Teschen, founded an establishment for agricultural education, which was maintained and fostered by the Archdukes Karl and Albrecht. Up to 1848 about 1,000 youths had been educated at the Institution. After that year, the newly created Minister of Agriculture resolved to establish a superior agricultural college for the whole empire. Ungarish-Altenburg was selected for this purpose, not only on account of its antecedents, its favourable position in the centre of the empire, the neighbourhood of numerous well-managed and well-cultiva-

ted estates, but above all, the munificence of the exalted possessor. The new superior educational establishment was opened in November, 1850, and made rapid progress under the management of the former director of Hohenheim, Ministerial Councillor H. W. von Pabst; since 1863 Dr. A. Masch has been director, and Professor Wilhelm Heske agricultural manager. The attendance of students is always considerable, notwithstanding that here more than elsewhere, candidates for admission are unhesitatingly sent away if their previous preparation be deemed unsatisfactory. Since the foundation of the Institute the number of students has been over 1,300. The educational appliances are excellent, part of them attracted great attention at the Paris Exhibition of 1867. For practical instruction there is a farm of 350 Joch, provided with an experimental field, farm offices, machines, workshops, &c. There is also a botanical garden of 12 Joch. The archducal domains are also open to the students.

In consequence of the altered political circumstances, the remodelling of this state agricultural high school, or its removal to one of the Slavo-Germanic provinces may become necessary.

The course of study occupies two years; the number of teachers is ten, the average number of students 130, and the annual cost of maintenance 54,000 florins. The fees, farm, &c., produce 24,000 florins.

The Agricultural Institute for Galicia at Dublany.—This Institution was founded in 1855 by the Agricultural Society of Galicia. Since 1865 the Provincial Diet of Galicia has given it an annual subvention of 5,000 florins, and 10 stipends or scholarships of 100 florins each. It has a farm of 700 Joch, with extensive offices for cattle, and a breeding establishment for negretti merinos, an agricultural botanical garden, and a chemical laboratory. The language of the Institution is Polish. The course of study occupies three years. The number of teachers is eight. The average number of students in attendance thirty-six; and the annual cost of maintenance 8,000 florins.

The Superior Agricultural and Rural-industrial Provincial Educational Institute of Tetschen-Liebwerd.—(Höhere landw. u. landw.-industrielle Landes-Lehranstalt).—This Institution was first founded as an agricultural school in 1850; in 1856 a superior department was added. It was declared a provincial educational institute in 1865. The superior direction is carried on by a council appointed by the Bohemian Government, a member of which, Agricultural Councillor A. E. Komers, acts as director-in-chief, while the duties of local director are performed by Professor Dr. Theodor von Gohren. The language of the institution is German. The course of study occupies three years, and is adapted especially for rural industries. The number of teachers is sixteen; the average number of students in attendance 110; and the annual cost of maintenance 20,000 florins, of which 10,000 are contributed by the State. Since its foundation the Institute has been attended by about 1,000 students. For the purposes of practical instruction, the institution has the farm of Liebwerd, an experimental field, a botanical garden, a nursery for the cultivation of fruit trees (*Obstbaumschule*), and a brickworks; a chemical laboratory connected with a chemico-agricultural station, a technological workshop, collections of all kinds, &c.; finally, the Count Thun-Hohenstein's domain of Tetschen, with a brewery and spirit and liqueur distilleries.

The Superior Agricultural and Rural-industrial Provincial Educational Institute of Tabor. (Höhere landwirthschaftliche u. landwirth.-industrielle Landes-Lehranstalt).—In this Institution, founded in 1866, which is of equal rank with that of Tetschen-Liebwerd, the language spoken is the Bohemian. The town of Tabor purchased land and farmhouses for this Institution at a cost of 51,500 florins, and granted 28,000 florins for its establishment. The course of instruction occupies three years; the number of teachers is 14; the average number of students in attendance 60; and the annual cost of maintenance 18,145 florins. The State gives an annual grant of 10,000 florins. Over 2,000 florins are annually expended for apparatus and other educational appliances. Besides the farm at Tabor, the Institute has an experimental field, a nursery for fruit trees, a chemical laboratory, a meteorological station. There are also available to the students several mills and a brewery at Tabor, several distilleries in the neighbourhood, and adjoining well-managed estates to which excursions are made. The Institute and farm are managed by a director. The general superintendence is in the hands of a council composed of three officials of the town, three professors of the Institute, a member of the Agricultural Society, and the Mayor of Tabor. There is also an inspecting committee composed of three persons, representing the Government, the Town Council, and the Patriotic Æconomical Society.

The Superior Private Agricultural School of Dr. Franz Čupr at Kolčawka. (Höhere landwirthsch. Privat-Lehranstalt.)—At this School, founded in 1856, the course of instruction occupies two years; the number of teachers is 4; the average number of scholars in attendance 45; and the annual cost of maintenance about 5,000 florins. The Institution is in connexion with the farm of the same name, which is the private property of the director, and serves for giving practical instruction and making experiments. It possesses a library of 16,000 volumes, a rich collection of models, a botanic garden, &c. Instruction is given both in German and Bohemian. The fee is 110 florins annually.

A superior Agricultural School was about to be established in connexion with the Technical Institute of Brünn.

The sixth superior Agricultural School is the Operative Department of the *Lower Austrian Agricultural School of Grossau.* The course of instruction occupies two years; there are 7 teachers, who teach both the superior and lower scholars; the number of the former in 1867 was 30.

Schools of Husbandry.

Ackerbauschulen.

The *Ackerbauschulen* belong to the educational establishments intended to provide the smaller farmers and the agricultural population generally with technical instruction. The value of this class of schools is being more and more appreciated, as is shown by the erection of many of them lately, and by the recent debates of the Provincial Diets. Besides practical exercise in farming, the scholars are suitably instructed in the separate branches of agricultural knowledge, their general improvement being also attended to.

The Styrian School of Husbandry at Grottenhof, near Graz.—This School, founded in 1840, was held in Graz until the year 1867. It was supported by the Agricultural Society, the State also giving an annual grant, and fourteen stipends or scholarships. Since then Grottenhof, in the immediate neighbourhood of Graz, has been rented, and the new School taken up by the State. The course of instruction occupies three years; the number of teachers is 3; the average number of scholars in attendance is 30; and the annual cost of maintenance 7,200 florins. There are also four private stipends or scholarships.

The School of Husbandry of Tetschen Liebwerd.—This School was founded in 1850. The course of study occupies two years; the number of teachers is 11; the average number of students in attendance is 24; and the annual cost of maintenance 3,500 florins, of which the State contributes 1,050 florins.

The School of Husbandry of Lower Austria at Grossau.—This School, which was founded in 1857, consists of two departments; the superior one has already been mentioned. The course of study in the ordinary school

extends over two years; the number of teachers is 7; they are common to both departments; the average number of scholars is 50; the cost of maintenance for both departments is 11,200 florins. The State grants 50 stipends. The establishment is on the estate of Freiherr von Villa-Secca.

The Gallician School of Husbandry at Czernihow.—This School, founded in 1860, is a State School since 1866. The course of study occupies three years; the number of teachers is 6; the average number of scholars in attendance 40; and the annual cost of maintenance 5,000 florins.

The lower division of the Croat-Slovenic Educational Establishment at Kreuz.—This School was established in 1862. The course of study occupies three years; the average number of scholars in attendance is 43. We have no information regarding the superior division of the Institution, although in the document from which our information is derived there is a reference to the section on superior and intermediate education, but the name does not occur in it. The Institution is probably analogous to that of Grossau in Lower Austria.

The School of Husbandry of the Circle of Saaz at Kaaden.—This School, founded in 1863, receives from the Circle a subvention of 1,000 florins out of certain funds (*Contributions-Schüttboden* and *Getreide-Geldfonds*). The instruction, which occupies two years, is given in German; the number of teachers is 4; the average number in attendance 20; and the annual cost of maintenance 3,200 florins. Seven stipends have been founded from contributions received from several local sources and private persons. There are also two prize foundations.

The School of Husbandry of Chrudim.—This school established in 1863, receives a subvention of 4,000 florins from the Town Council. The course of instruction occupies two years, and is given in Bohemian. The number of teachers is eight; the average number of scholars in attendance is thirty-two; and the annual cost of maintenance 7,250 florins. A winter course for small farmers was to have been established in 1868. The teachers are bound to give itinerant lectures at meetings of farmers (*Wander-Vorträge*). The school rents a farm of 29 Joch.

The School of Husbandry at Hracholusk, near Raudnitz.—This school was established in 1864 for the circle of Raudnitz. It is maintained by an annual state subvention of 1,000 florins, and an annual sum of 2,500 florins from the quinquennial proceeds of certain funds of the circle (*Contributions-Schüttboden* and *Getreide-Geldfonds*). The course of study occupies two years; the number of teachers is six; the average number of scholars in attendance is twenty-nine; and the annual cost of maintenance 4,000 florins.

The Upper Austrian School of Husbandry at Irnharding.—This school was founded in 1865. The course of study occupies two years; the number of teachers is two; the average number of scholars in attendance is 13; and the annual cost of maintenance 5,500 florins, inclusive of eight stipends of 140 florins each. The school was to be transferred in the autumn of 1868 to some farm to be rented for the use of the school.

The Moravian School of Husbandry at Prerau.—This school founded in 1869, is maintained by the Agricultural Societies of the Circles of Olmütz and Zahleniz-Kwassiz, and by voluntary contributions. The State granted 2,500 florins to establish it, and gives an annual subvention of 1,500 florins. The Agricultural Society of Moravia and Silesia gives three stipends of 50 florins each. The course of study occupies two years; the number of teachers is four; the average number of scholars in attendance is thirty; and the annual cost of maintenance 4,678 florins.

The Carinthian School of Husbandry at Klagenfurt.—This school was established in 1866 by the Agricultural Society of Carinthia. The school receives a subvention of 2,000 florins from the State funds. It is merely a winter school; during the summer the scholars are distributed on well managed farms. The course of instruction occupies two years; the number of teachers is five; the average number of scholars in attendance is fourteen; and the annual cost of maintenance 2,000 florins.

The School of Husbandry of Lobositz.—This school was founded in 1866 on Prince Schwarzenberg's domain of Lobositz. The work of the scholars who are paid as day-labourers covers the expense of their maintenance. The teacher (there is only one) and the teaching appliances are gratuitously provided by the Prince's principal agent Edmund Osumbor. It is, properly speaking, a school for providing properly trained servants for the estate. The course of study occupies one year; and the number of boys attending the school ten.

The School of Husbandry of Neutitschein.—This school was established in 1866, and is maintained by the Agricultural Society of the Circle of Neutitschein. The State gave 2,500 florins to assist in its foundation, and gives an annual subvention of 1,500 florins, and one stipend of fifty florins. The course of instruction occupies two years; the number of teachers is two; and the average number of scholars in attendance twenty-six.

The School of Husbandry and Flax-preparation of Schönberg.—This school was established in 1867 on the estate of Carl Oberleitner. It is maintained by the Agricultural Society of the Circle. The Provincial Diet granted 2,500 florins to set it up, and gives an annual subvention of 1,500 florins. The course of study occupies two years; the number of teachers is four; the average number of scholars in attendance ten; and the annual cost of maintenance 1,950 florins.

The School of Husbandry of Eibenschütz.—This school was founded in 1867. It is maintained by the Agricultural Association of the Circle out of a State subvention of 1,500 florins, and private contributions. The Provincial Diet voted 2,500 florins to set it up. The Agricultural Society of Moravia and Silesia gives three stipends of fifty florins each; and there is one private one of the same value. The course occupies two years; there are five teachers, and on average ten scholars. The annual cost of maintenance is 2,500 florins.

The School of Husbandry of Gross-Meseritsch-Ossowa.—This school was founded in 1867 on the estate of Count Heinrich Haugwitz, who allows the scholars to be practically instructed on his farm. He has also given an experimental field of five Joch, and the necessary buildings at a rent of fifty florins. It is maintained by the Agricultural Association of the Circle, with the aid of a State subvention of 1,500 florins. The Provincial Diet voted 2,500 florins to set it up. The course of instruction occupies two years; the number of teachers is two; the average number of scholars eight; and the annual cost of maintenance 1,700 florins.

The School of Husbandry of Gorz.—This School was founded in 1867, and is maintained by the Provincial Diet. The teaching appliances are provided by the Agricultural Society, which receives a subvention of 500 florins for the cession of the experimental farm. The course of instruction occupies two years, and is given in parallel classes in Italian and Slovenic. There are three teachers; the number of scholars is not given; the annual cost of maintenance is 2,200 florins.

The Æconomic Educational Institute of Znaim. (*Oekonomische Lehranstalt.*)—This School, founded in 1868, is maintained by the Agricultural Association of the Circle, with the aid of a State grant of 1,500 florins and voluntary contributions. A sum of 2,500 florins for setting up the School was voted by the Provincial Diet. It has two stipends of 50 florins each. The course occupies two years; the instruction is given in German and Bohemian. The number of teachers is 5; the average number of scholars in attendance 16; and the annual cost of maintenance 3,000 florins. The director gives field lectures on Sundays to the peasants.

There were in course of erection at the beginning of 1868 the following schools of this class:—One at Capo d'Istria, which is to be maintained by the State; one for the Circle of Teschner, and another for the Circle of Troppau. The Diet voted in 1855 a joint sum of 4,000 florins for the establishment of the two last. And finally, a school was about being erected at Solko, in Bukowina.

Agricultural Improvement Schools.

(*Landwirthschaftliche Fortbildungsschulen.*)

The first of this class of schools, of which so many exist in Bavaria and Würtemberg, was established in 1866 at Mödling by the Agricultural Society of the Circle of that name. The number of teachers is 5, and of scholars 150. In consequence of the success of this School, similar Schools have been set up at Gaaden, Atzgersdorf, Gumpoldskirchen, Neudorf, and Schwarzau. It is the intention to introduce these Schools into Austria generally.

Agricultural Sunday Schools.

The only one of this class of schools in operation appears to be the one established in 1867 on the estate of Ritter von Dombrowski at Ullic, in Bohemia. The course of instruction occupies one year, and there are two teachers.

Travelling Agricultural Lecturers.

Independent of the field lectures given in Bohemia, a plan of giving lectures at farmers' meetings, as in the Grand Duchy of Baden and in Wurtemberg, has been introduced into Tyrol and Salzburg. Instruction in flax-retting has also been given in Moravia by two travelling instructors.

Forestry Schools.

(*Forstschulen.*)

The Imperial-Royal Forestry Academy of Mariabrunn. (K. k. Forstakademie.)—A Forestry School was established at Mariabrunn in 1813. In 1867 this School was re-organized and raised to the position of an Academy of co-ordinate rank with a University. The pass examination is now a substitute for the State examination for foresters. As a rule, those only who have completed their studies at Mariabrunn are admitted into the service of the Crown forests. The neighbouring Crown forest of Weidlingau, containing 3,000 Joch, has been placed under the management of the Academy. A botanic garden of a special kind, extensive collections to illustrate all the principal and collateral branches of the science of Forestry, and a considerable library are also available to students. A Forestry Experimental Station—the first of its kind—and a Physiological Institute are combined with the chemical laboratory. Special attention is devoted to the science of Forest-Engineering. Practical instruction is assisted by excursions and practice in the Crown forests of the neighbourhood. The library is opened for general use. The course of study extends over three years; there are eight professors, and on average seventy-five students. The annual cost of maintenance is 30,000 florins, which is covered by receipts to the extent of 2,900 florins.

The Moravo-Silesian Forestry School at Eulenberg, near Sternberg.—This School, founded in 1852, and maintained by the Forestry School Association of Moravia and Silesia, has four teachers and forty-one scholars, who go through a two-years' course. The annual cost of maintenance is 8,850 florins. It receives grants from the Diets of Moravia and Silesia amounting to the joint sum of 2,415 florins.

The Bohemian Forestry School at Weisswasser.—This School, which was established in 1855, has also four teachers, and on an average seventy-two scholars, who go through a two-years' course. The annual cost of maintenance is 8,000 florins. This School is maintained by the Forestry School Association of Bohemia.

The Eulenberg and Weisswasser Schools are intended to educate private forest administrators, district foresters, and Jägers. The Eulenberg School was formerly at Märisch-Aussee, and was transferred to the present site in 1867.

The Lower Austrian Forestry School at Hinterbühl.—This School was founded in 1865 by the Imperial Society of Vienna. Its object is the education of useful persons for the protection of forests and the technical employments connected therewith, as well as managers for small, especially Communal, forests. The course occupies one year; there are two teachers and twelve students. The annual cost of maintenance is 3,550 florins. There are six stipends of the value of 200 florins.

Inferior Forestry Schools are about to be established at the expense of the State in Upper and Lower Carniola.

Schools for the Cultivation of the Vine and Fruit.

(*Wein und Obstbauschulen.*)

Instruction in the cultivation of fruit trees has been introduced into a great many of the Primary Schools of the different Austrian provinces. In Bohemia, Moravia, and Silesia there are about 3,000 school-gardens for fruit-tree culture. Besides these, there are the following special schools:—

Horticultural and Fructicultural School at Brünn (*Garten und Obstbauschule*).—This school, established in 1850, is maintained by the section of the Moravo-Silesian Agricultural Society, for fructiculture, viticulture, and horticulture. It has two teachers and thirty students, who pass through a course of one year.

School for the Instruction of Gardeners at Lemberg (*K. k. Gärtnerbildungsanstalt*).—The botanical garden at Lemberg defrays the expense of this school. Part of the stipends attached to it are paid by the city of Lemberg and the State. The course of study extends over four years; the number of teachers is three, that of the scholars nine, and the annual cost of maintenance amounts to 1,300 florins.

Instruction is gratuitously given to garden helpers since 1856, by the Secretary of the Bohemian Horticultural Association. The course occupies one year; the average number of scholars is twenty-four.

Lower Austrian School for Fructiculture and Viticulture at Klosterneuburg.—This school, founded in 1860, has seven teachers, and on an average twenty-four scholars, who pass through a two-years' course. The annual cost of maintenance is 12,000 florins, of which the State contribute 5,500 florins; the rest is made up by the convent and the stipends. This school has, in the extensive vineyards, experimental gardens, nurseries, and cellars of the convent, the amplest field for practical instruction. There is also an annual fourteen day course for teachers of primary schools, for which the Lower Austrian Diet has granted ten stipends of forty florins each.

Course of Instruction for the Improvement of Fruit-tree Gardeners (Baumwärter) at Brünn.—This course, established in 1863, is maintained by the section of the Moravo-Silesian Agricultural Society for fructiculture, viticulture, and horticulture. The course occupies one year, and is attended by two scholars. There is only one teacher.

Viticultural School at Krems.—This school was established in 1864. The course of study occupies one year. There are two teachers, and on an average twenty-five scholars. The annual cost of maintenance is 650 florins, which is borne by the Lower Austrian Chamber of Commerce and Industry, and the Communes of Krems and Stein.

A viticultural school was in course of being established at Marburg, and one for the culture of the vine, fruit, silkworm, and bees at Laibach.

Sericicultural and Apicultural Schools.

(Seidenbau und Bienenzuchtsschulen.)

Sericicultural establishment at Baierdorf, near Graz.—This Institution was established by the Styrian Society for the breeding of the silkworm. It is also an apicultural establishment. The course of instruction occupies one year. It has two teachers, and on an average thirty-two scholars. The annual cost of maintenance is 700 florins. The state gives six annual stipends of forty-two florins each.

Apicultural Instruction of the Lower Austrian Agricultural Association at Vienna.—The course of instruction which is given by one teacher occupies one year. The average number of scholars is forty. The instruction is chiefly intended for candidate teachers. It is maintained by the society above-named with assistance from the authorities of Lower Austria, and the members of the society. Courses of instruction in apiculture were also about to be given in the garden of the Theresianum of Vienna during the summer of 1868, and at Innsbruck.

Veterinary Schools.

The Imperial Royal Veterinary Institution at Vienna (K. k. Thierarznei—Institute).—This establishment, which was founded in 1777, consists of three schools—

1. The Veterinary Surgeons' School.
2. The School of Military Veterinary Smiths.
3. The Horse Shoeing School.

The course of study for the surgeons occupies three years, and for the smiths two years. There are six professors, and five assistant professors—two of the latter having the position of free lecturers, as at the universities. The smiths, so far as their education extends, appear to attend the same lectures as the surgeons. The number of students of the latter class is, on an average, 130, and of the veterinary smith class 100. The course of instruction in horseshoeing occupies six months; so that there are two classes each year, consisting on an averege of sixty. The annual cost of maintenance is 65,000 florins. The income of the establishment, as a hospital and shoeing forge, is 22,000 florins. Military surgeons especially are educated at this Institution, which is placed under the Minister of War. Most of the provinces of the Empire send students who receive stipends. The number of stipends paid from state funds at present is seventeen; besides which there are for Tyrol and Vorarlberg four stipends paid out of the educational fund of the province; one for Istria out of the funds at the disposition of the Minister of Agriculture.

The Styrian Horseshoeing and Veterinary Institute at Graz (Steiermärkische Landschaftliche Hufbeschlags- und Thierheilanstalt).—The course of instruction at this institution, established in 1842, occupies one year. There are three teachers, and on an average twenty scholars. The annual cost of maintenance is 2,970 florins; the receipts amount to 2,772 florins. Lectures are given on epidemic diseases, veterinary police, and on agricultural veterinary medicine. Five stipends of 100 florins each are given by the State.

Horseshoeing School at Laibach.—This School, which was established in 1850, combines instruction in horseshoeing with a hospital for animals and a course of instruction in veterinary medicine. The course of instruction occupies one year; the number of teachers is three; the average number of scholars fifteen; and the annual cost of maintenance 1,600 florins, of which the State contributes 630 florins.

Chairs of Agriculture and Lectures in Universities, Polytechnic Institutes, &c.

The chairs of agriculture in several Universities and Polytechnic Institutes date in part from a time when there existed no special practical Agricultural School. Since the year 1865 and 1866 courses of lectures on agriculture have been added in some of the *Real* Schools of Bohemia and Moravia, the instruction given being adapted to the general educational standard of the schools. The scholars are thus prepared for the more advanced instruction of the higher schools, at the same time that the instruction given afford a fair amount of technical knowledge.

In some training schools for primary school teachers, instruction is also given in different branches of agriculture. This instruction is not however deemed sufficient, and accordingly in Gallicia it has been suggested to combine the seminaries for teachers with the agricultural schools.

Chairs of Agriculture in the University and in the Polytechnic Institute of Vienna.—These two chairs are now filled by a professor of the Polytechnic Institute. The latter institution receives in connexion with the chair an allowance of 400 florins for the museum, and 200 florins for excursions. The course of instruction extends over two years; the average number of students attending the course is fifty; and the cost of maintenance about 3,000 florins.

Chair of Agriculture and Estate Management in the Polytechnic Institute of Prague.—The course of instruction occupies one year. We have no information as to the number of students who attend, or about the annual cost of maintenance. Special lectures are also given on Forestry. The institution possesses a very rich cabinet of models.

Chair of Agriculture at the Technical Institute of Cracow.—This chair was established in 1833. The average number of students attending the lectures is eighteen.

Chair of Agriculture in the Technological Institute of Brünn.—This chair was given over to the Institute by the University of Olmütz, and is maintained by the State. The average number of students is thirty-five.

Chair of Agriculture at the Educational Establishment of the Military Administration for the Government of the Frontier.—This chair was established in 1858. The course of study extends to two years and the lectures are attended by twenty-four students. The annual cost of maintenance is 1,600 florins.

Agricultural and Forestry School of the Technological High School of Graz.—A special chair of agriculture was established in this institution in 1865. The class consists on an average of twelve students. The experimental farm of the Agricultural Society in Graz, and the adjoining woods afford a field for experiment.

Agricultural course at the Upper Gymnasium of Klagenfurt.—A course of instruction in agriculture was commenced as early as the year 1808 at the Upper Gymnasium of Klagenfurt. In 1867 the average number of scholars who attended the course was fifteen. The sum allowed for the course is 150 florins.

Agricultural course at the Upper Gymnasium of Laibach.—This course was commenced in 1817, and is attended by seventeen students on an average. The use of the Botanic Gardens is allowed for this course, which costs about 210 florins.

Real School of Rakonitz.—A course of lectures on agriculture, attended by thirty students on an average is given at the Upper *Real* School of Rakonitz. The cost of this course is 600 florins. The Commune has given an experimental field, and established a school for fruit-culture in connexion with the course.

Agricultural course at the Episcopal Seminary of Linz.—This course was commenced in 1808, and is attended by forty-six students on an average. The annual cost of maintenance is 270 florins.

Agricultural course in the Theological Educational Establishment of the Greek Church at Czernowitz.—This course was commenced in 1865, and is attended by twelve students. The teachers receive for the annual course 200 florins from the church funds.

Agricultural Lectures in Salzburg.—In 1867 a course of lectures was established for candidate teachers (on whom attendance is obligatory), scholars of the Gymnasium, and *Real*-School, &c. These lectures are given gratuitously by Professor Woldrich at the experimental farm at Salzburg. There are also excursions and practical instruction given on surrounding farms.

ROYAL COMMISSION OF INQUIRY, PRIMARY EDUCATION, IRELAND.

Assistant Commissioners' Reports.

On the 19th March, 1868, the Commissioners, following the precedents of the similar Commissions which had previously reported to the Crown on the state of primary education in Great Britain, resolved to secure the help of certain Assistant Commissioners in order to carry out a more detailed inquiry into the actual condition of the schools, and the state of primary education in selected districts, which might be taken as specimens of the country at large. The Secretaries were on that day directed to "communicate with Her Majesty's Government, expressing the opinion of the Commissioners, that they would require the aid of Assistant Commissioners for the inspection of schools for primary education in selected districts."

On the 22nd March a letter was received from the Earl of Mayo, requesting information as to the number of Assistant Commissioners that will be considered necessary, the rate of remuneration to be recommended, and the length of time for which it is probable their services will be required.

The Commissioners having adjourned, the consideration of this letter had necessarily to be postponed till their re-assembling on 28th April.

On the 29th April the Commissioners adopted the following resolutions :—

I. "That a letter be written to the Chief Secretary, stating that in the opinion of the "Commissioners eight or ten Assistant Commissioners should be appointed for ordinary "schools, and one for agricultural schools; that they should be employed for *three* "months, and that the Commissioners would at the proper time be prepared to submit "names to the Lord Lieutenant."

II. "That it is desirable in selecting Assistant Commissioners, to secure the services "of gentlemen who have had experience in similar work under the Education Commissions "which have recently reported to the Crown."

III. "That the Commissioners accept with thanks the offer of the Rev. B. M. Cowie "and Mr. Stokes (Royal Commissioners), to inspect and report upon the model, training, "and convent schools."

On Thursday, the 30th April, a letter from the Chairman to the Earl of Mayo, Chief Secretary for Ireland, was approved, stating that—

"Two of the Commissioners, Messrs. Cowie and Stokes, had undertaken to examine "and report upon the training, model, and convent schools."

"The Commissioners consider that for the inspection of the ordinary schools in suffi- "cient number of selected districts, eight or ten Assistant Commissioners will be required "for a period of three months."

"One additional Assistant Commissioner, combining a knowledge of agriculture with "literary qualifications, will further be required for the inspection of the agricultural "schools."

"The Commissioners consider that the remuneration of these Assistant Commissioners "should be at the ordinary rate . . . . . ."

"The Commissioners will be prepared at the proper time to submit for the approba- "tion of the Lord Lieutenant the names of gentlemen whom they consider qualified to "undertake these duties."

On Wednesday, 6th May, the Commissioners settled (having had them under consideration since Tuesday, the 28th April) the instructions to be addressed to the proposed Assistant Commissioners.

A list of gentlemen named as qualified to act as Assistant Commissioners having been read, several of the Commissioners undertook to ascertain if any of those gentlemen would be willing to act if called upon.

The following letter was subsequently addressed to the several gentlemen named :—

Sir,

The Royal Commissioners on Primary Education in Ireland, are about to recommend the appointment of certain Assistant Commissioners to aid them in their inquiry.

The duty of an Assistant Commissioner under this Commission will be, in brief, to conduct a thorough investigation into all the circumstances of Primary Education within a fixed boundary, and to report upon them to the Royal Commission. Full instructions will be issued to the gentlemen selected for the employment.

The time for completing these duties will be limited to three months. The Commissioners consider that ten or eleven weeks should be devoted to local examination, and two or three weeks to the preparation of a report. The Assistant Commissioners will be expected to open their inquiry about June 24th, and to present their report in the course of October.

Should you be disposed to offer yourself for this employment, at the time and upon the terms mentioned above, I request you to forward your credentials to me as soon as possible.

On the 7th May the Commissioners appointed a Sub-Committee to arrange ten districts for inspection by the Assistant Commissioners, each district to comprise not more than 100 schools, and to have not more than four sub-divisions.

On the 8th May it was resolved—

"That the Commissioners accept with thanks the offer of Mr. Dease and Professor "Sullivan to inspect and report upon the agricultural schools."

At the meeting of the Commissioners on the 2nd June, the Sub-Committee above referred to, reported that they had conferred with the Resident Commissioner and the Secretaries of the National Board, upon the selection of districts to be assigned to the Assistant Commissioners, and had settled a list of such districts which they submitted to the Commission.

On Friday, 5th June, the Commissioners proceeded to arrange the names of gentlemen to be recommended as Assistant Commissioners.

On 9th June, a letter was received from the Under-Secretary for Ireland, stating that the Treasury had sanctioned the appointment by the Royal Commissioners of ten Assistant Commissioners.

The Secretaries were directed to write, stating that the Royal Commissioners recommend as proper persons to be appointed Assistant Commissioners under this Commission, the ten gentlemen agreed upon on the 5th instant.

On the 10th and 11th June, the Commissioners settled finally the instructions to be issued to the Assistant Commissioners, and the districts within which their inquiries should be conducted, and then allotted those districts among the proposed Assistant Commissioners.

On the 12th June a letter was received from the Under-Secretary for Ireland, signifying the Lords Justices' approval of the gentlemen recommended by the Commissioners as Assistant Commissioners.

The Secretaries were directed to notify to those gentlemen their appointment, and to transmit to them copies of the necessary documents.

The Commissioners also appointed a Sub-Committee to arrange the details of the districts which have been assigned to the Assistant Commissioners. The districts selected, as finally arranged, and the Assistant Commissioners appointed to them, were as follows :—

1. *Dublin*—Including, as partial centres, Drogheda, Celbridge, Naas, and Wicklow, comprising the Metropolitan Police districts of Dublin, and the Constabulary districts of Rathfarnham, Drogheda, Leixlip, Naas, Bray, Wicklow, Arklow, Tinahely, Baltinglass, and Blessinton, being portions of the counties of Dublin, Louth, Meath, Kildare, and Wicklow.—Thomas King, Esq., M.A., Cantab., Fellow of Jesus College, Cambridge.

2. *Cork*—Including, as partial centres, Bandon, Skibbereen, Kinsale, Middleton, Youghal, Fermoy, Mallow, and Mitchelstown, and comprising the Constabulary districts of the same names, being the greater part of the southern portion of the county of Cork.—W. Scott Coward, Esq., one of H.M. Inspectors of Schools in England.

3. *Belfast*—Including, as partial centres, Belfast, Lurgan, Newtownards, Carrickfergus, Armagh, and Portadown; and comprising the four Constabulary districts of Belfast; the Constabulary districts of Lurgan, Newtownards, Carrickfergus, Armagh, Portadown, and Antrim, being portions of the counties of Antrim, Armagh, and Down.—D. C. Richmond, Esq., M.A., Cantab.; Fellow of St. Peter's Coll., Cambridge; Assistant Commissioner under English Schools' Inquiry Commission.

4. *Londonderry*—Including, as partial centres, Coleraine, Strabane, Letterkenny, and Maghera; and comprising the Constabulary districts of Londonderry, Coleraine, Maghera, Raphoe, and Letterkenny, being portions of the counties of Londonderry and Donegal.—Thomas Sidgreaves, Esq., B.A., Lond., Barrister-at-Law.

5. *Limerick*—Including, as partial centres, Ennis, Kilrush, Newcastle, Rathkeale, and Kilmallock, and comprising the Constabulary districts of Limerick City, Ennis, Kilrush, Newcastle, Rathkeale, and Kilfinane, being portions of the counties of Clare and Limerick.—J. S. Laurie, Esq., formerly one of H.M. Inspectors of Schools for England, and now Director of Education in Ceylon.

6. *South-Eastern*—Including, as partial centres, Clonmel, Thurles, Portlaw, Kilkenny, Castlecomer, Wexford, and New Ross, comprising the Constabulary districts of the same names, being portions of the counties of Tipperary, Waterford, Kilkenny, and Wexford.—P. le Page Renouf, Esq., one of H.M. Inspectors of Schools for England.

7. *North-Western*—Including, as partial centres, Carrick-on-Shannon, Sligo, Ardara, the Rosses, and Enniskillen; and comprising the Constabulary districts of Carrick-on-Shannon, Sligo, Killybegs, Glenties, Dungloe, and Enniskillen, being portions of the counties of Leitrim, Sligo, Donegal, and Fermanagh.—Patrick Cumin, Esq., M.A., Oxon., Barrister-at-Law, late Secretary to the Scottish Education Commission.

8. *West Connaught*—Including, as partial centres, Ballina, Westport, Clifden, and the Island of Achill; and comprising the Constabulary districts of Castlebar, Ballina, Westport, Belmullet, Newport, Clifden, and Tuam, being portions of the counties of Mayo and Galway.—William Jack, Esq., M.A., Fellow of St. Peter's College, Cambridge; Professor of Natural Philosophy in Owen's College, Manchester; formerly one of H.M. Inspectors of Schools for Scotland.

9. *Killarney*—Including, as partial centres, Caherciveen, Kenmare, Dingle, Tralee, and Listowel, comprising the Constabulary districts of the same names, all situated in the county of Kerry.—J. Percival Balmer, M.A., Oxon., Barrister-at-Law.

10. *Central*—Including, as partial centres, Roscrea, Tullamore, Portarlington, Mullingar, Athlone, and Maryborough, comprising the Constabulary districts of Parsonstown, Roscrea, Tullamore, Mountmellick, Maryborough, Ferbane, Mullingar, Longford, Athlone, being portions of the counties of King's, Tipperary, Queen's, Westmeath, Longford, and Roscommon.—Thomas Harvey, Esq., M.A., Oxon.; Assistant Commissioner under the Scottish Education Commission.

Besides the letter of instructions, each Assistant Commissioner was furnished with a set of the Ordnance Maps of the localities included within his district, a classified abstract, compiled from the Constabulary returns, of all the schools within the district, and forms upon which to record the results of the examination in those schools of the children who should be individually examined. He was also provided with printed forms of classified and detailed inquiries, to be made of the teachers of the several schools upon the points to which he was instructed to direct his attention, so far as each individual school was concerned. While the substance of examination was the same for all, each Assistant Commissioner used his own judgment and discretion as to the form of inquiries.

In addition to the information collected from the teachers of the several schools, nearly all the Assistant Commissioners addressed a circular letter to the Patrons, Managers, and influential persons within their district, requesting information and an expression of opinion upon the subjects of their inquiry.

The Commissioners had indicated the 24th June as the date upon which they wished the Assistant Commissioners to enter upon their duties. Within the thirteen days following, eight of those gentlemen had commenced their work. Mr. Richmond, being detained by duties connected with the English Endowed Schools Commission, was not able to come over before the 17th July; and Mr. Cumin was similarly detained in the Education Department, Privy Council Office, England, till the 18th August.

Annexed are copies of the letter of instructions and of the form employed to record the results of an examination of the individual pupils in a school. The classified abstract of the schools of each Assistant Commissioner's district, will be found prefixed to his Report.

In the following Volume the several Reports of the Assistant Commissioners are, for facility of reference, distinguished by characteristic letters, D,* E, F, &c., printed at top of the margin of each page, in the following order:—

D.	Report by	Mr. King	on Dublin	District.
E.	„	Mr. Coward	„ Cork	„
F.	„	Mr. Richmond	„ Belfast	„
G.	„	Mr. Sidgreaves	„ Londonderry	„
H.	„	Mr. Laurie	„ Limerick	„
I.	„	Mr. Renouf	„ South-Eastern	„
K.	„	Mr. Cumin	„ North-Western	„
L.	„	Mr. Jack	„ West Connaught	„
M.	„	Mr. Balmer	„ Killarney	„
N.	„	Mr. Harvey	„ Central	„

The Map inserted in this Volume has been prepared under the direction of Captain B. A. Wilkinson, R.E., the officer in charge of the Ordnance Survey of Ireland. It gives the Districts actually visited by the Assistant Commissioners, distinguished by various colours, and by their characteristic letters, as is explained in the margin of the Map itself.

* This series of letters commences with D instead of A, because the first three letters, A, B, C, have been appropriated to distinguish the special Reports of the Royal Commissioners who visited the Model Schools, Central Training Institution, and Agricultural Schools of the National Board. Their Reports will be found in connexion with the General Report of the Commissioners, Vol. I.

1*st January*, 1870.

Instructions to Assistant Commissioners.

Sir,

The Commissioners appointed by Her Majesty to inquire into "the State of Primary Education in Ireland"—"the practical working of the system of National Education"—and the "measures to be adopted for extending more generally to the people the benefits of education"—direct us to recommend the following instructions to your attentive consideration:—

The objects, which you are to keep in view, are detailed above. In the district to which you are sent, you will make inquiry into the existing means of educating the poor, meaning thereby all who have any claim to assistance from public funds for the education of their children; also into the existing means of educating children of the lower middle class.

You may obtain at the office of the Commission copies of the list already received through the Constabulary Force of all school-houses, and their position within your assigned district. You will visit as many schools as the circumstances of your district will permit, selecting such as will illustrate all classes of schools within the district. The Commissioners consider that you should examine at least *One Hundred* schools. You will make a report on all the facts respecting them, which will aid the Commissioners in judging of the practical working of each class of schools. You will collect evidence from all sources which you deem trustworthy, such as patrons and managers of schools, the clergy of different denominations, intelligent laymen, schoolmasters, the parents of the children, and anyone who may be willing to help you in forming conclusions as to the needs of the district, and the ways in which they are or may be supplied.

You will have no power to compel answers to your inquiries; but you may assure all who may be reluctant, that the Commissioners will scrupulously respect all private interests.

The extracts from the Census Returns, which will be supplied to you from this office, will give you full information as to population, and the number and age of children who ought to be at school; and you will, therefore, be able to arrive at definite conclusions on the adequacy of the school accommodation. When you have ascertained with accuracy the amount of accommodation already afforded, the number of scholars in attendance at the time of the inquiry, their ages and the average period of their attendance, you will have to examine carefully the Registers of National schools and other schools, to see whether there are periods of the year when the schools are better filled than at other times, and you will inquire into the local causes for the variation in attendance.

If you find that there is more room for scholars than is filled by scholars, you will inquire whether this is owing to a superabundance of school buildings in the district, or to the indifference or neglect of parents to send their children; in the latter case, you will endeavour to ascertain whether they, being willing, are prevented generally by the influence of others, or whether they are actually themselves unwilling to send their children to the schools which the Government or other bodies maintain. You will then endeavour to ascertain the particular reason of their unwillingness.

Some of these reasons may be—distance of schools from their habitation; the amount of school-fees; want of confidence in the skill of the teacher; religious and conscientious scruples; the necessity of securing all that the children can gain in wages, or the help they give to their parents in their trades or employments.

You will ascertain whether the industrial occupation which prevails in the district is one which causes the attendance of children at school to vary at particular seasons.

If the average period of attendance for each child varies in different schools, you will try to find out the reason of this difference; especially, it will be important to notice the effect of the establishment of large works in the district, in increasing a demand for education, or in reducing the number of scholars, distinguishing between the results due to different kinds of manufacturing industry.

You will notice any plan proposed to you for securing increased or more regular attendance, and invite suggestions on this point. These you should weigh and endeavour to test by inquiry on the spot.

If the school accommodation is insufficient, you should inquire into the cause of this deficiency, and state whether there is any local aid to be expected in providing proper and sufficient schools.

If any statement is made to you of abuse or misapplication of Government aid, you will record it, and inquire into the truth of the alleged misapplication.

You will also make yourself acquainted, as far as you can, with the efficiency of schools unaided by the State, and compare them with the Government schools.

With respect to subjects of instruction, the Commissioners wish that the proficiency of the children in Reading, Writing, and Arithmetic, should be ascertained as closely as possible, that the relative proficiency of children of different ages should be noted, and then that the general intelligence of the children and their power of expressing themselves correctly on the matter within their course of instruction should be tested. You will examine into the proficiency of the children in the other subjects in which they are instructed.

You will report on the size, condition, ventilation, and lighting of the school buildings; the desks and apparatus; the supply of books, &c., and the condition of out-buildings.

You will particularly notice in a crowded school-room whether the cubical contents of the room are sufficient to make it reasonably healthy.*

You will report in every case whether a residence (rent-free or not) is provided for the teacher of the school; if not, the expense incurred by such teacher for residence.

You will report on the method and the hours adopted for Religious Instruction; if the school be a National school, whether the Rules of the National Board are strictly observed or not; whether any statements have been made to you as to these Rules being inapplicable to the circumstances of that particular school.

It is extremely important to verify the statements as to the extent to which mixed education prevails, and report any facts which bear on the question whether the effect of mixed education is beneficial or not.

You will therefore carefully examine in each school you visit, the return as to the number of children of different religious denominations.

You will pay the more careful attention to this point, if you remember that there is great difference of opinion on the degree of success attained by the National Board in their effort to carry out a system in which children of different religious denominations are educated together.

The actual state of things in this respect is to be acertained in your district chiefly by your personal and careful inquiry; and the Commissioners request that you will take no returns for granted which you can personally verify.

Are the teachers' salaries sufficient? Are the National schools too numerous in any part of the district, considering the cost thrown upon the Government? Ascertain the amounts and rate of school-fees, how they are expended, whether any gratuitous education is given; whether the effect of such gratuitous education is beneficial or not; whether the fees are the same for all ages or not, whether any endowment (fixed or removable) exists, and the amount of any local subscriptions.

Is the education given in each school suitable for the class of children for whom the school is intended?

Report on the tenure of the school-houses in connexion with the National Board; whether any change in the tenure has taken place since the school was taken into connexion, and what was the character of the change, if any.

Distinguishing between vested and non-vested schools in connexion with the National Board, report on the state of repair of the premises, giving where needful the full particulars of any recent expenditure on the school-houses under this head.

Ascertain when the Inspecting Officer of the Board of Works last visited the school-buildings, in the case of vested schools.

Report on the general efficiency of school-teachers within the district, distinguishing those who are in the service of the National Board, and their grade (see Rules and Regulations, Part IV., iv., 1); also of monitors and pupil-teachers.

Find out what occupation they followed before they became teachers; whether they follow any occupation besides teaching at the present time; whether the teachers who have been trained are superior to others; whether they teach subjects not generally required, or give too much time or attention to their more advanced pupils.

Is there any difficulty in the district in obtaining monitors and pupil-teachers?

In the case of children of both sexes attending one school, is the popular feeling in favour of the head teacher being a master or a mistress?

If there are evening schools or infant schools, or ragged schools, within your district, you will report on them under separate headings.

You are not expected to visit or report upon Training, Agricultural, or Model schools.

* The minimum allowance of space in the Regulations and Rules in England (Rev. Code, 51 *a*,) is 80 cubic feet for every child in average attendance. The Rules of the National Board II., § ii., 3, only refer to *area*, and not to cubical content, and require eight square feet.

With respect to the appointment or dismissal of teachers (including monitors) in National schools, endeavour to ascertain what has been the practice during the last three years :—

(*a*). As *to appointment.*—Whether the persons appointed have proved competent; whether they have been appointed for their supposed efficiency; whether they have been trained in Dublin.

(*b*). As *to dismissal.*—Report specially on the circumstances in every case that comes within your knowledge; you will inform those who give you the details, that no names will be published, and that if the circumstances require it, the Commissioners will not publish the particulars.

You will avail yourself of all assistance which the National Board Inspectors can give you, but you will, at the same time, remember that as your duty, in a great degree, requires you to form an independent opinion on the efficiency of the National system, you must not allow yourself to be influenced by their opinions, or guided by their advice in those matters in which the Commissioners look for the result of your own judgment.

These Instructions are to help, not to limit your inquiries. Any special facts which may come under your cognizance, and which you may think material for the purposes of the Royal Commission, should be reported by you, especially if they bear on some of the questions referred by Her Majesty to the Commissioners, although such questions may not have been specifically referred to in these Instructions.

By order of the Royal Commissioners,

GEORGE A. C. MAY,
D. B. DUNNE,

Secretaries.

N.B.—In another paper you have pointed out to you the principal stations within your district where inquiry should be made. You will have to inspect schools of all classes, country and town schools, and schools under various management; and you must endeavour in your final report to give a fair and accurate account of the general state of the education in your district, viewed in all its aspects.

Paragraph

INTRODUCTION.

Nature and extent of districts selected for examination, 1–5

PART I.

METHOD OF INQUIRY AND GENERAL RESULT.

Subjects of inquiry, 6
Method adopted in rural districts, 9
not applicable in Dublin, 9
General summary of results, 10
Schools which come within the scope of the inquiry, either aided by the State or independent, 11, 12
The former distinguished by an attempt to promote united secular and separate religious instruction, 15
Regulations enforced with this object, 16
obeyed, but generally disliked, 17
Various kinds of private schools, 18
Course of secular instruction the same in outline, 21
System of the National schools, 22–27
" Christian Brothers' schools, 28, 29
" Parochial and endowed schools, 30–37
National teachers, how trained, classed, and appointed, 38–41
Amount of salary; general dissatisfaction on this account, 42–44
Parochial teachers contrasted with the National teachers, 45, 46
Class of children in attendance at Primary schools, 47
Period and regularity of attendance, 48
Suggestions for improvement in these respects, 49
Religion of the scholars, practically no mixed education, 50
Opinions of the clergy; popular feeling, 51, 52
School buildings generally inferior, 53
National schools very deficient in this respect, in consequence of the want of local support, 54–57
General want of accounts of expenditure on the school buildings, 58

PART II.—DETAILS OF INQUIRY.

SECTION I.—Drogheda, 59–96
Population: number of children of school age, religion, &c., 60–66
The means of education provided for the poor insufficient, 69
Large number of adventure schools—description of one of these, 70
St. Peter's National convent school, 71–74
Christian Brothers' schools, 75–81
St. Mary's National schools, 84–87
" National convent schools, 88
Protestant National school, 90, 91
Parochial and Blue schools, 91–95

PART II.—SECTION II.

Districts of Naas and Leixlip, 97–153
Population, &c., of Naas town and parish, 100, 101
Naas National school, 103–106
Sallins National school, 107–109
Naas convent school, 110–113
Irregular arrangement of this school adopted in order to separate the poorer children from the rest, 110, 111
Naas Parochial school, 114–116
District in the neighbourhood of Naas, 117–135
Schools situated at—
Johnstown, 117
Kill, 118–124
Tipperkevin, 125, 126
Ballymore Eustace, 127–130
Kilcullen, 131–135
District of Leixlip, 136–153
Celbridge, 140
Parochial school, Irish Society's school, 141, 142
Celbridge National day and evening schools highly efficient, and receive considerable local support, 143–147
Leixlip Parochial school, 143
Maynooth Parochial school, 149, 150
" National school; National convent school, 151–153

Paragraph

PART II.—SECTION III.

County of Wicklow, 154–196
Wicklow town, population, &c. 156, 157
Neglected state of the National school, 158
Parochial school, 159
Schools in the neighbourhood of Wicklow—
Glenealy, 161, 162
Rathnew, 163–165
Disgraceful neglect of the National school, 163
Ashford, 166
Ballylusk, 168
Schools in the Mountain district—
Enniskerry, 171–173
Lady Monck's schools, 174
Annacarter National school, 175
Roundwood, 176
Rathdrum, 178–181
Glenmalure, 182
Glendalough, 183–189
Remarkable circumstances of the schools in this place,
Favour shown by National Board to one of the schools; opposition by the Roman Catholic clergy, 183, 184
Great negligence on the part of the manager with respect to the other school, 185–188
Shillelagh—
Earl Fitzwilliam's school, 191–195
Parochial school, 196, 197

PART II.—SECTION IV.

1. *Dublin.*

Extent of the district, number and condition of the population, 198, 199
Number of scholars, &c., 200–203
Regularity of attendance, 204
Proportion of scholars to population of each religion, 205, 206
National schools attended almost exclusively by Roman Catholics, 207
Insufficiency of existing schools, 209–214
Obstacles to the spread of education, 215

PART II.—SECTION IV.

2. *Schools in North Dublin.*

Distribution of National schools not entirely in accordance with the distribution of the population, 219
Schools in the eastern part of the district—
St. Patrick's National, 220–226
Gloucester-street Scriptural, 227–229
Summer-street Scriptural, 230, 231
Schools in the Parish of St. Mary—
Denmark-street National, 235, 236
Bolton-street National, 237
Error in the police returns with regard to this school, 237
Josephian National, 238–240
Mountjoy-street Scriptural, 241–243
St. Mary's Parochial, 244–247
Schools in the Parish of St. Michan—
St. Michan's National, 249–255
St. Michan's Parochial, 256
Schools in the Parishes of St. Paul and Grangegorman—
St. Paul's National, 260–263
Blackhall-place National, 265, 266
St. Paul's Parochial, 267–269
Manor-street National, 270–274
Phibsborough National, 275–280
General conclusion as to the state of the schools in the district, 281

PART II.—SECTION IV.

3. *South Dublin.*

	Paragraph
Subdivisions of the district,	282
Schools in the western central district—	
Whitefriar-street National,	285–289
St. Bride's National,	290–293
SS. Michael and John's National day and evening,	295–301
St. Audoen's National,	303–305
St. Catherine's,	306–312
St. Nicholas',	313–317
Other schools in the district,	318
General conclusion as to the state of the National schools in the district,	319
St. Peter's Parochial school,	321–327
St. Nicholas and St. Luke's,	328–332
St. Catherine's,	333–335
St. Michael's,	336–338
St. John's,	339–343
St. Patrick's Deanery School,	344, 345
Knight's Endowed School,	349, 350
General conclusion as to the state of the parochial schools,	351–353
Eastern central district—	
Lombard-street National school,	355
Irish Church Mission schools,	356–359
St. Anne's Parochial schools,	360–363
Other schools in the district,	364
Private school in Moss-street,	365, 366
Suburban district—	
Ringsend National school,	368–376
Peculiar circumstances of this school,	368
Irishtown National school,	377–381
Donnybrook parochial school,	382–385
Harold's-cross National school,	386–388
St. Clare's National school,	389–391
Ralph Macklin's Endowed School,	392–394

PART II.—SECTION V.

Kingstown, Monkstown, &c.

	Paragraph
Population and number of scholars,	396
Large number of superior schools in this district,	397
Booterstown National school,	400
Booterstown National convent school,	401
Booterstown Parochial school,	402
Blackrock National school,	403–405
Carysfort Parochial school,	406
Kingstown—	
Christian Brothers' school,	407, 408
National convent school,	409
Monkstown parochial school,	410
Glasthule parochial school,	411
Account of the Inspector's visit to this school,	412
Stillorgan parochial school,	413, 414

PART III.

Workhouse schools,	415–417
Naas Workhouse school,	418
Drogheda Workhouse school,	419–421
North Dublin Union Workhouse schools,	422–425
South Dublin Union Workhouse schools,	425–435
Conclusion,	436–438

APPENDIX I.

	Page
Answers to circular of inquiries,	65–72

APPENDIX II.

Abstract of statistics relating to schools in Dublin visited,	73

APPENDIX III.

Original documents relating to various schools,	82

REPORT of THOMAS KING, Esq., Assistant Commissioner.

---

1. MY LORDS AND GENTLEMEN,—I have the honour to submit to you my report on the state of primary education in those districts in which, by your direction, I have made an inquiry during the past summer.

2. These districts are—Dublin and the portions of its suburbs contained in the Metropolitan Police district, and the Constabulary districts of Drogheda, Naas, Leixlip, and Wicklow.

Districts originally selected for examination,

3. The Metropolitan Police district of Dublin extends very little beyond the city on the north and west, Glasnevin, Castleknock, and Inchicore being the extreme points in these directions; on the south, however, the district includes Kingstown, Dalkey, and the suburban villages between these places and Dublin.

4. The district of Drogheda includes the town only and none of the adjacent country. The town is a thriving sea-port with considerable trade, and possesses some manufactories in which large numbers of boys and girls are employed. The districts of Naas and Leixlip are chiefly agricultural. The former contains the town of Naas with 3,000 inhabitants and the large village of Ballymore-Eustace, in which there is a factory. The district of Leixlip contains the large village of the same name, and the small towns of Maynooth and Celbridge. Many of the inhabitants at Maynooth gain their livelihood by supplying the wants of the students in the college, and the children are very early apprenticed to their parents' trades. At Celbridge and Leixlip there are factories in which children are employed. These districts include some of the most fertile parts of the county of Kildare. The land is chiefly pasture, and, I believe, divided into large farms; at least it is significant that many of the children in the schools described their parents as farm labourers. The district of Wicklow is also chiefly agricultural. In the town of Wicklow and its immediate neighbourhood, many of the inhabitants are engaged in the fishery. In the neighbourhood of the sea the land is flat and is well cultivated, but on the hills there is a good deal of waste land, and the population is very thin and scattered. Besides the town of Wicklow, the only considerable collections of houses are the villages of Rathnew and Ashford in its immediate neighbourhood, and Roundwood which is situated at some miles distance on the hills. The condition of the population in this county seemed on the whole much the same as in the county of Kildare, though not quite so prosperous perhaps in the hilly part of the country.

to which a part of the county of Wicklow was afterwards added.

5. These were the districts assigned to me when I was appointed to conduct the inquiry for the Royal Commissioners. When I had nearly completed my examination of them, I was requested to extend my observations over a considerable portion of the county of Wicklow which had not been included in the district originally selected. The places to which my attention was especially directed were, Rathdrum, Glendalough, and Shillelagh. The peculiar feature of this district which distinguishes it from the part of the county which I had already examined, is the tract of land in the neighbourhood of Glendalough where the large works of the Mining Company of Ireland give employment to many of the inhabitants. I was so fortunate as to obtain assistance which enabled me to undertake this additional labour.

PART I.—METHOD OF INQUIRY AND GENERAL RESULT.

Subjects of inquiry.

6. The principal subjects of inquiry mentioned in the instructions I received were (1) the sufficiency of the existing means of educating the children of the poor; (2) the extent to which the means were supplied by the State schools; (3) the actual working of the schools, whether supported by the State or by private persons.

7. On the third point it was comparatively easy for me to satisfy myself by personal observation. I examined a considerable number of schools, and attempted, with more or less success, to discover the estimation in which the schools were held by persons who took an interest in the education of the poor.

Method adopted in rural districts

8. The want of information as to population, and the number of children of school age in the different parts of the district, rendered the investigation of the other two points more difficult.

9. The method of proceeding which I adopted was this:—I visited a large number of schools in all parts of the districts, including representatives of every kind of primary school. I observed whether the accommodation afforded was properly used; I endeavoured to ascertain what proportion of children in the neighbourhood of each school was habitually in attendance, and the causes of absence or infrequent attendance. In the country districts the schools are numerous, small, and at no great distance from each other; and generally each school was attended by those children only who lived in its vicinity. The local managers of schools and other persons who gave me information were so intimately acquainted with the circumstances of their neighbourhood as to make their statements most valuable. Besides, in those places which I visited I had abundant opportunity of observing whether many children were working in the fields or straggling about the roads and villages during school hours. Thus by comparing the results of my own observation with the answers to my inquiries given by persons who were able to give trustworthy information, I formed a definite opinion as to the adequacy of the school accommodation and the use which the inhabitants made of the schools within their reach. For Dublin, however, I was obliged to adopt another plan of investigation. The number and variety of schools rendered it impossible to assign districts to each, and I soon discovered that the children in attendance at the different schools were not necessarily inhabitants of the immediate neighbourhood. The managers of schools, clergymen, and other persons whom I consulted, did not venture to make any but the most general statements as to the condition and occupation of the population, the number of children of school age, and the number of scholars in these districts with which in the discharge of their duties they had become well acquainted. Had I obtained full and precise information on all these points, it would still have been necessary to visit all the schools

not applicable in Dublin.

in order to estimate the amount of accommodation that was provided. I concluded that the only facts which I could ascertain by personal inquiry or observation were the number of children in attendance or on the rolls of schools which I visited, the accommodation afforded by the school buildings, the sufficiency of the teaching staff. By visiting a large number of schools I endeavoured to obtain a sufficient experience to enable me to judge whether the existing means of education are suited and adequate to the requirements of the scholars in attendance, and whether they are used to the fullest extent possible. One most important fact remained to be investigated: the proportion of children of school-going age who were nominally or actually in attendance at school. From the census returns an approximation of the number of children of school age can be made, and the returns sent by the police and constabulary of the number of children actually in attendance at school on the day of their inquiry may be supposed to give a fair estimate of the number of scholars. A comparison of these returns renders it possible to form an opinion as to the number of children who are not at present receiving instruction.

General summary of the results of my inquiry.

10. Before I proceed to describe in detail the results of my investigation it may be desirable to give a summary of the conclusions at which I have arrived:—

(*a.*) In the country the schools are quite sufficient for the actual and possible wants of the population, but are not too numerous. In Dublin and in some of the towns an improvement in the regularity with which most of the scholars attend school would render necessary an increase in the school accommodation at present provided.

(*b.*) In the country the National schools are attended by the great majority of the scholars, and other schools are comparatively unimportant, but in Dublin the independent schools take as large a share of the work of educating the poor as the National schools: the latter are, however, especially frequented by children of the poorer class.

(*c.*) The attendance in the country schools, except at certain seasons, is as regular and as large as can fairly be expected: in the towns and in Dublin the irregularity with which many of the children attend school is very great, and this obstacle to education is especially felt in the poorer districts.

(*d.*) The National schools alone are professedly undenominational, but the simultaneous presence in them of children of both religions, Protestant and Roman Catholic, is very rare.

(*e.*) The course of secular instruction given in all schools is much the same, and includes little beyond the most necessary elements of knowledge. In the National schools a better use might, perhaps, be made of the time spent in teaching grammar.

(*f.*) The teachers of National schools are, as a rule efficient, and their efforts are much aided by the excellent and cheap series of school-books provided by the National Board, and the supervision of the Inspectors. In many of the private schools the teachers are inferior, and in very few is the work of instruction so systematically and thoroughly performed as in the National schools.

(*g.*) The National school buildings are generally very bad, in some cases quite unfit for the purpose of a school; the private schools are, in this respect, superior.

(*h.*) Little or no interest is taken by any persons, except the clergy, in the work of education; and very little local aid can be expected for schools which do not appeal to the religious prejudices of the population for their support. The consequences are seen in the wretched buildings of National schools, and the very low salaries of the teachers who, for the most part, receive little beyond the stipend paid by the National Board.

Schools which come within the scope of the inquiry,

11. Lists of schools situated within the district were supplied to me on commencing my inquiry. The Dublin list included every school in the city and suburbs, but the country lists contained those schools only which could be fairly considered to come within the scope of the present inquiry. From the Dublin schools I found that it was only necessary to select those which were returned as being maintained by external aid in addition to the payments of the scholars.

either aided by the State or independent.

12. The schools can be divided into two classes—those which receive aid from the State, and those which are supported by private liberality. The first class includes all schools commonly called National schools; schools in the second class have no general name, but may be called "private schools."

13. The National schools are comprised under the following classes:—

Various classes of National schools.

(1.) The model schools.

(2.) Convent schools, properly so called, in which the instruction is given by members of a religious order, with the assistance of monitresses only. There are ordinary National schools attached to convents, in which the religious instruction is given by the nuns, but the secular instruction is given by a mistress classed and paid according to the regulations of the National Board.

(3.) Workhouse and prison schools.

(4.) The schools commonly called National schools.

Vested and non-vested schools,

14. The National schools are either vested or non-vested. Vested schools have been conveyed to the Commissioners of National Education or to trustees, and are subject to a nominal rent. The necessary repairs of the buildings are undertaken by the Commissioners or the trustees, and in the case of new schools the Commissioners contribute to the erection of the building. The local manager of the school is appointed by the Commissioners or trustees, and they have the right of a veto on the appointment of the teachers, and of dismissing teachers whose conduct they may consider unsatisfactory. In non-vested schools the buildings are maintained by the local manager without assistance from the Commissioners. The aid is limited to the salary of the teachers and monitors, and the supply of books at a cheap rate. The Commissioners do not interfere in the appointment or dismissal of the teachers, which are in the power of the local manager, except that they reserve the right of withdrawing their contribution towards the salary of a teacher whom they consider unfit for the post.

all distinguished by the regulations with regard to religious instruction.

15. The distinguishing feature of the schools aided by the State is their government by rules framed by the Commissioners, with the object of rendering it possible to give united secular instruction to children of all religions, whilst due provision is made for the religious instruction of children whose parents desire it. In private schools no attempt is made to separate the religious and secular

instruction; on the contrary, in the great majority of those schools all the scholars, no matter what their creed or their parents' creed may be, are compelled to receive the religious instruction given at the school.

16. In the State schools religious instruction can be given during one intermediate period of the school-day only, though prayers are permitted at the commencement and close of the day; but at any other time all allusion to religious subjects or exhibition of religious emblems is strictly forbidden. The observance of this rule is compulsory in all schools, whether attended by children of different religions or of the same. At the time of religious instruction and during prayers a notice to the effect that religious instruction is in progress must be exhibited in the room, and, by the Rules of the National Board, no child is allowed to be present unless the parents have given permission when they first entered the child's name on the school rolls. The instruction is in accordance with the creed of that communion which the local manager may choose; but in vested schools ministers of religion or other fit persons approved by the parents are to be allowed at convenient times to visit the school, and give instruction to those children who are members of some other religious body. In non-vested schools no provision is made for giving religious instruction to children who do not receive that given in the school.

Opinion of Roman Catholic school managers as to the effect of this regulation.

17. I never heard any complaint made of the non-observance of this rule, but I found that very few persons were satisfied with it. The parish priests and other Roman Catholic clergy who form the great majority of the local managers of the State schools, almost without exception objected to the universal application of the rule. The general state of opinion among them may, I think, be fairly stated as follows :—The rule restricting all religious instruction to one period of the day only, and forbidding any allusion to the subject at other times except the commencement or the close of the day, is very prejudicial to the religious training of the school children. The effect of its observance is to create an impression in their minds that except on certain occasions religion itself may with advantage be forgotten altogether, and that its outward expression should be as much as possible avoided in order not to shock persons of a different creed. The object of the regulation is to protect children of various creeds from any attempt at interference with their belief, and in schools attended by Protestants as well as by Roman Catholics, some provision of the kind may be required. The experience of many years, however, has shown that in the towns and in country places where denominational schools are established, most of the National schools are attended by Roman Catholics exclusively. If the regulation were suspended in such schools no one would suffer. Of course if this were done the difficulty of again enforcing such a rule would render the admission of Protestant children to these schools for the future impossible; but, as hitherto they have never wished to attend, it is not unreasonable to suppose that regulations enforced for their benefit are superfluous.—The practical change which I believe it is wished to introduce in the National schools, and which the existing regulation prevents is the decoration of the schoolrooms with statues or pictures of sacred subjects, and the occasional interruption of the secular work for a short devotion. The few Protestant managers of National schools said that they were quite satisfied with the working of the present rule. By persons who were opposed to the National system of education and supported or managed private schools I heard other objections urged against the regulation which appeared to be the cause of their dislike and opposition to the National system. The supporters of the parochial schools said with almost perfect unanimity that no system of education could be tolerated that was not founded on a Scriptural basis. The meaning of this phrase I gathered to be, that all children should be forced to read Scripture daily in the schools. They thought that it was wrong to forbid allusions to religion during the course of the secular instruction, and that the clergyman ought to be allowed to visit the school for the purpose of giving religious instruction at all times.

Of opponents of the National system.

Various kinds of schools unaided by the State.

18. In the private schools, therefore, as may be inferred from what has been said, there is no restriction on religious instruction. These schools are of three kinds:—

(*a.*) The Christian Brothers' schools, which are conducted by the members of a Roman Catholic religious community.

(*b.*) The parochial schools, all of which are in connexion with the parish and district churches of the Established Church and are managed by the clergy.

(*c.*) Endowed schools, most of which are on the foundation of Erasmus Smith. Besides these there are a few in Dublin, such as Ralph Macklin's school, Knight's Endowed school, St. Patrick's Deanery school, and others, and one in Drogheda—the Blue school—now united with the parochial school. All these are Protestant schools under management of Boards of Trustees, who are exclusively Protestants.

Practice with regard to religious instruction.

19. In the Christian Brothers' schools the time actually devoted to religious instruction is not longer than in the National schools, but at certain hours of the day the secular work is suspended for a few moments and a short prayer is said. The school-rooms also contain statues or pictures of a sacred character. At the schools which I visited I was told by the Brothers that if a Protestant child came to the school they would not refuse him admittance nor compel him to be present at religious instruction, or to take part in their devotions, but that they should not alter their own practice on his account.

20. In the parochial and foundation schools all scholars must read the Scriptures daily. In most schools the Church Catechism is taught, but only to children who are members of the Established Church, or whose parents have no objection. The teachers may introduce remarks of a religious nature at any opportunity during the secular work, and the clergyman can come at any time to give instruction. I did not find that this liberty was used by either. There was generally one day during the week on which the clergyman gave instruction, but on other days he did not interfere with the working of the school.

Course of secular instruction

21. The course of secular instruction is much the same in all schools. Reading, writing, and arithmetic are the chief subjects; to these in the National schools are added English grammar and geography; in the private schools history is also taught. Plain and fancy work is taught in the girls' schools, and in the convent schools singing. Drawing is taught in some National schools, but not during the regular school-hours. Vocal music is taught in all the Christian Brothers' schools which I visited. Latin, French, Euclid, and Algebra were taught in a few of the more pretentious schools.

in National schools regulated by the Commissioners.

22. The Commissioners of National Education have drawn up a programme of instruction for National schools, by which the division of the school into classes, and the degree of proficiency to be expected from each class is regulated. The programme states the minimum degree of proficiency to be required from scholars in each class. I found that the schools followed the programme exactly, with this exception, that the scholars in the lowest division of each class did not come up to the standard required, and that this failure was especially remarkable in arithmetic. The books used are published by the Commissioners at very low prices, and the supply was generally sufficient. Reading is learnt and practised in the books of reading lessons, of which there is a graduated series, each class having its own book of reading lessons.

Books used.

23. The First Book is most elementary; beginning with the alphabet, it contains very few words of more than one syllable. The most difficult lesson in the Second Book is a selection from Robinson Crusoe, in which the original text has been altered by simplifying the words. The lessons are said to be arranged in order of difficulty; but the arrangement has been so much changed, in successive editions of the book, as to cause considerable confusion in schools when the children's books were not all of the same edition. I found that the book was not generally read through; the majority of the children in the second class could only read the first few lessons, and the highest division of the class had seldom read much more than half the book. Reading in this class was nothing more than a puzzling out of the words, or a repetition from memory, except in the case of the scholars in the highest division who could generally read a sentence without stopping at every word of any length or difficulty. The Third Book contains a selection of passages which bear some marks of adaptation for inexperienced readers, but their language is not very different from that in common use. I found that this book also was not usually read through. But whereas, in the second class I not unfrequently noticed that the child instead of reading, was repeating the sentence; the portions of the Third Book which had been used had not been read over so frequently as to enable the scholars to know the passages by heart. The use of a portion only of these books is due to the very general practice of making the scholars in the higher classes return to the beginning of the book, or to that part of it which the new members have read, whenever a promotion is made. The Fourth Book contains passages from well-known authors, interspersed with scraps of science, history, and geography, such as might have been selected from any popular treatise. Scholars in this class could read any portion of the book with ease and fluency, though without much expression or intelligence. I found, however, that they understood what they read much better than their manner of reading seemed to indicate.

24. The scholars were always well supplied with books even in the poorer schools. It was very seldom that the teacher was obliged to lend copies of the lesson book when a class came up to read to me. The books were the property of the children, and might be taken away from the school.

Handwriting good, spelling indifferent.

25. Writing in copy-books is practised by all classes except the first; the third and fourth classes in all cases, and sometimes the higher division of the second, are in the habit of writing from dictation on slates. Where the second class children did not write from dictation they were accustomed to copy a few sentences from their book of reading lessons. The handwriting on the copy-books was very good, and the dictation exercises were in nearly all cases well written, but the spelling was generally deplorable. The dictation exercise which I frequently gave to the third class was this—"No animals are more common than spiders, we find them everywhere. Some have their dwelling in our houses, some in the fields, some in the crevices of an old wall, some float on their web in the air." I generally gave out the passage myself, but occasionally I asked the teacher to do it, thinking that my English pronunciation might be the source of the errors in spelling. The result, however, was the same; many children could not write the sentence without making at least four mistakes. The word crevices they could hardly be expected to know, but the other words are tolerably familiar. The children in the second class also, in copying words from their lesson-book were very inaccurate. The scholars in the fourth class generally wrote from dictation on paper, but in a few cases they gave in their own words the substance of a lesson they had lately learned.

Imperfect method of teaching arithmetic.

26. Arithmetic is the subject taught with the least success. Numeration seems to have been forgotten; the simple rules, except long division, are tolerably well known; the compound rules are supposed to relate to money only, and are practised before reduction has been learned. The rule of three is called proportion, but is taught in the vicious way indicated by the former name; a question that would have been called formerly in England an example of the rule of three inverse was very seldom worked correctly by the scholars, because they had never understood the principles of the rule. Practice, both simple and compound, is learned by scholars in the fourth class, but compound practice is limited to questions involving the price of quantities expressed in avoirdupois weight. These sums were worked by a method which I had never seen before, and which no one was able to explain satisfactorily. In a few schools the most advanced scholars could work sums in simple interest. I found that it was useless to ask any of the scholars to try to work a sum that was not a direct example of a rule he had learned. Indeed, the conclusion that I have arrived at with regard to the teaching of arithmetic is, that no attempt is made to show the children the reason of the different rules, or to give them anything more valuable than a power of manipulating figures in accordance with certain directions. For young children who are learning the first four rules, perhaps it would be useless to try to do this; but I am sure that boys should know something more of the principle of proportion than is shown in the old rule—"Put the single denomination in the third place, &c.;" and that a knowledge of compound practice which enables them to work sums of one kind only by a method they do not understand is worthless.

Grammar and geography.

27. English grammar is taught in all classes except the lowest; some of the scholars could repeat the definitions of grammatical terms given in the text-book, and the more advanced were able to parse a sentence in their book of reading lessons; but the greater number could not do more than assign the proper parts of speech to words taken at random from the book. Geography is learned by all the classes except the lowest. The proficiency in this subject was generally very creditable. The children repeated the explanations of geographical terms very much in the words of their text-books, but they could generally give examples which showed that they understood what they had learned.

Without looking at the map they could mention the names and describe the positions of the countries in Europe, and their capitals; they could generally mention the divisions into provinces, the counties and chief towns of Ireland, and occasionally possessed a similar acquaintance with the chief geographical facts relating to England. The quickness and intelligence shown in the answers to questions on this subject was remarkable. In the National schools I did not find any boys learning mathematics or languages, either ancient or modern. In the girls' schools both plain and fancy work is learned by most of the girls. The proficiency of the children in the convent schools and in the ordinary National schools was much the same. The best National school which I visited was quite equal to the best convent school in this respect, and there are convent schools below the general average of National schools.

Christian Brothers teach the younger children elementary subjects only.

28. The subjects taught in the Christian Brothers' schools differ slightly from those taught in the National schools; grammar and geography are not learned by the lower classes, but only reading, writing, and arithmetic. The division of these schools into classes is also nearly the same. Each class has a book of reading lessons corresponding to the book used in the class of the same rank in the National school. The books in the Christian Brothers' school, however, are rather more difficult; the lowest class is expected to be able to read, and their book is intermediate between the First and Second Books in the National schools. The passages selected are many of them of a religious nature, and would probably be considered unsuitable for use in a school attended by children of various creeds. Writing is taught in the same way as in the National schools, with much the same result; the handwriting is excellent, the spelling indifferent. In the highest class the boys are taught to write original composition. At the school which I examined this exercise took the form of a letter, and I have specimens which were written for me on the spot without previous notice, and under my inspection. These would do credit to boys of the same age who had received the best education.

Books used.

Arithmetic as in the National schools; mental arithmetic much practised.

29. Arithmetic is taught in the same way as in the National schools, and I could not discover that the boys had any better hold of the principles than the boys in the National schools. Mental arithmetic was taught with great success in the school which I visited. The boys in the highest class were arranged in two lines facing each other and challenges were exchanged from side to side: the rapidity with which the answers were given was such that I could keep up with the boys with great difficulty, although I had the advantage of a pencil and paper. Whether the accomplishment is worth the labour and time which must have been spent in acquiring it is doubtful. Geography and grammar are, as I have said, taught in the higher part of the school only. Although the boys had been learning these subjects for a shorter time than the boys in the corresponding classes in the National school their knowledge was not at all inferior; but the class which I examined was the highest in the school. The History of England and Ireland is taught, and the boys exhibited the amount of knowledge that might be expected after a study of any school manual of English History. The eagerness with which some of my questions were answered showed that certain parts of the history of their country excited the boys' interest keenly. Mensuration, Euclid, and algebra are taught when there are boys who have made sufficient progress to allow them to begin these subjects. In one school some of the boys were learning Latin, in order to qualify themselves for admission to the College at Maynooth.

Higher subjects.

Parochial schools.

30. The subjects taught in the parochial and other Protestant schools unaided by the State are of course in the main identical with those taught in the National schools. The chief points in which the two classes of schools differ are these—in the parochial schools writing from dictation is not practised so universally as in the National schools, and the history of England is learnt. Many of the parochial schools are in connexion with the Church Education Society, which issues a programme of instruction and recommends the books to be used. The books are altogether inferior to those published by the National board and the supply was very scanty in most schools. The books of reading lessons were these—the Dublin Spelling Book, which takes the place of the First Book published by the National Board, a book of reading lessons, published by the Society for Promoting Christian Knowledge, adapted to the third standard under the English Revised Code, and a History of England published by the same Society. The two latter books were apparently used indiscriminately by all the children who could read. The books were not in all cases the property of the children and frequently appeared to have been but little used. In some schools I received a strong impression that reading was not practised by using these books, but that the daily reading of Scripture was considered to be sufficient. There is a rule of the Church Education Society that Scripture is not to be used except for the purpose of religious instruction, but that rule can hardly be supposed to exclude the practise of the art of reading. Arithmetic is, on the whole, less efficiently taught in these schools than in any others; but indeed the same remark may be extended to secular instruction in general. There is an entire want of system in most of these schools. The programme of the Church Education Society may be professedly adopted as a guide, but its regulations are not universally obeyed. The principle on which the children were divided into classes I frequently failed to discover. In each class of one school I have found children, of whom scarcely two reached a similar degree of proficiency in the three subjects, reading, writing, and arithmetic. More frequently the reading and writing of a class was fairly equal throughout, but in arithmetic all was confusion—some scholars able to work sums in the rule of three, others unable to work examples of the simple rules.

Scanty supply of books, and these inferior.

Great importance attached to religious instruction.

31. The extreme importance attached to religious instruction in these schools probably explains the inferiority of the scholars in secular knowledge and their apparently anomalous classification. One hour daily out of the six, during which the children are supposed to attend, is given to the reading of Scripture, and, besides this, portions of Scripture are learnt by heart by all the children. Those whose parents do not object are taught the Church Catechism. An hour and a half daily will therefore be a moderate estimate of the time devoted to religious instruction.

32. At almost every parochial school, which I visited, disappointment was expressed at my refusal to examine the children in religious knowledge. I can understand the reason, because I had the advantage of attending the examination of a parochial school held by the Inspector of the Church Education Society. The fluency with which the children repeated the portion of Scripture that had been learnt by heart, and their intelligent answers on other portions of Scripture, were very

remarkable, and must have been the result of very considerable care and attention. This school, however, was much above the average of parochial schools in most respects.

Endowed schools.

33. The schools under the Board of Erasmus Smith are very similar to the parochial schools, and, except in Dublin, they take the place of parochial schools, and are under the control of the Incumbent of the parish.

34. The Dublin school can no longer be called a primary school, the boys learn Latin, Greek, mathematics, and modern languages. The master has raised the school to its present condition; when he was appointed the school was attended by children of the same class as the scholars in the parochial schools, and had no extraordinary reputation, but he raised the character of the instruction with such success that the school is now crowded with boys whose object is to get an education that will enable them to pass the Civil Service Examinations, or to enter Trinity College.

35. The other endowed schools, not parochial schools, which I visited, were not distinguishable from the parochial schools in respect of the subjects taught. I saw three of these schools, Ralph Macklin's, and Knight's Endowed schools in Dublin, and the Blue school at Drogheda. The last is a charity school in which twelve boys are fed, clothed, and educated. The master of the charity school is also master of the parochial school, and the charity boys attend the parochial school. Ralph Macklin's school is more pretentious than a parochial school, the boys in the highest class were learning Latin, French, Euclid, and Algebra; two or three possessed a smattering of Latin, some more were able with the master's assistance to conjugate the verb *parler*, but their knowledge of French was limited to the earlier portions of the grammar which they used. Of Euclid and algebra they knew nothing. I afterwards examined in the less ambitious subjects of arithmetic and writing from dictation—the results were most unsatisfactory. Knight's Endowed school is a charity school which supplies the place of a parochial school in the precinct of the Cathedral of St. Patrick; the number of boys admitted is twenty, and the education is similar to that given in parochial schools.

Schools supported by the Society for Promoting Irish Church Missions.

36. Besides these schools in which secular instruction is professedly the chief object for which the schools are intended, I visited two schools supported by the Irish Church Missions Society. One, a boys' school, was called a ragged school, though the boys were much better clothed than the generality of those who attend the National schools, but I was told that their clothes was the reward of their regular attendance. The religious instruction was the predominant feature of the education given in the school, the secular instruction being considered quite subordinate. A school for girls belonging to the same society was similar in its aim. Here the girls were boarded and lodged as well as clothed. In both schools the course of instruction was the same for children of all religions; indeed, I was told that "controversy" was taught in order to instruct those who were not yet Protestants, and to strengthen the principles of those who were.

Want of system in the parochial schools as compared with the National schools.

37. The universal adoption of the same system of education in the national schools renders it possible to make a general description of the education given in them tolerably fair. The parochial school in which the common feature is the compulsory religious instruction, cannot be so well included in one account. Some parochial schools were systematically conducted and the scholars in them as proficient in secular knowledge as the scholars in the national schools; but on the other hand, there were parochial schools which were in every point much inferior to any national school, and this inferiority seemed to me to be mainly due to the irregular way in which the school was conducted. It is this want of system and method which makes a general account of them so difficult and unsatisfactory.

National teachers all of tried efficiency.

38. By the regulations of the National Board all teachers of national schools must be either "classed," or "probationers." A classed teacher has passed an official examination, on the result of which, and on his proved efficiency as a teacher his class depends. A probationer has not been examined, but in order to be retained in a school must appear at the examination, should a summons be sent. Of eighty-nine principal teachers of schools which I visited four only were probationers. Two had been just appointed to schools, and expected to be summoned to the examination; the other two were teachers of schools which had been in operation for some years before they were placed under the superintendence of the National Board. The original teachers had been retained in their places, without being compelled to pass the official examination. There are three classes of teachers, and three divisions in each class. The examination of a teacher for classification generally precedes, or immediately follows the first appointment to a national school, but a teacher who wishes to improve his class may be again admitted to the examination, if the Inspector makes a favourable report of the state of his school, and a teacher may be depressed if the Inspector considers that his school is not properly conducted. This being the extent to which the efficiency of the teacher affects his classification, the examination is clearly the more important influence. A comparison of the state of schools under teachers of various classes was the only available means of estimating the value of the classification as an indication of the efficiency of teachers. The test is not very accurate since many local circumstances beyond the teacher's control may assist or hinder his efforts. However, the schools which appeared to be especially well managed, and in which the scholars had made the greatest progress, were under the care of teachers who had obtained a high class, and the inferior schools were generally conducted by teachers with a low class.

Many of them have been trained in Dublin.

39. Most of the schoolmasters and a large proportion of the mistresses had passed through a course of training at the normal school in Dublin. The masters of twenty-four out of twenty-seven schools which I visited in Dublin, and the mistresses of twenty-five out of thirty-five schools had been trained. The masters of thirteen out of seventeen National schools in the country, and the mistresses of three out of ten schools had been trained. The untrained teachers were generally much younger than the rest, and only recently appointed to their schools. With four exceptions, all National teachers had been educated in National schools, and had been monitors and assistant teachers before their appointment as principal teachers. Thus any teacher, trained or untrained, must have become thoroughly acquainted with the nature of his work before he is appointed to take charge of a school. I could not observe that the untrained teachers were at all inferior to trained teachers of the same grade, and in similar situations. The larger proportion of untrained teachers is composed of females who had in many cases been monitresses in one of the large convent schools in Dublin.

40. The teachers of schools attended by boys only were men in all cases except one. The exception was the lower school for boys in the St. Patrick's National Schools in Dublin, in which all the teachers were women. Judging from the excellence of this school I should think that in all similar schools female teachers would be preferable. All girls' schools and infant schools were under female teachers. In the country where there are schools attended both by boys and girls, the teacher is sometimes male and sometimes female. These schools are generally so small that there is no assistant teacher, but in one of them the master's wife acted and was paid as an assistant teacher. The popular feeling, I was told, was in favour of male teachers in mixed schools, but the managers of schools said that they preferred a female. Female teachers appeared to maintain order in these schools, and to teach the children quite as well as male teachers. In most schools there are monitors, and in the larger schools assistant teachers. The monitors did not attempt to teach the higher classes, but the assistant teachers were not confined to any particular part of the school. I did not observe any case of neglect of the lower classes by the teachers. In Dublin, where most of the larger schools are situated such neglect is rendered impossible by dividing the schools into two independent parts, each of which is considered as a separate school. The upper school contains the higher classes, the fourth, third, and part of the second, in most cases; the lower school the rest of the children who are too old to remain in the infant school. The teachers of the schools were, as a rule, quite independent; though in one school which I visited the two departments were nominally under the control of the head of the higher school. I have noticed jealousy between the teachers of such schools; in one instance the teacher in the higher school complained to me that the children were not sent up as soon as they were ready for promotion. Where the school-fees are paid to the teachers there is doubtless a temptation to detain children as long as possible in the lower school. In the case I have mentioned, however, that temptation did not exist, because the manager received the school-fees, and paid the teachers a fixed stipend.

The sex of teachers and scholars generally the same.

In mixed schools a female teacher preferred by school managers.

Younger children not neglected.

41. The appointment and dismissal of teachers is in the power of the managers of schools, but the Commissioners reserve the right of withdrawing their contribution towards the salary of any teacher whom they consider incompetent, and of absolutely dismissing the teachers of vested schools. Both teachers and managers were satisfied with this arrangement as far as I could ascertain; at least no complaint was ever made to me on the subject. No case of dismissal had occurred recently in any school which I visited. The relations between managers and teachers, as a rule, appear to be very friendly. At the worst, the manager never troubled himself about the school, and left the teacher to do what he could for himself. When, as is generally the case, no residence for the teacher is attached to the school, I found that the teachers did not wish for it, but would prefer an increase of salary; it was stated to me as a reason, that if the teachers lived close to the school or church, the manager might have an opportunity of compelling them to undertake additional labour. The teachers had, with very few exceptions, adopted and pursued their calling from the time that they were scholars in National schools, and they have no other occupation now. One National school teacher kept a newspaper shop; and I heard that another gave private lessons out of school-hours. In a country school, the master told me that he wanted to go away immediately after the ordinary time of closing the school, in order to survey a field for a farmer in the neighbourhood. In another school there was a residence, with three acres of ground rent-free for the use of the master; the ground he cultivated. These were the only instances which came to my knowledge of teachers having any employment which had no connexion with the school. The teachers of many schools hold evening schools in winter, for which they receive £5 from the National Board, in addition to their class salary, and in a Dublin school the master was paid by the parish priest for teaching a Sunday-school. I was surprised to find that so few of the teachers endeavoured to obtain employment for the hours during which they were not engaged in the school, for, by nearly all, the amount of salary they received was declared to be insufficient. The salary is derived from three sources—the National Board, school-fees, and the manager or local subscriptions.

Appointment of teachers.

Teachers have no employment except in their schools.

42. The Commissioners, in their regulations, state that, before a National school can be established, satisfactory assurance must be made to them that some provision will be made from local sources to increase the teacher's salary in addition to the school-fees, thus clearly enunciating the opinion that the amount of salary derived from their payment, and the school-fees, is not sufficient remuneration. In the Dublin schools, the managers generally make some addition to the teachers' salaries, and the principal teachers receive considerably more than the masters of country schools, who have in general nothing except the salary paid by the National Board and the school-fees. The average income of the masters of schools in Dublin, which I visited, is not less than £60 per annum. Some of them receive considerably more; the highest master's salary was £102 (with a residence), the lowest £33, without a residence. In country schools, the average salary of a master is not more than £40; but there are many schools which are under a mistress, who receives very much less. The schoolmistresses' salaries in Dublin are much lower than the masters'. The average salary is about £35—in the country, about £25. The salaries of assistant teachers are much smaller. Residences are very seldom provided for the teachers, and therefore all their expenses must be covered by their salaries.

Salaries only the amount of the stipend paid by the National Board and the school-fees.

43. The remarkable difference in the salaries paid in Dublin and in the country schools is due to two causes. The teachers in Dublin are generally of a higher grade than those in the country, and therefore receive a larger stipend from the National Board; the amount derived from school-fees, and from other local sources, is also much larger. Of course the expense of living in Dublin is greater than in the country, but the difference is not nearly equal to the excess of the average Dublin salary above the average country salary.

44. The teachers, almost without exception, complained of the insufficiency of their salaries. They are unable, if married, to save anything, and yet the only support which they can expect in old age or bad health, must be the provision they make for themselves. The teachers of schools where the amount of the school-fees was small, and no assistance was given by the manager, told me that their income was barely sufficient to supply their own wants. The teachers of country schools are in still worse circumstances, and the result is, that in the mixed schools female

Teachers dissatisfied.

teachers are gradually taking the place of male teachers. In the country also, there is great difficulty in obtaining monitors, and in keeping monitors who have been appointed and are in receipt of salary from the National Board. Promising boys prefer to adopt any other occupation that offers itself. I was told of one or two monitors who had given up their posts in order to become railway porters. The difficulty in getting properly qualified boys to become monitors is not so much felt in Dublin, because many boys are glad to take the opportunity of continuing their education, and at the same time earning a little money. They hope to qualify themselves for situations, which could only be obtained by persons who had received a fair education, and they have no intention of adopting teaching as the means of gaining their livelihood. I noticed that some of the teachers were physically incapable of any hard work, either on account of ill health or deformity; and a person whose experience renders his opinion very valuable, told me that it was a fact that the teacher's life was thought to be a resource for those who were unable to get their living by manual labour. I think that there can be no doubt that the teachers have good reason for their complaint; and that their salaries are too low. It may be useful to compare their salaries with those of the parochial teachers, and of another body of men who may be considered to occupy a similar station—the constables.

Unwillingness to become teachers.

Comparison between the salaries of National teachers and of parochial teachers.

45. The parochial teachers have as a rule rather larger salaries than the National teachers, a residence rent-free, and in addition they hold the office of parish clerk. From this office they cannot be removed without compensation, and thus they have some small provision for old age. Besides, the private liberality which provides their salaries, would probably continue to help them when they were obliged to retire from active work. The constables of the lowest rank are paid from £36 to £44 per annum, according to the length of their service, they live in the barrack, their uniform is provided for them, and they have the prospect of a pension on retiring from service. Thus the parochial teachers and the constables are in better circumstances than the National teachers, both with regard to their present income and expectation of pension. The constable's pension was very frequently mentioned to me by the National teachers as the great object of their wishes. The most injurious effect of the lowness of the salaries, and the want of pension, is the tendency of teachers to continue at their posts, when from age and health they are unable to do their duty as vigorously as is desirable. Then the children suffer, unless the manager either with or without the recommendation of the Inspector discharges the teacher. It is not difficult to understand that most managers would think such a measure too harsh, unless they could see that some provision would be made for the retiring teacher. It is true that the National Board is willing to grant a sum of money to teachers who retire after a certain period of service, but the amount is not sufficient to maintain them for more than one or two years, and does not succeed in inducing superannuated teachers to give up their posts. The female teachers who receive a much smaller salary than the masters, were more desirous of an increase of their income than of a pension. They were as a body much younger than the masters, and probably looked forward to marriage as the close of their work in schools. The difference in the amount of salary paid to schoolmistresses in National and parochial schools is not very great; but in the parochial schools the mistress was frequently the wife of the schoolmaster, and her salary was considered as an addition to his, and therefore in reality the parochial teacher was much better paid than the National teacher.

Pension the chief desideratum of National teachers.

Efficiency of National and parochial teachers contrasted.

46. The work done by the National teachers, estimated by the number of children they teach, is of course much greater than that the parochial teachers have to do. Of the efficiency of the two classes of teachers it is hardly fair to judge from results only. The National teachers have many advantages—the systematic course of instruction prescribed by the Commissioners, the rules for the conduct of the school business, and frequent inspection, combine to render the teacher's work in a measure mechanical, and this effect is increased by the thorough knowledge of the system which the teachers have acquired as scholars, monitors, or assistant teachers. Inferior teachers may go through their work in a perfunctory manner, but the system directs their efforts so that the scholars receive more benefit than they could from the capricious zeal of more energetic persons, who were allowed to adopt any method of teaching that seemed good to them. The parochial teachers may conduct their schools as they please, subject only to the interference of the parish clergyman. They have had no training for their work, except such as may be given in the central school in Kildare-street, and whatever this may be, it is no substitute for the long and thorough preparation received by the national teachers. The consequence is that their school business is conducted in the most unmethodical way—the classification of the children, the time-table, the manner in which the school rolls are kept, even the arrangement of the rooms—in all these points the parochial schools contrast very unfavourably with the National schools. But after making allowance for defective machinery, it appeared to me that the parochial teachers as a body are not equal to the National teachers; yet in Dublin schools their salaries are not less, and in the country considerably higher than the salaries of the national teachers, and in addition they have in nearly all cases a residence provided for them. Their work is not so heavy because the number of children in the parochial schools is much smaller than the number in the National schools. The schoolmaster is very commonly the parish clerk, and derives a small increase to his salary from his office. This arrangement has been supposed to interfere with the power of the clergyman to dismiss a teacher at pleasure, because the clerk's office cannot be taken away from the holder. Practically no difficulty is found to occur, because the stipend of the parish clerk is not sufficient to support a man who has nothing else to depend upon. Assistant teachers and monitors are unknown in parochial schools. The number of scholars in any school that I saw was not large enough to require another teacher, but a properly qualified monitor would have been very useful in many of the schools. It seemed as if the disorder and confusion that exists in some of these schools was caused by the attempt of the master to teach all the scholars at the same time. This inconvenience might be avoided by the employment of a monitor, who would thus receive an early training in the work of teaching, of the greatest value to him if he intended to make that his occupation in life. The expense was occasionally mentioned as a difficulty which prevented the appointment of monitors, but in most of these schools this method of assisting the teacher had never been thought of. At present there are very few schools in which a boy could be found of any use for such a purpose. In Dublin, and occasionally in the country, the parochial teachers are assisted

by the frequent visits of the clergy and other persons, principally ladies, who interest themselves in the education of the poor. This sort of encouragement is scarcely ever given to the National teachers —an indication among many others, that all local interest and care is devoted to denominational education.

Class of children in attendance at primary schools.

47. The class of children in attendance at primary schools, the regularity of their attendance, the period during which they remain under instruction, and the proficiency they attain, vary considerably in different places and in different kinds of schools. The poorest children, it is scarcely necessary to state, are the least regular and the most ignorant. The schools frequented by them are the ordinary national schools, even where, as in Dublin, convent schools or schools of the Christian Brothers are also in operation. The children who form the great majority of the scholars in parochial schools are, as a rule, far removed from destitution and want; in the poorest districts of Dublin the difference between them and the national scholars was very evident. In these places the effect on the national schools of the poverty which prevails among the adjacent population was strongly forced upon my notice. The children looked half starved, and were clothed in rags which seemed scarcely to hold together. They were exceedingly irregular in their attendance, being often absent for many days in succession; sometimes because an opportunity of earning a few pence had been offered them, sometimes because their parents would not send them without decent clothing and without food, but more frequently because no one cared whether they went to school or not. In some of the parochial schools food and clothing are given to the children who come regularly to school, and in consequence the schools are better attended. The amount of relief given is, however, but small, and the true reason for the better attendance of the children is to be sought in the greater care which their parents take for their children's education. When the children who attend the National schools are not so exclusively of the poorest class the attendance is more regular, though there is still room for improvement when population is so numerous that it is impossible to urge individuals to do their duty in this matter, and amongst the people considerable indifference prevails.

National schools frequented by the very poor, who are very irregular in their attendance.

Period of attendance short, and amount of knowledge gained very small in poor districts,

48. In the very poor districts most children cease to attend national schools altogether after they have reached the age of eleven years; in parochial schools generally, and in national schools which are more favourably situated, the period of attendance is prolonged until the scholars reach thirteen or even fourteen years. The degree of proficiency attained by the children in the worst schools is very low. Most of them leave school before they have passed through the second class; they cannot read a sentence of ordinary difficulty; they may be able to write their own name legibly, and in very favourable cases to copy a few words from a book; at the best they have learnt the four simple rules of arithmetic, but are more commonly ignorant of anything beyond multiplication. It is not difficult to imagine how soon they relapse into a state of perfect ignorance. Whether a greater amount of knowledge might not have been expected from children of their age is a question to which the extreme irregularity of their attendance during that period when they were supposed to be under instruction, gives an answer. In parochial schools and national schools elsewhere most of the scholars reach the third class, and some even the fourth, before they leave school altogether. They can read a newspaper with difficulty, but sufficiently well to induce them to keep up their power of reading or even to improve it; they can write tolerably, and know the four simple rules, sometimes also the four compound rules and proportion. When so much knowledge has been acquired there is some hope that it may be, if not increased, at least not entirely lost during the active life of the scholars. In the country I found no schools in which the scholars were so unpromising as in the very poor Dublin schools: the attendance also, except at those seasons when there is a great demand for labour in the fields, is fairly regular. The children remain at school until the age of twelve or even thirteen years, and not unfrequently return when they are out of work, or when they have left one place and have not found another. The proportion of scholars who reach the third class is considerably larger than in the poor town schools, but is not so large as in the best. On the whole, however, the state of education is more satisfactory in the country than in Dublin. There are several causes which tend to produce this state of things; the population of each district is much smaller, and is amenable to the influence of the clergy and teachers, which in the densely populated town districts is unavailable; the condition of the people is better, there is little or no positive destitution, and there is not much opportunity for getting work for children of tender age. At the same time the parents are not much more anxious about the progress which their children make than the inhabitants of the town, and are not so careful in sending them regularly to school as they ought to be.

elsewhere more satisfactory,

and in the country as compared with Dublin.

Suggestions for improvement.

49. In order to improve the state of education in the town several suggestions have been made. They may be classed under three heads—gratuitous instruction, rewards for regular attendance, legal compulsion. The first method has long been tried with most unsatisfactory results. In many parochial schools no fees are ever asked for, and the attendance is not at all more regular than in other schools in which the scholars are drawn from the same class. In the national schools the payment of fees is never required as a condition of admission, and I was assured wherever I went that the free children were the most irregular in every way. The common tendency to value cheaply that which costs nothing is productive of great mischief in this respect, though the other causes which I have already mentioned, the poverty of the parents, and the use they make of their children's labour are quite as effectual. No doubt instruction must be given gratuitously to a large class of children, but there is danger of the privilege being greatly abused. As a means of attracting the poor to school it cannot be very effective, as far as past experience justifies an opinion on the subject. Rewards, or rather bribes for attendance, have also been tried, though not very generally, and with very undesirable results. The so-called ragged schools are intended for children whose poverty forbids their attendance elsewhere. To those who attend regularly clothes and food are given, and in consequence the appearance of the scholars is not such as might be expected from the name of the schools. The effect of these schools is said to be very pernicious in some respects, they tempt parents to neglect their duties to their children because other persons will undertake them, and it cannot be concealed that they are used as organs for the spread of peculiar religious opinions. I visited two schools of the kind, and in both the chief object of the schools was to train the scholars in the Protestant religion, whether their parents belonged to that creed or not. There was no deception in the matter, it was openly

Gratuitous instruction.

Rewards to the children for regular attendance.

avowed that all scholars who attended would receive religious instruction of the kind. Of course a general application of this principle is impossible, and it is not difficult to understand that much mischief is caused by its adoption to its present limited extent. At the same time the fact cannot be evaded that there is a great number of children outside the workhouses, whose destitution renders school attendance impossible. In many of the parochial schools a slice of bread is given daily to all the younger children, some of them are clothed; and the ladies who visit some of these schools relieve any urgent case of necessity. No objection can be made to such a proceeding. The most pressing case is not, however, reached by this means. Most of the destitute children are Roman Catholics, and attend national schools if they go to school at all. It has been suggested that if the managers of such schools had the means at their disposal, they might be able to render the regular attendance of many children possible who are now frequently absent from these causes. The Government grant or the school fees could not be applied to such a purpose, but it would not be difficult to induce charitable persons to give their assistance to a scheme of the sort. It would still, of course, be necessary to avoid carefully any injudicious distribution of relief to undeserving persons, and any attempt to bribe the parents to send their children to school. Neither of the plans hitherto mentioned would produce any effect on the large class of parents in better circumstances who are not careful in sending their children to school. The only means stronger than the appeals of the clergy or the teachers that anyone mentioned to me was legal compulsion. It is unnecessary to enter upon the arguments for and against this method; it is sufficient to state that the feeling against is less strong than it may be supposed to be. I would especially refer to some remarks of the Rev. Dr. Spratt on this subject, which will be found in the Appendix, and which, I believe, may be taken as representative of the opinions of many of the Roman Catholic clergy, who are the chief promoters of popular education in Dublin.

Legal compulsion.

Religion of scholars.

50. With regard to the religion of the children in the different kinds of schools, the general result is this:—in the national schools, both in town and country, the scholars are chiefly Roman Catholics; in the parochial schools Protestants; and in the Christian Brothers' schools Roman Catholics. In Dublin, wherever there is a national school a parochial school is always to be found at no great distance; the national schools are generally under the management of the Roman Catholic clergy, and no Protestant children are to be found in them. In the parochial schools, especially the infant schools, a few Roman Catholic children attend. It is impossible to give an exact estimate of the number, because in these schools no distinction is made between the children of different religions. In some schools I was told that the children of mixed marriages were considered to be Protestants, in others Roman Catholics; but, including all such doubtful cases, I think the number of Roman Catholic children to be found in parochial schools is very small. In national schools under Protestant managers there are very few or no Roman Catholics, except in the case of one school of which the circumstances are peculiar, and in which nearly all the scholars are Roman Catholics. In the country the parochial schools are very nearly as numerous as the national schools and succeed in attracting nearly all the Protestant children. I found very few parishes without a school, and in these the whole number of Protestants is exceedingly small, and quite insufficient to make it worth while to keep up a school for them. In such places I found a few Protestant children in the National school. In another place where the parochial school was considerably below the average of such schools, and the national school was exceedingly good, two or three Presbyterian children attended the National schools. In general the children of different religions will not mix in schools. It cannot be expected that the Roman Catholic clergy should cease to hinder as much as they can the attendance of Roman Catholic children in parochial schools, where it is openly professed as the principle on which the schools are conducted, that all children are to receive instruction in Scripture from Protestant teachers. However, in the National schools, the protection afforded to the religion of the children does not succeed in attracting Protestants to schools under Roman Catholic managers or Roman Catholics to schools under Protestant managers. No one complained to me of any violation of the rule of the National Board, though I endeavoured to make every possible inquiry on this point. Even the parochial clergy, who were most opposed to the system, did not complain that its rules were broken.

Practically no mixed education.

51. On both sides the clergy seem to have sufficient influence with the parents to prevent the attendance of children at schools of which they disapprove, and on that account their opinions are especially valuable. Some of the Protestant clergy profess themselves supporters of mixed education, understanding by the term common instruction of all children both in religious and secular knowledge, and think it reasonable to complain that the Roman Catholic children are restrained from attending their schools. Others, who have the management of national schools, told me that mixed education was most desirable; but I did not find one of them who would approve of a Protestant child attending a Roman Catholic national school, if there were no other national school within reach. Another significant indication of their real feelings is the establishment of national schools by the clergy of various Protestant persuasions, because they think it better that the children of parents who profess a particular form of Protestantism should not be sent to a school where the manager and teacher profess another. In fact, the conclusion to which I came was this, that the professed supporters of mixed education desired to establish schools which they should manage and which children of other denominations should attend, but were by no means willing to send children of their own creed to schools conducted by persons of a different creed. I need only repeat that no one ever hinted at any effort on the part of the Roman Catholic clergy to discourage the attendance of Protestant children, or, on the other hand, to interfere with their religion in the national schools. The danger that Protestant children were said to incur was the injury their faith would receive if they learned to imitate the practices of Roman Catholic children by associating with them—an objection which cuts at the root of the principle of mixed education. The opinion of the Roman Catholic clergy is well known. On the whole, my impression is, that the dislike of mixed education, in any real sense of the term, is universal among persons who now control the education of the poor.

Protestant clergy nominally in favour of mixed education, but in reality opposed to it.

Popular feeling.

52. What the opinion of the parents themselves is it is impossible to say; as a fact, they follow the wishes of their clergy, and have done so for such a length of time as to make it probable that as far as they have any feeling in the matter they agree with their clergy. The Protestant children, or at least the children of members of the Established Church, are sent to the

parochial schools, even where there are national schools of great excellence under Protestant, but not Episcopalian management, within reach. On the other side the Roman Catholics prefer the Christian Brothers' schools, where they have the choice between these and the National schools. The Christian Brothers have a reputation for giving a better education than can be obtained in the National schools; and, certainly, the higher classes in their schools are remarkably well taught. But with the younger children their system is not at all more successful than the national system. These facts seem to indicate a preference for denominational education on the part of the persons who are most directly concerned.

School buildings,

53. The school buildings, in general, whether belonging to National schools or to private schools, are not at all what they ought to be. The rooms are badly constructed and without any provision for ventilation, the windows too small or too few and badly placed, and the situation of the town schools is frequently most unsuitable. The parochial and other private schools are superior to the national schools in this respect. On some buildings belonging to these schools which have been lately erected money had been freely spent, and the result would have been excellent if the builder had considered that light and air were necessary in a school-room. Those school-rooms belonging to the Christian Brothers, which had been built by them, were very good in all respects, and form the most remarkable exception to the general character of school-rooms.

in the case of Dublin National schools very bad.

54. The national schools, with the exception of those vested in the Commissioners or trustees have been built, and are kept in repair by means of local contributions. Two-thirds of the expenses of the erection of vested schools is contributed by the Commissioners, and the whole expense of maintaining in proper repair schools vested in them. The vested schools are very few in comparison with the non-vested. The buildings of those which I saw were, on the whole, superior to the buildings of non-vested schools, and the schools vested in the Commissioners were in much better repair than others. The Dublin schools are decidedly worse than the country schools, and thoroughly deserve the condemnation passed on the schools in his district by the Inspector of National schools in South Dublin. Apparently the only test of a building's fitness for its purpose that is required is that its area should be sufficient to allow eight square feet, at least, for every child in attendance. It is stated in the Regulations that the Commissioners will withdraw their aid from schools which are not kept in proper repair, *i.e.* will take away the teacher's salary, in order to make local managers or trustees do their duty. No instance of such a measure being adopted had ever occurred, though several school-houses were so bad that it is impossible to understand why the Commissioners sanction their use. The school Inspector is the only person whose duty it is to report on the state of the buildings, except in the case of schools vested in the Commissioners, and these are visited from time to time by the officer of the Board of Works, who orders all necessary repairs to be executed. There were only three schools vested in the Commissioners within the district assigned to me. I saw them all; they were in good repair, having been inspected by the officer of the Board of Works within the year.

Apparently no means of compelling proper provision in non-vested schools.

Inferiority of school buildings due to the failure of local efforts.

55. The state of most of the non-vested schools, or schools vested in trustees, was such as to prove that local contributions cannot be depended upon, either for the construction or maintenance of proper buildings. There are some managers of schools who do provide good school buildings, so that it is clearly possible to obtain the necessary funds from local sources, but whilst the extraction of subscriptions from (possibly) unwilling contributors is left to the tact or goodwill of the local manager, it is probable that the present unsatisfactory state of things will continue. Wherever I went, I always endeavoured to find out what local support was given to schools, and I sent a circular to school-managers, asking for an account of the money received for the support of their schools. I found that whilst the parochial and other private schools are almost entirely supported by local subscriptions, the national schools generally have no local support except from the children's pence. In some of the Dublin schools the parish priest has a charity sermon for the school, and the few national schools under Protestant management both in Dublin and in the country have considerable support from endowments and subscriptions. In the country I found only six national schools, for which there was any local contribution. At Maynooth, the Duke of Leinster subscribes £20 annually to the national school. At Celbridge, Mr. Langdale, who was the manager of the school, subscribes to the school. The Countess of Mayo gives the master of the national school at Kill £3 every winter for a night school, and pays all the expenses incurred for light, fuel, books, &c. Lord Powerscourt gave the school-house and the teacher's residence at Enniskerry, besides a large addition to the teacher's salary. Lord Fitzwilliam gives £6 annually towards the salary of the national school at Rathdrum; and the Mining Company of Ireland almost entirely supports the school at Glendalough. A small national school at Halverstown, in the county of Kildare, was held in a house which had been given to the school by Mrs. Purcell, who lives there. Mrs. Purcell was the local patron, and made a considerable addition to the teacher's salary, besides providing him with a residence close to the school. These solitary instances of liberality on the part of a few persons of rank and influence are no substitute for the general local support which is required, in order to provide and maintain proper buildings for non-vested schools. There are persons who are willing to assist in providing the means of education for the poor, but they prefer to support denominational schools, such as the parochial schools.

Instances of private munificence.

56. Whilst some of the supporters of parochial schools are conscientious opponents of the national system, it seemed to me that others had no strong bias in favour of or against the national system, and would subscribe to the national school just as willingly as to the parochial, if they were asked to do so. It might have been expected that Roman Catholic landed proprietors would have supported the national schools just as the Protestants support the parochial schools, but I was told that as a rule they do not take the slightest interest in the matter. An idea seemed to exist almost universally, that it was the duty of the Government to undertake the whole expense of the schools, and indeed not of elementary schools only; persons who could afford to send their children to boarding schools, complained because the State had not established schools in their neighbourhood, at which their children could be educated in a manner suited to their rank in life, as cheaply as the poorer children in the National schools. It was never alleged as a reason for not supporting the National school that the priest was the manager; but in two only out of the few cases which I have mentioned of schools

The management of schools by the clergy

not alleged as a reason for refusing to support the schools.

in the country receiving any local assistance, was the management of the school in the hands of the priest. The general feeling on the subject of National education seemed to be either indifference, or the actual hostility of the supporters of other systems. Indeed the zeal of school managers even seem to be exhausted when schools have been once established.

57. In Dublin there is more attempt to obtain support for the schools. Many local patrons have a charity sermon for their schools which produce from £70 to £100, and some collect subscriptions in addition.

No accounts of any expenditure on fabric, &c.

58. In the appendix to the Report of the Commissioners of National Education a table is drawn up showing the amount raised locally in aid of the teachers' salaries. From a comparison of these sums with returns which were made to me from most of the schools which I visited, I found that the sums mentioned in the tables generally represented the school-fees and the additions made to salaries by the managers. No account seems to be kept of the money (if any) which is expended on the school buildings, or which is collected to support them. In the country schools, as I have said, such an account is unnecessary; but in two or three of the Dublin schools considerable sums must have been quite lately spent in providing new buildings; I was unable to obtain any estimate of the amount. The maintenance of old school buildings in Dublin is another expense of which I can give no authentic estimate; from the state of the buildings, however, I am sure that the sum must be very small. For most of the parochial schools, which depend on local subscriptions entirely, annual reports of the receipts and expenditure are published. From these it would be possible to calculate the average expense of educating a child; and could the same data be obtained for the National schools an instructive comparison might be made. But the only returns of the expenditure on the National school is the amount granted by the State in aid of the teachers' salaries, and the sums raised in the locality for the same purpose. An estimate of the comparative expense of the two systems can be made if no account is taken of the sums spent, the repairs of buildings, or any other purpose, except the payment of the teachers. Such an estimate will be found in the appendices to my report.

PART II.—DETAILS OF INQUIRY.

Section I.—Drogheda.

Order in which the districts were visited.

59. I now proceed to give a detailed account of my inspection of schools in the different districts, taking the districts in the order in which I visited them. I began with Drogheda. I then went to Naas and Celbridge, and completed my examination of those districts before the end of July, just as all the schools were closing for vacation. It is important that the time of my visit should be noticed, because I was given to understand that the attendance in the schools was below the average in consequence of the approach of the vacation and the demand for labour in the fields at that season. Towards the end of July, the schools in Dublin re-opened after the summer vacation, and I was engaged in visiting them until the beginning of September, when I went to the Wicklow district, to which I had made one visit previously. Here I found two schools closed for the vacation, but the schools were generally in full operation, and no excuses were made for the want of a larger attendance, or for the state of the schools. At many of the schools in Dublin, I was told that the children had forgotten so much during the vacation, that they would give a very unfair impression of the efficiency of the school—an excuse which, whatever may be its value, I think right to state here.

Drogheda.

60. Drogheda is a very busy seaport, with considerable trade, and contains several manufactories—one of which is a cotton-mill belonging to Mr. Whitworth. At all of these—but especially at the last—I was told that large numbers of boys and girls were employed. The town is divided into unequal portions by the river Boyne, the northern portion being considerably the larger. The two parts of the town are very distinct; and I was told the children who lived in one part of the town seldom went to school in the other.

Population.

61. The population of the town of Drogheda in 1861 amounted to 14,740 persons, of whom 1,031 were members of the Established Church, 13,342 were Roman Catholics, and 367 Presbyterians, or members of some other Protestant religious body. If, therefore, the whole number of children of school-going age be divided into three portions in the ratio of the numbers—10, 133, and 4—the result may be taken as a fair approximation to the numbers of children of each religious persuasion who ought to be at school.

Period of school age. Method of calculating the number of children of various religions who ought to be in attendance at school.

62. The school age may be supposed to extend, in towns at least where there are infant schools, from three to thirteen years. The children between three and five years should be assigned to infant schools; those above five and under thirteen to ordinary schools. I did find children less than three years old, and more than thirteen, in the schools, but the exceptions are few; indeed, twelve years might be taken as the higher limit of school age with nearly as much reason as thirteen years.

63. The census tables give the number of persons whose ages fall within the limits of successive periods of five years. The numbers corresponding to the periods from five to ten years, and from ten to fifteen years are nearly equal. The number of any particular year may therefore be supposed nearly equal to one-fifth of the whole number corresponding to the period. Thus the number of children between the ages of five and fifteen years is found to be the sum of the number given in the tables for the period from five to ten years, and of three-fifths of the number corresponding to the period from ten to fifteen years. For children under the age of five years a variation in the method of calculation is necessary, as the number of children under the age of one year is disproportionately large. This number is given in the tables, as well as the number between the ages of two and five years; half the latter I take as an approximation to the number of children who might attend infant schools. In this way I have calculated the number of children of both sexes who were of school age in 1861, and assuming that the proportions of the children belonging to each of the three principal religious bodies are the same as those of the general population, I have obtained an approximate representation of the numbers of children arranged according to their religion. These results are exhibited in the following tables. The numbers refer to the whole town of Drogheda; if it is wished to discover the members which belong to the northern or southern division of the town, that is, to the parishes of St. Peter or St. Mary, it can be done without difficulty, as the population of the latter is one-third of the population of the former, and therefore one-fourth of the whole.

TABLE A.—Showing the Estimated Number of Children of School Age in Drogheda.

TABLE A.—Estimated number of children of school-age in Drogheda.

—	Above 3 years and under 5.	Above 5 years and under 10.	Above 10 years and under 13.	Total above 5 years and under 13.	Total above 3 years and under 13.
Males, . .	336	799	449	1,248	1,584
Females, . .	316	789	445	1,234	1,550
Total, .	–	–	–	2,482	3,134
Members of the Established Church, . .				168	213
Roman Catholics, ...				2,249	2,836
Presbyterians, &c., ...				65	85

64. According to the census returns 1,836 children—of whom 154 were Protestants, and 1,682 Roman Catholics—were in attendance at primary schools on May 17, 1861; 205—of whom 129 were Roman Catholics, and 76 Protestants—at superior schools. Assuming that these figures indicate the proportions in which the children can be divided into classes which attend superior schools or primary schools, and the numbers of the two religions in each class, I conclude that one-ninth of the children should be in attendance at superior schools, eight-ninths at primary schools, and that two-fifths of the number who ought to be in attendance at superior schools are Protestants, but only one eleventh of those in attendance at primary schools. The number assigned to superior schools is probably excessive, because the proportion of non-attendants in the class of children who go to superior schools is much smaller than the proportion in the lower class. If, therefore, eight-ninths of the whole number of children be taken as the number who ought to be in attendance at primary schools, and for whom provision should be made, the estimate will be too low rather than too high. The number of Protestants in the lower class will be very nearly one-third of the whole number of Protestants, the number of Roman Catholics nine-tenths of the whole number of Roman Catholics.

Proportion in attendance at primary and superior schools respectively.

65. The following table shows the number of each religion actually present at every kind of primary school on June 25, 1868, and the number of children who should have been in attendance, calculated in the manner described:—

TABLE B.—Showing the Number of Children actually present in Primary Schools in Drogheda, on 25th June, 1868.

TABLE B.—Number actually present in primary schools in Drogheda, on 25th June, 1868.

66. This table has been compiled from the returns of the school attendance made by the Constabulary. The most remarkable result is the very large proportion of Protestant scholars, especially of boys, the number in this instance being actually in excess of the estimated population. Several circumstances afford a partial explanation of this apparent paradox. At the Protestant National school many of the children came from the neighbourhood, and formed no part of the population of the town. Twenty-three of these boys were Presbyterians, but according to the census of 1861, only eight Presbyterians were in attendance at primary schools; and therefore the increase in the attendance may be partly due to a change in the character of the population. The National school in question was not in existence in 1861, and the fact of its establishment adds to the probability of this explanation. There is also another cause for an increased attendance of Protestants at primary schools. In 1861, fifty boys were returned as present at the Drogheda grammar school, which has since fallen into decay, and at the time of my visit could not be said to be in operation. Some of the boys, I was told, had come to the Protestant national school because there was no better place of education within reach.

Possible error in the return made by the Constabulary.

Large proportion of Protestant scholars.

67. At all events it is clear that the national school is sufficient to afford instruction to all the Protestant boys living in the town who ought to attend primary schools. There is no female national school except the convent schools, but a few girls attend the Protestant school with the boys. With the Roman Catholic population the case is quite different. There is a fair proportion of the estimated number of children actually present at school; but the State provides schools for a very small part of the whole number of boys, and for a part only—though a much larger part—of the girls. It is remarkable also that the female National schools are convent schools, and that the great majority of the boys attend the Christian Brothers' schools, which hold a similar position in popular estimation to the convent schools.

Extent to which the State provides the means of education.

68. A feature peculiar to Drogheda is the large number of private schools, or as they were termed in

Hedge schools.

the list of schools sent to me, hedge schools; judging from the only school of the kind which I saw, I should think that parents who cared at all about the education of their children would not send them to such schools as these, if any other of the same class as a National school were available. These private schools according to the report of the constabulary were attended by Roman Catholics only, and therefore depend for their support on the class of children who might be expected to attend the national schools if they could. The parents, therefore, must either have some prejudice against the national and the Christian Brothers' schools, or must be unable to obtain admission for their children to these schools.

School accommodation provided in the southern part of Drogheda

69. Only one of these private schools had a large number of boys in attendance, and this school was situated in the smaller portion of the town, on the south side of the Boyne. The only other schools in the same part of the town were a convent school, under the National Board, and a National school for boys. The convent school was a very superior building to the national school, and was attended by a much larger number of children, of whom two-thirds were infants of both sexes, the rest girls, though the number of girls was less than the number of boys in the national school; still as no girls attend any school in this part of the town except the convent school, it is plain that the parents are quite satisfied with the existing school, and do not wish for any further provision to be made for the education of their female children. The employment of girls in the factories, and at their own homes when their parents are at work all day, causes the number of girls at school to be smaller than the number of boys. On the day on which the number of children at all the schools was counted, 124 boys were present in the national school and twenty-three in the private school which I have mentioned. The average number in attendance at the national school is 157, and slightly in excess of the number for which accommodation is provided. As there is no other school except the private school in this part of Drogheda, the parents of those children who do not attend the national school have no choice except to send them to the schools in the northern part of the town, at some distance from their homes, or to this private school. In either case they would receive no benefit from the aid given to education by the State, and it may be safely concluded that additional accommodation ought to be provided in the national school. The number of children of school age, excluding infants, living in the district, and who may be expected to attend primary schools, is about 250, and the number for whom there is accommodation in the National school is 140, so that an addition to the existing school is needed rather than the establishment of another.

for girls,

for boys.

Some increase desirable.

The circumstances of northern district very similar.

70. On the northern side of the Boyne, where the larger part of the town is situated, almost all Roman Catholic boys who go to school attend either the infant school at the convent, which is under the National Board, or the Christian Brothers' schools. The girls attend this convent school, or two other convents, which maintain schools not dependent on the National Board. There are three small private schools in this part of the town, one of which I visited. At the school there were six boys, apparently about six or seven years of age, and six girls who seemed to be rather older. The children were of exactly the same class as those who attend the national schools; the boys were learning to read in preparation for the Christian Brothers' school; the girls, the person who kept the school told me she could educate entirely, but she expected that before long they would go to the nuns. She said that her school used to be much more flourishing, before the establishment of the convent schools had ruined it; and she could now collect a few children only whom she taught to read. Even in this she had to suffer from severe competition; a few days before, a disabled cobbler had begun to keep a school, and some of her children had been taken away by their parents who wished to give the cobbler some help in his troubles. Why any parents could choose to send their children to such a place as this when schools like the convent schools were available, I cannot imagine. The room apparently served the mistress for every purpose; the heat and the atmosphere were intolerable; and the mistress possessed no extraordinary power of giving instruction, which might attract children to her school. There is a reason which accounts for the presence of the boys in this and similar schools situated in this part of Drogheda. The only boys' school is conducted by the Christian Brothers, who expect the children to be able to read a little when they first come to school. The greater number of the children have learnt so much in the infant school attached to the convents, but boys too old for the infant school and perfectly ignorant have no resource except such schools as that which I have described. This reason cannot be adduced in order to explain the existence of the private school on the south side of the Boyne, because in that part of the town there is a national school at which children would be received, however ignorant they might be. The want of a national school in the northern part of the town, which the existence of private schools seems to indicate, is so much felt that, as I was told by one of the Roman Catholic clergy, they were considering a scheme for the establishment of such a school.

Wretched private school.

St. Peter's National convent school.

71. Of the girls' schools in this part of the town, I was only able to visit one besides this wretched private school—the national convent school. There are two other convent schools—one maintained by nuns of the Dominican order, which was closed for vacation when I wished to see it, the other, an evening school for the girls who work in the mills. At the national convent school, 269 girls were present on the day of my visit. The number on the day of the constable's visit was 309. I did not count the children in the infant school; but the number returned by the constable was 193. The infant school is held in one large room—the girls' schools in two smaller rooms. One of the rooms contained 129 children in the first and second classes; the other room contained 140 children, of whom 12 were in the fourth class, 51 in the third class, and the rest in the second class and a class intermediate between the second and third. The rooms were exceedingly good—large, lofty, and in perfect order. They were deficient in one point only—there was no ventilation except by the windows. These were all open, and the rooms were not at all crowded, so that the want of ventilation was not perceptible; but in the winter, or in weather which does not permit the windows to be opened, the rooms cannot be healthy.

Number of scholars in attendance.

School-buildings.

72. The unsatisfactory construction of school-rooms like these, when there has been no want of funds, and the promoters of the school have had the best intentions, show how necessary it is that the erection of school buildings should not be left to local effort alone. The central authority should at

any rate give sufficient aid to acquire the right of insisting that the plans should receive its approval previously to their final adoption, and thus prevent errors in the construction, which are due to the want of knowledge on the part of the builder of the requirements of a school-room.

Proficiency of scholars.

73. I examined the children in reading, writing, and arithmetic. The reading was remarkably good throughout the school; the girls in the third class wrote fairly from dictation on their slates, but their spelling was not good; the girls in the fourth class wrote from dictation on paper, and were remarkably correct in their spelling. The arithmetical work of all the girls was inferior. Twenty-seven out of forty-six girls in the lower division of the second class failed in working a sum of simple addition; in the higher division of the same class, thirty-five out of seventy were unable to work sums in the first three rules. In the third class, none of the girls tried sums beyond compound multiplication, and nearly half of them failed in the sums I gave them. In the fourth class the result was rather more satisfactory; eight out of twelve girls succeeded in working correctly sums in proportion. The numbers in the different classes were these:—in the fourth class 12 girls, in the third 51, in the second and the Sequel 117, and in the first class 70. Forty-eight girls were more than eleven years old, 15 more than twelve, and 6 more than thirteen. The children were generally sent up from the infant school when they were more than six years old; but only twenty girls in the school said that they were less than seven years old, though a much larger number was said to be under eight years. The period between the ages of seven and twelve appears to be that during which the girls attend school, and the majority reach the third class before they leave school. I was told, however, by the nuns that the recent increase in the manufactures carried on at Drogheda had caused a demand for the children's labour, and that the number who remained at school after they were eleven years old was decreasing. All the children were Roman Catholics, and no application is ever made for the admission of a Protestant child.

74. The time-table by which the day's work was regulated, showed that only one interval was devoted to religious instruction, and though the rooms were decorated much more than is usual in the ordinary national schools, there was nothing to be seen that could be considered to be a religious emblem; in fact, the rules of the National Board appeared to be most carefully observed, yet they fail in their object of attracting children of all religions to the same school. In 1866 the average daily attendance at this school was 418, and the amount contributed by the State to the support of the school was £199 13*s.* 9*d.* or very nearly 9*s.* 7*d.* per head. This payment was on account of the salaries of monitresses, and therefore represents only a part of the expense of the school. It is impossible to give an account of the whole expense of such a school, because it is included in the general expenses of the convent. More than three-fifths of the whole number of Roman Catholic girls who were present at schools in this part of Drogheda on the 25th June were attending this school, the rest were in the other convent schools or the private schools. They could not have been received at this school, had they wished to be admitted, because the buildings are only sufficient to accommodate the children at present in attendance.

Expense of conducting the school.

Christian Brothers' school.

75. The boys in the same district attend the schools of the Christian Brothers. The number of Roman Catholic boys at school was 505, and 492 were present in the Christian Brothers' schools. There are two sets of schools, both conducted by the same community. The larger school is situated close to the house in which the Brothers live, and was built by them; the other is at a considerable distance, and is held in buildings that were formerly occupied, I believe, by a National school. At the larger school 294 boys were in attendance on the 25th June; on the day of my visit not quite so many. The school building contained four rooms of exactly the same size and shape—two on the ground floor, and two over these. One of the lower rooms was given up to boys in the first and lowest class, the other to the second and part of the third class; the rest of the third class and the fourth occupied one of the higher rooms, the other was occasionally used as a class room. The rooms were large enough to allow room at the desks for 100 boys if they were closely packed. I examined the boys in two of the rooms, in both of which it appeared to me that there could be very little vacant space, yet the numbers were only eighty-three in one room and ninety in the other.

Excellent building.

76. The arrangement of the rooms, the furniture, and above all the ventilation, were remarkably good. At one end of each room there was a large statue of St. Mary, but that was the only distinctive emblem, which would not have been allowed to remain in a National school. One brother presided in every room, and unassisted maintained order and gave instruction. It may be thought that for such a number of boys, a much larger staff of teachers would have been necessary; but results did not justify such anticipations. The quietness and order of the schools were most extraordinary, no one spoke above a whisper, at a sign from the teacher the boys took their places in class, or at the desks, without the least disturbance or confusion; yet attention to details of this sort had not interfered with the real efficiency of the school, for the success of the brothers in teaching was nearly as great as in maintaining order among their pupils. The boys in the highest class were well acquainted with all the rules of arithmetic, though in this subject their proficiency was least satisfactory, because they were unable to do more than apply mechanically the rules they had learnt. Their writing was excellent, and spelling very fairly correct. They were practised in original composition, and with considerable success, to judge from the specimens done under my inspection. Some of these were exceedingly good and would contrast favourably with the productions of much more ambitious schools. They knew the main facts of the history of England and Ireland, and answered every question on this subject, and on geography, with wonderful vivacity and intelligence. This class of boys was far superior to any other that I saw in the whole course of my inspection; they were, however, much older than the boys who generally attend primary schools; several of them were more than fifteen years of age, and one more than sixteen.

Proficiency of scholars in the highest class;

77. It would not be fair to estimate the goodness of a school by the proficiency of a class of boys like these, whose parents could afford to let them continue their education for so long a time. The real usefulness of the school is to be judged by the amount of instruction that has been given to the great mass of children, whose attendance at school ceases soon after they reach

in the lower classes not so satisfactory.

the age of twelve, if not before. The boys of this class read remarkably well, and wrote well; but their spelling was not satisfactory, and their knowledge of arithmetic still less so. At the same time their proficiency is wonderful when the smallness of the teaching staff is considered. The boys did not fall below the average proficiency attained by boys in the same classes in National schools, but they did not reach the standard of excellence attained in the higher department of this school. In the highest school, where the boys are much older, and more likely to be attentive, the instruction given by the single teacher may be carefully followed; but in the lower schools it must be very difficult for one person to teach a subject like arithmetic to so large a number of boys as seventy or eighty. Individual teaching is almost impossible in such a case, and is not, I believe, attempted. In other subjects the need of such teaching is not so great, and the Brothers are able to use the assistance of *quasi* monitors. On my first visit to the school, I found a number of the boys in one of the rooms arranged in small classes of five or six, and reading a lesson from their class-book to one of the boys in the class. The work proceeded with the most decorous gravity, each class obeyed the directions of its teacher as implicitly as if he had been the Brother in charge of the school, and the teacher stopped a boy reading incorrectly, or helped him in difficulties, in the most business-like manner. The same boys were not always chosen for this office, but every boy took his turn. I thought this plan appeared to answer very well as far as it was adopted. I cannot but think that the teaching in this part of the school would have been more effective if a larger regular staff was employed. I did not examine any of the boys in the lowest part of the school. I understood that all of them could read a little, as no boy in a state of perfect ignorance was admitted to the school.

Employment of monitors.

Class of children in attendance.

78. The class of boys who attend these schools is more extensive than that which fills the national schools. Many persons who belong to what may be considered the middle-class send their children to these schools on account of the excellent education that is given in them. This is a very strong testimony to the efficiency of the school, because persons of this class generally will not allow their children to be brought in contact with those whom they consider to be their inferiors; and in the Christian Brothers' schools no distinction of rank is ever made.

Practice with regard to religious instruction.

79. The Christian Brothers are supposed to present a marked contrast to the national schools with regard to the amount of religious instruction that is given. The difference is, I think, very much exaggerated. In this school—and I believe that all such schools are regulated in the same way—there are prayers at the beginning and end of the day. At certain of the hours a short prayer is said, which does not occupy more than two or three minutes. Half an hour daily is given to religious instruction; so that, with a trifling exception, the time devoted to religious instruction or observances is the same as that which is generally set apart for the same purpose in the national schools. The religious emblems I have mentioned are always exposed to view, whereas in the national schools precisely the same emblems are used during the time of religious instruction, but must be put out of sight during the rest of the day. The Christian Brothers do not shrink from making allusions to religion as occasions may arise during the progress of the secular work, but they told me that though they attributed the order which distinguished their schools even more than the proficiency of the boys to the religious and moral influence which they exercised, yet, that it was not their custom to introduce the subject of religion, except at the appointed time for religious instruction. Besides giving instruction in the school, they endeavoured to take care that the boys performed all their religious duties, and in this way, and by their own character as members of a religious community, they were able to acquire a strong influence over their pupils. They told me that one or two Protestant boys had at different times come to their school, and that others would be freely admitted if they wished to come without being required to attend during the time of religious instruction, or to join in the devotions of the rest of the school.

Second establishment of the same community.

80. I have hitherto confined my remarks to one of the two sets of schools which, as I have already said, were conducted by this community. The other schools are smaller than these, and the buildings are very inferior. The furniture and decorations of the rooms are almost exactly like those of the larger schools; and there was no difference that I could observe in the degrees of proficiency attained by the boys in these schools, and by boys of the same standing in the other. I thought that the boys belonged more exclusively to the poorer class, and certainly the proportion of boys of advanced age was much smaller.

Peculiar situation of these schools.

81. These schools are especially remarkable because, unlike most of the establishments of the community, they do not compete with the national schools for the attendance of pupils, but are the only schools available for the Roman Catholic population of the district in which they are situated. It is true that in the same part of Drogheda there is a national school, but it is far too small to accommodate one-tenth part of the number of boys attending the Christian schools, even if they were willing to attend a school of which the manager and teachers were Protestants. The Christian Brothers' school may, therefore, be fairly compared with a National school in a similar situation, undisturbed by competition, and giving education to all the boys in the district who go to school. I saw many national schools in such circumstances, and of all degrees of efficiency, and I think that, on the whole, they are decidedly inferior to this Christian Brothers' school. At some national schools the children, especially the younger children, are taught quite as efficiently as the children here; but the order and quietness with which this school was conducted, the wonderful command the brothers seemed to exercise over the boys, and the excellence of the school buildings and arrangements, are quite unapproached by any national or other school that I have seen.

Comparison with National schools.

Schools established and maintained by private liberality, but not by local effort exclusively.

82. It is difficult to give an estimate of the expense of this school, and if it were possible no comparison could fairly be made with the cost of other schools. In these the teachers give their lives to the work, which is with them a devotion, and not a means of earning a livelihood. The education is entirely gratuitous; but the parents—or those at least who are not very poor—generally contribute towards the expenses of the school. A great deal of support is obtained, however, from the liberality of persons who have no local interest whatever in the schools. The director told me that the new convent which he had just finished had been erected from funds which he had collected from all over

the world; that many Protestants in England had subscribed to the building. The local subscriptions are insufficient to meet the annual expenses of the school, but the deficiency has hitherto been always made up from other sources.

Other schools for Roman Catholics in the southern district.

83. In the part of Drogheda situated on the southern bank of the Boyne, there are three schools, all attended by Roman Catholics exclusively. One of these is a private school; the others are the National school for boys and the Convent school, also under the National Board, both situated in St. Mary's parish.

St. Mary's national school.

84. St. Mary's National school is held in a building that had been originally the residence of the parish priest. On his removal to another house this had been altered, in order to make it suitable for its present purpose. The Commissioners of National Education had contributed towards the expense of the alterations, and had received a bond, by the terms of which the building was appropriated to the purpose of National Education. The school-room occupied the upper part of the house and part of another; it was very long and very low, without any attempt at ventilation, and very deficient in air and light. The state of repair was by no means satisfactory, and the situation of the building, hemmed in on all sides by wretched houses, was very bad. The number for which accommodation was provided was 140. The manager, who is the parish priest, said that he should like to build a new school, but could not raise the necessary funds in the neighbourhood. Apparently nothing is collected or given for the maintenance of the school, which depends entirely on the aid given by the State and the payments of the children. The number present on the day of my visit was 102, of whom forty-two were in the first class, thirty-four in the second, and twenty-six in the third and higher classes. Fourteen boys were above twelve years of age, of whom one was above sixteen years, and two others above fifteen; thirteen boys were less than seven years old, of whom three were less than six years old. The ages at which the greater number of boys first come to school and leave school were, I was told, seven years and twelve years; and most of the boys reach the third class before they leave school finally. My information with regard to the ages I obtained from the boys themselves; but I do not think it very trustworthy, because only a few of them were able to say in what month their birthday was. This uncertainty about their age was universal among school children, and therefore, all statements which are made on this point must not be considered very accurate. One or two of the boys in this school were very much older than the rest; but they had not been at school continuously, and their proficiency was by no means as great as might have been expected from boys of their age.

Unsatisfactory state of the buildings.

Number and age of scholars.

Proficiency of scholars.

85. I examined the whole school in reading, writing, and arithmetic. Thirty-eight out of forty-two children in the first class could read words of one syllable from their lesson book, thirty of them could copy words or letters in the same book on their slates, and all, except four, could do a very easy sum of simple addition. The experience I gained from the examination of this class taught me that it was not worth while to examine such small children, and afterwards I never examined any class below the second. In the second class were thirty-five boys, most of whom were between the ages of eight and ten years, though three of them were above eleven and two others above ten years. Only twenty of them could read a lesson from their class-book with ease. Eight absolutely stopped at every word of two syllables, and seven others could not read such words without making mistakes. I read to them a very easy line from the lesson book, which they all wrote on their slates. The result was not in every case an exact copy of the sentence I gave, but it was always composed of letters, so that all the children had some notion of writing. Four of them who wrote the sentence correctly, worked a sum in simple division; fifteen others managed to get through a sum of simple multiplication without assistance. In the third class were twenty-one boys, all of whom could read fairly and write well, but their spelling was bad. Half of them were unable to work sums beyond simple long division; the rest knew the four rules, simple and compound, fairly, and could do easy sums in proportion without understanding the process in the least. The highest class was the fourth, containing boys, of whom three were more than fifteen years old. They all read well, but could not write correctly from dictation; they could work examples of any rule in arithmetic up to simple interest, but were quite unable to make anything of a question which required some original thought. Besides the boys in this room, there were twelve younger children in a room on the ground floor, under the care of a monitor, who were learning to read, and knew little beyond their letters.

Infant school.

Teacher's salary.

86. The average attendance at the school, according to the report book, was 157; on the day of my visit the number was 114, including the infants, and the number returned by the Constabulary was 124. The master had two assistants and one monitor. He was in the first division of the second class, and received £32 annually from the National Board, and the school-fees, which amounted last year to £22. No residence was provided for the teacher, and he paid on this account £16 10*s.* for rent and taxes; but this expense is probably rather large because he kept a newspaper shop. Until last year he had added to his income by conducting an evening school in the winter, at which the pupils were prepared for the examinations of the Science and Art Department, but the school had been given up in consequence of the falling-off of the attendance.

Expense of conducting the school.

87. In 1866 the Commissioners contributed £94 11*s.* 8*d.* towards the salaries of the teachers, and the amount raised from school-fees, which were the only local support, was £30. The average attendance during the year was 132. Thus the cost of the school, excluding repairs to the building and furniture, amount to 18*s.* 11*d.* per head, towards which the average contribution of each child was 4*s.* 6*d.*, or as nearly as possible 1*d.* per week. A few of the children paid more than 1*d.* per week, and some were free, as the payment was not required from children whose parents were very poor. The school is at present unfit to accommodate the number of scholars in attendance. The dimensions of the room, 60 feet by 14 feet, show that the number ought not to exceed 140, and with this number the lowness of the room, and the absence of ventilation, would cause the atmosphere to be almost intolerable. It cannot be doubted, therefore, that the school accommodation is insufficient, since, as has already been shown, this school is the only provision, except a small private school, for 250 boys, who ought to be under instruction.

Great alterations necessary.

St. Mary's convent school.

88. St. Mary's convent school is conducted by Sisters of Mercy, and like all schools of the kind, possesses excellent buildings, which are kept in good repair, and in perfect order. On the day of my visit the school could hardly be said to be in operation; in the girls' school only 38 girls were present, the average attendance being 100. The rest were absent, because the races which were being held in the neighbourhood proved too strong an attraction. None of the children present were below the second class, 12 were in the third class, and 4 in the fourth. In reading and writing the proficiency of the children was up to the average; in arithmetic they were backward; the girls in the fourth class knew nothing beyond the four rules, simple and compound; but it is hardly fair to judge of the school from so small a selection. In the infant school there were 62 children; this was much below the usual number. The numbers returned by the constabulary were, 94 in the girls' school, and 129 in the infant school. In 1866 the average attendance in both schools was 194, and in an evening school which was not in operation at the time of my visit, 96. The contribution of the Commissioners towards the expenses of all the schools was £130 14*s.* 2*d.*, and the amount raised by school-fees was £4 8*s.* 9*d.* The expenditure amounts to 9*s.* 4*d.* per head, but is of course only a part of the whole expense of the school. I was told by the nuns that a considerable part of the cost of the National school was met by the proceeds of a superior school which they maintained. The nuns were assisted by six paid monitresses, and had no difficulty in getting candidates for vacancies when they occurred, but the candidates in general were not all qualified for the place. The school could not accommodate a much larger number than the average attendance, which does not amount to much more than two-fifths of the whole number of girls of school age living in the district.

Schools attended by Protestants.

89. All the schools which Protestants attend are on the northern side of the Boyne; these are the national school, of which the manager is the Presbyterian minister, the parochial school, and the Blue school.

National school. Peculiar situation.

90. At my visit the national school was not in full operation; the vacation began on the next day and a public examination of the children was being held. The school-room occupies the whole space beneath the chapel; at the door of the chapel some steps on the outside of the building lead down to the door of the school-room, and thus the regulation of the Commissioners, "that there shall be no direct internal communication with any place of religious worship," is obeyed. The room is, from its situation, not so airy or light as is desirable; it is only possible to place windows at each end, as the chapel stands in a street with houses touching it on both sides. The room and furniture were in excellent order when I saw them. I listened for some time to the examination of the children, and looked over the dictation exercises and sums that they worked; their answers were very intelligent and their work was very good. There were several persons present during the examination who appeared to interest themselves in the school, and I was told by the manager that he had no difficulty in raising funds for the necessary expenses of the school. The teacher was in the first division of the second class, and received £32 from the Commissioners and £50 10*s.* from school-fees; he had no residence provided for him and incurred an annual expense of £16 for house-rent. There is a female assistant who had not as yet received anything from the National Board, because the number of children in attendance was not sufficient to entitle the school to an assistant. The number present on the 25th June was 42; 33 boys and 9 girls. Fourteen were members of the Established Church, 23 Presbyterians, and 5 members of other Protestant denominations. Many of the boys, I was told, came from a considerable distance to attend the school; some came daily by rail from Balbriggan. It may be supposed, therefore, that the children were not of the same class as the scholars in most National schools; every child paid 5*s.* a quarter for the school-fees, all of which were paid to the teachers. The expenditure on account of salaries in the year 1866 was £65 10*s.*; the sum paid by the Commissioners was £22 8*s.* 4*d.*, the school-fees in the same year amounted to £46 2*s.* 10*d.*; no account appears to have been kept of any other sums which have been spent upon the school. The average attendance during that year was 41. The expense per head, as far as can be calculated from the returns, was nearly £1 8*s.* 6*d.*, of which the sum of £1 2*s.* 6*d.* was derived from school-fees. This does not represent the whole expense of the school, because the state of the buildings showed that something must have been spent in keeping them in such excellent repair and order; whatever the expenditure on this account may be, it is provided for from local sources, as the school is not vested in the Commissioners.

Number of scholars.

High school fees.

Expense of school.

91. The school buildings could not accommodate a larger number of scholars than that which is now in attendance; but I was told by the manager that there was no probability of any increase in the attendance as all the Protestant children attended this school or the parochial school, and no Roman Catholics would be likely to come. If this is the case it must be concluded that there are no poor Protestants in Drogheda, or very few.

Different class of children in the parochial school.

92. At the parochial school, where no fees are required, and none higher than one penny per week paid, there were only eight boys besides the boarders from the Blue school. In the girls' school there were twenty-one girls, and twenty-four children in the infant school. The children were all members of the Established Church, and seemed to belong to the same class as the children who are generally found in these schools; not so ragged as the children in the National schools, but by no means equal to the children in the Protestant National school which I have just described. If their parents had been willing to send them to the National school, they would not have paid the high school-fees. I have no reason, however, for supposing that the children had been kept away from the National school by the fees. Still it is a fact that the fees usually paid in the National schools are very high, and that no poor children attend, although some are to be found in the parochial school. The girls' and infants' schools are held in a house near the parish church; the rooms are quite large enough for the purpose, and tolerably airy and light. As usual in these schools, the furniture is not good, the desks are insufficient for the number of children, and badly arranged.

Parochal school.

Girls' school.

93. I examined all the girls except those in the lowest class in reading, writing, and arithmetic, and the result was unusually satisfactory. The four girls in the highest class wrote from dictation on paper, two of them without making any mistakes, and the other two fairly. Their arithmetic was not so good, two of them knew the four rules, simple and compound, and a little of proportion; but the

other two failed in long division. In the lower class, the girls could read and write fairly, but their spelling was bad, and they were very backward in arithmetic. The ages of the girls in the classes examined varied between seven and thirteen years; in the infant school the children remained till they could read, but very few of them were more than six years old. The teachers of both schools had residences and fuel provided for them; the teacher of the girls' school received £30 per annum, the teacher of the infant school £25.

Boys' school.

94. The boys' parochial school and the Blue school are united and placed in a new building erected expressly for the purpose. It was very good in every respect, in an open situation, with a proper supply of school furniture. The eight boys who belonged to the parochial school were very inferior to the boys from the Blue school, of whom there are eleven. The highest class contained 7 boys from the Blue school, and 2 from the parochial. The boys, with one exception, from the Blue school wrote from dictation correctly, and they were all successful in working the sums in arithmetic which I gave them. The boys in the parochial school did not write well, and their spelling was bad. In arithmetic they were more nearly equal to the others. All the rest of the boys in the parochial school were in the lowest class; and though only two of them were less than ten years of age, yet no more than four could read fairly, and all wrote badly. There was an intermediate class, which was composed of boys from the Blue school only. They wrote well, and were able to spell with tolerable correctness; but were not able to work sums in the first four rules of arithmetic, simple and compound, without assistance. The youngest boys in the parochial school were nine years old, the eldest thirteen, and there were two of this age. The master of the Blue school receives £10 per annum for teaching the boys in the parochial school. This arrangement was made two years ago, when the former master of the parochial school gave up his post. The sum raised in 1866 from all sources for the support of the three schools—boys, girls, and infants—is £58 8*s.* 4*d.*, of which £26 13*s.* was derived from private subscriptions, £20 from a charity sermon, and £10 10*s.* from an endowment. Taking the average attendance in all three schools at 60, the expense per head appears to be not quite 19*s.* 6*d.*; but it should be observed that the funds raised are insufficient to provide for the salaries of the teachers, which amount to £65. How this difficulty is surmounted I did not discover.

Expense of conducting the school.

Blue school.

95. The Blue school is a foundation for the maintenance and education of poor Protestant children, principally supported by annual subscriptions and a grant from the town corporation. The number of boys at present in the school is 11, but 12 is the largest number which the funds will support. A full account of the school will be found in the Report of the Endowed Schools Commission. At that time the state of the school was most unsatisfactory, but it is now much improved. The boys have been removed to another house, which has a large piece of open ground attached to it, and with plenty of room for the number at present in the school. The arrangements of the house are, however, still capable of great improvement. The master and matron receive £60 salary, and everything is provided for them free of expense. The master has, in addition to this, £10 annually for teaching the boys in the parochial school, as I have already mentioned. The whole expense of the school in 1866 was £221 16*s.* 4*d.*, of which the sum of £120 5*s.* 8*d.* was due to the clothing and maintenance of the boys. Rather more than half the sum was raised by annual subscriptions; the rest was derived from the corporation grant and interest on stock invested for the benefit of the school. The school is managed by a board of trustees, of which the parochial clergy of St. Peter's and St. Mary's parishes are *ex officio* members, and the institution is essentially Protestant, and is not intended for the benefit of the population generally.

96. In describing these schools I have entered into details more than I have judged to be necessary in the accounts which follow. A reference to what has been said here will, however, enable the reader to expand for himself the abbreviated remarks which will be found with less trouble than the labour of reading a continual repetition of slightly varying phrases would cause. These schools may also be taken as standards by which the efficiency of others can be measured; the Christian Brothers' school was superior to most schools which I saw; St. Mary's National school attained, or perhaps slightly exceeded, the average efficiency, and the parochial school was a fair representative of schools of that kind.

PART II.

Section II.—Districts of Naas and Leixlip.

Districts selected in the county of Kildare.

97. The districts in the county of Kildare which I was directed to examine extend in a direction nearly north and south from Maynooth to the borders of the county Wicklow at Ballymore-Eustace, and from Celbridge in the east to the neighbourhood of Kildare. The county appears to be in the most prosperous state; the cottages have an appearance of decency and comfort which indicates the absence of poverty and distress, and there are many resident proprietors. It might be expected that schools would be numerous and well supported; they are certainly frequent enough, but the local support given to them is, as will appear in the following pages, very small. In every Roman Catholic parish which I entered there is at least one National school, and the distance from one school to another seldom exceeds four miles. I was almost universally assured that the number of schools was quite sufficient for the wants of the population, and no great complaints were made of any difficulty in procuring the attendance of children, except at certain seasons when their labour was required in the fields. It may be assumed, therefore, that no great increase in the number of children attending school is at all likely to be made, and this being the case the present buildings, &c., are sufficient for the wants of the people. The condition and suitability of the buildings will be mentioned in the description I give of the schools which I visited.

Sufficiently provided with school.

98. Besides the National schools there are many parishes in which there is a parochial school, not always needed, because of the small size of the National school or of its distance; for it is not unusual that these schools should be quite close to each other, and that the whole number of scholars in both might find room in one of them, or at least in the National school.

99. In the district of Naas I visited the town of Naas and the country in the neighbourhood as far

as the borders of the county of Wicklow on the south, the village of Kill, which is about three miles to the east, and the neighbourhood of the Curragh on the west. In the Leixlip district I visited Celbridge, Leixlip, and Maynooth, in which nearly all the schools were situated. At my visits to these places I found that all the schools were on the point of closing for the summer holidays.

Naas population and number of scholars.

100. The population of Naas town in 1861 was 2,966 persons; of the whole parish, including a part of the hamlet of Sallins, 4,383, or if the rest of Sallins which is situated in another parish be included, the population is 4,667. Of these, 384 or one in twelve nearly are Protestants, the rest Roman Catholics. The following table, C, shows the estimated numbers of children of school-age in the parish, both Protestant and Roman Catholic; and the table, D, shows the number actually present at school on June 25. The numbers in C have been calculated in a manner similar to that which has been already described, (par. 63), with this exception—the number of children of school-age includes all classes of children, those who attend superior schools as well as others.

* On the day of my visit (July 13) 129 girls and 74 infants were present in this school.
† On the same day 18 boys and 21 girls were present in this school.

Comparatively small proportion of female scholars.

101. It appears that more than half the estimated number of Protestant boys and nearly all the girls were actually in attendance at school on the day of the constable's visit; a reference to the number of scholars which I found in attendance shows a larger proportion still. Nearly all, however, avoid the national schools. The proportion of Roman Catholic boys in attendance is tolerably large, and contrasts remarkably with the proportion of girls, which is unusually small. There are several reasons to account for this apparent inferiority of attendance on the part of the girls. The attendance for the day in the convent school was considerably below the average, and though this and the Sallins national school are the only schools in the parish, yet many of the girls who live in the northern part of it go to the convent school at Clane, which is more conveniently situated for them than the Naas school, and enjoys a higher reputation than the Sallins national school. The number of scholars represented in the table is, therefore, below the actual number, and the estimated number of school-age should, I believe, be reduced. The girls seldom remain at school after they reach the age of twelve years, and the tables are calculated on the supposition that they remain till they are thirteen years old. If the estimate be reduced it becomes 280, and the proportion of scholars is no longer so small.

102. I visited the national, convent, and parochial schools; the private schools I was given to understand were of a class that did not come within the scope of my inquiry.

Naas national school.

103. The national school at Naas is held in an excellent building, erected by the present parish priest without any aid from the Commissioners, as the school is not vested. The building consists of two stories; the lower story, which is occupied by one large room, is the school; the other story is kept by the manager for other purposes, and is not part of the school. A room on this floor is however occasionally used as a class-room, but only with the manager's permission, and under a distinct understanding that its occasional loan for school purposes does not cause it to be bound by the restrictions imposed by the Commissioners on the uses which may be made of National school-rooms out of school-hours. Some additional provision of this sort is necessary, as the dimensions of the school-room are such as to afford accommodation for 142 scholars only, and the average attendance is slightly in excess of that number.

School buildings.

The unusual height of the room (15 feet) causes the atmosphere to be purer than in many less crowded schools, but here the want of ventilation must be felt when the weather does not allow the windows to be opened. The desks and other furniture were sufficient, in good condition and well arranged, and as far as I could observe the boys were well provided with books, slates, &c.

Number of scholars present.

104. The number of boys on the roll on the day of my visit was 279, of whom three were Protestants; the number present was 123, considerably lower than the number returned by the constables. The cause of the decrease in the attendance I was told was the hay harvest, which gave employment to many of the children. Of the scholars present eighty-six were in the third and higher classes, and seven of these in the fifth class. This was the only instance in which I found a school with a fifth class; but the boys in this class were not distinctly superior to those in the fourth class with whom I

examined them. The proficiency of all the boys whom I examined was decidedly above the average. In the highest class the boys wrote out from memory the description of Ireland given in their text-book of geography. Of course they tried to give the words of the book as far as they could remember, and therefore the result of this work is no test of their power of composition in their own language; the spelling of most of them was fairly correct, and the handwriting of all was good. They worked examples of rules in arithmetic as far as simple interest with unusual accuracy, but, like all other scholars in this class of schools, they had no grasp of the principles of the subject. They answered my questions in geography most intelligently, and parsed a sentence which I selected from their lesson book with great success. Those boys in second and third class whom I examined fairly satisfied the requirements of the programme issued by the Commissioners. The age of the boys in the highest class was remarkable; four of them were above fourteen years, and one above fifteen years. All of them, except one, were, however, the children of parents who belonged to what may be called the lower middle class; one boy said that his father was a labourer. The general period of attendance, the schoolmaster told me, was between seven and eight years, extending from the age of five or six years to thirteen; and most of the boys reached the third class before they left school finally. Proficiency.

105. The teaching staff consisted of the master, one assistant teacher, and three paid monitors. The master was in the first division of the first class, and both he and the assistant had been trained in Dublin. The salary of the master in the year 1867 was £93 12*s.* 6*d.*, of which the Commissioners paid £65, being £52 "class salary" and £13 for good service; the rest was derived from school-fees. There was no residence, and the rent of his house was £16, but the manager bore all the expenses of keeping the school-room in repair, cleaning, &c. He was appointed to this school in 1850, but had already served under the National Board. A part of his salary, amounting at present to £13, was derived from the good-service pay given by the Board, and this he had not, of course, received until he had served for many years. He told me that his salary was sufficient for his present wants, but that he could not look forward to a time when he should be able to give up his school, because he was unable to make any provision for old age, by saving, and he had no pension to expect. Teaching staff. Salary of teacher.

106. If a teacher who receives so large a salary as this finds it impossible to save, the case of the great majority of national teachers must be very hard, for, as will be seen, a salary of this amount is unusual. It must be said also that a school so efficiently conducted is not often to be met with.

107. The national school at Sallins was a copy on a reduced scale of the school at Naas. The village of Sallins is distant about two miles from the town of Naas, and is partly in the parish. The school had been built by the parish priest of Naas, and hence its similarity to the Naas school. Here the ground floor was occupied by the boys' school-room; the upper story, which was approached by a staircase on the outside of the building, by the girls' school. The number present in the boys' school was thirty-eight, of whom seven were in the third class, and four in the fourth. I examined the third and fourth, and part of the second class. The boys in the fourth class wrote from dictation remarkably well, three of them made no mistakes in spelling, and the other made one mistake only in a piece which occupied five or six lines of their lesson book. In arithmetic they fell below the standard required by the programme; the boys in the fourth class did not go beyond rule of three, and in the third class beyond the first four rules, simple and compound; in their favour, however, it must be said that their work was singularly correct. The boys in the third class wrote fairly from dictation, though none of them escaped one error in spelling, and three out of the seven in the class made three mistakes, the handwriting was, as usual, good. These boys and the boys in the second class read with fluency, but were evidently well acquainted with the part of their lesson-book which I selected. One boy in the school was more than fourteen years old, and one more than thirteen, but no others were above twelve years, and here, as in the Naas school, I was told that the boys generally left school when they reached the age of twelve years. The children were almost, without exception, of the labouring class; the parents of the four boys in the highest class were a railway porter, a ploughman, and a railway overseer. Sallins national school.

108. The amount of school-fees for the year 1866 was £5 19*s.* 4*d.*, and the average attendance thirty-eight, thus, the payment per head was rather more than 3*s.* 1*d.*; at Naas the amount paid was £26 1*s.* 3*d.*, and the average attendance 139, and the payment per head was 3*s.* 9*d.*, but there was a larger proportion of free boys at Naas than here; so that the difference in the average amount of fees is due to the higher fees paid by those boys in the Naas school whose parents were in better circumstances. The teaching staff of this school consisted of the master and one paid monitor. The master had been appointed to the school in 1867, he was in the third division of the first class, and had been trained in Dublin. His salary in 1868 amounted to £50 11*s.* 8*d.*, of which the Commissioners paid £38, the manager £6, and the rest was derived from school-fees. The manager paid all the necessary expenses for keeping up the buildings, &c., but did not provide a residence for the master, who paid £6 10*s.* annual rent for his house. The master was of a higher class and certainly more efficient than the masters of such small schools as these generally appeared to be. The school buildings also were very good, in fact the manager had done all in his power to make his schools really useful. Amount of school fees at this school, and at the Naas school. Teacher's salary.

109. The expenditure for teachers' salaries at the Naas school in 1866 amounted to £144 9*s.* 7*d.*, or £1 0*s.* 9*d.* per head nearly, of which the sum of 3*s.* 9*d.* per head was the local contribution, and was entirely derived from school-fees. At Sallins the whole expenditure was £53 7*s.* 8*d.*, and the local contribution £11 19*s.* 4*d.*, of which the manager gave £6, and the rest was derived from school-fees. The expenditure per head was £1 8*s.* 1*d.*, and the share of the local contributions rather more than 6*s.* 3*d.* Expenses of conducting the school.

110. The arrangement of the Naas convent school was unique in my experience. The number of school-rooms was three, and in each of these rooms was a complete school, beginning with the first class and going up to the fourth. I was given to understand that this division of the school into three smaller schools, each complete in itself, was made in order to separate girls of different ranks in society. Naas convent school.

111. The largest room contained the poor children, in another room were girls whose parents were in rather better circumstances, and in the third room were girls of a higher class still. The girls of each school were as much as possible prevented from mixing with each other, because the richer Irregular arrangement of the school.

according to the social condition of the scholars.

parents would not send their children if there was any danger of their associating with the poor children. Notwithstanding this arrangement the whole establishment was considered as forming one school only, and was subsidized by the Commissioners accordingly, every child in attendance counting towards the number which regulated the amount of the grant.

School buildings.

112. The rooms were excellent, as is usual in such schools, and the furniture left nothing to be desired. No distinction could be observed in the manner in which the different rooms were fitted up, and the monitresses assisted the nuns in all the schools indiscriminately. In the highest school forty-nine girls were present—eleven in the first class, nine in the second, nineteen in the third, and ten in the fourth. In the middle school, forty-six girls were present, of whom seven were in the first class, eighteen in the second, eleven in the third, and eleven in the fourth. In the poor school there were seventy-four infants and girls in the first class, twenty-six in the second, eleven in the third, and five in the fourth.

Number and proficiency of scholars present.

Thus the proportion of children in the higher classes was smaller in the poor school than in the others, and the girls were not so proficient. In the higher and middle school, the third and fourth class girls wrote well from dictation, and were fairly correct in their spelling. In Arithmetic they failed almost universally. The fourth class girls professed to know practice and the rule of three, but two-thirds of them were unable to work sums correctly. The girls in the third book were not much more successful with the four simple rules and compound addition and subtraction. In the poor school the girls were unable to spell, and though professing that they were not so far advanced in arithmetic as the girls in the same class of the higher school, their limited knowledge was equally unsatisfactory. In all the schools the girls read well, and in the poor school great pains had been taken to teach the children singing, with excellent results. In the more useful branches of instruction it cannot be disguised that this school was inferior, and so far failed in attaining the object for which it receives aid from the State.

Expense of conducting the schools.

113. In 1866, the expenditure on this school was £122 14*s.* 1*d.*, of which sum the Commissioners contributed £97 8*s.* 4*d.*, the rest being the amount of school-fees for the year. The average attendance was 173; thus the expenditure per head was 14*s.* 2*d.* nearly, and the amount of the school-fees per head was 2*s.* 11*d.* The chief item of the expenditure was the salaries of the monitresses, of whom seven at the time of my visit were actually in receipt of salary, and one more was waiting for the Inspector's approval. It is scarcely necessary to say that all the children were Roman Catholics.

Naas parochial school.

114. The schools which have been described provide the means of education for the Roman Catholics in the town and parish of Naas. The Protestants of the same class, with the exception of the three who were on the rolls of the national school, attended the parochial school. The school buildings were small, but quite sufficient for the number of children in attendance. The boys and girls use separate school-rooms, but for my convenience when I examined the school they were collected in the same generally, without unduly crowding the room.

115. The number of boys present was eighteen, and of girls twenty-one; the youngest child was only three years old, the eldest boy fourteen, the eldest girl fifteen, and several boys and girls were more than thirteen years old. Both boys and girls, but especially the girls, seemed to have been carefully taught; the girls in the higher class wrote from dictation without making as many mistakes in spelling as usual, and without one exception succeeded in working sums correctly in those rules which they professed to know. The boys were not quite equal to the girls, but their knowledge, as far as it went, was very sound. Both boys and girls were a little backward in arithmetic, but the accuracy of their work compensated for their limited knowledge. The book from which they read was a small history of England, published by the Christian Knowledge Society. I did not discover that anything more than the most vague notions of the subject matter had been acquired. The master and mistress received £50, joint salary, and a house rent free; besides this, the master was paid £10 as parish clerk.

The school supported by endowment and local contributions.

116. The school was maintained partly by an endowment of £30, and partly by subscriptions of persons living in the neighbourhood. In the year 1866, the sum was insufficient to cover the expenses: it amounted to £39 18*s.* 11*d.* from these sources, and £5 from school-fees. The average daily attendance during the year, according to the report of the Church Education Society, with which this school is in union, was forty. The expenditure per head on account of teachers' salaries was therefore £1 5*s.* 6*d.*, without taking into account the £10 paid to the master in his capacity as parish clerk, or the value of the residence which was given to him. If this clerkship be included, and the residence be considered to be worth £5 annually (a very moderate estimate, to judge from the returns made by the national schoolmasters of the rent they pay for their houses), the total expenditure on account of teachers' salaries would be £65, and the expense per head, £1 12*s.* 6*d.* The school is under the control of the rector of the parish, who told me that he should have no objection to place the school under the National Board; but that the terms in which the legacy was made, which forms the chief support of the school, order Scriptural instruction to be given daily to every child who attends the school. The rules of the National Board with regard to religious instruction, would, if observed in the school, violate the conditions of the legacy.

Naas district.

Lady Mayo's school, Johnstown.

117. About two miles from Naas, in the parish of Johnstown, is a small school, maintained by Lady Mayo. On the day of my visit twelve children—five boys and seven girls—were present. They were all very young, the eldest being only nine years old, and very few of them could read at all, and these could only read very easy words; in fact, the school was little better than an infant school. The children, except two, were Protestants; the two Roman Catholic children were sisters, who had been attending the convent school at Naas, and had only just come to this school. The school-room was exceedingly neat and well arranged, and the children appeared to be very well looked after. The schoolmistress was a Protestant, and had been trained at the Church Education Society's school in Kildare-place.

Kill.

Population, number of scholars and schools.

118. At a distance of rather more than a mile from Johnstown is the village of Kill, in which there are two schools, a national school and an English school on the foundation of Erasmus Smith. The population of the whole parish of Kill is 792, and of the parish of Johnstown, 219. In the parish of Kill the Protestants are not quite one-tenth of the whole population; but in the parish of Johnstown

they are almost exactly one-half. In the year 1861, the number of children of school-age (omitting infants) in the two parishes was 172, of whom eighty-one were boys and 91 girls. Of the boys seventeen may be taken as the number of Protestants, and sixty-four the number of Roman Catholics. Of the girls, the corresponding numbers are eighteen and seventy-three. The number of children at school, excluding infants, at Johnstown and in the two schools at Kill was ninety-four on the day of my visit.

119. There is another National school, about three miles distant from Kill, situated in the district which is designated the parish of Lyons according to the Ordnance Survey, but which is within the boundaries of the parish of Kill according to the Roman Catholic ecclesiastical arrangements. Seventy-three children were in attendance at it on the day of the constables' visit. I was told by the parish priest of Kill that many of the children in his parish attended this school, as it was nearer than the school at Kill. He mentioned that the distance of the other school from Kill was about three miles, so that in this neighbourhood the number of schools is certainly not insufficient.

Kill parochial school.

120. The parochial school at Kill is held in a room in the house which is the master's residence. The school-room is quite large enough for the number of scholars generally in attendance, or even for the number on the roll, and is well supplied with desks and other furniture. No provision had been made for ventilation except by the windows and chimney; but the size of the room caused this defect to be less sensible.

Number and proficiency of scholars.

121. The number of scholars present was twenty-six—nineteen boys and seven girls—all of whom were Protestants, and the number on the roll was twenty-eight. The proportion of the scholars on the roll actually present, though unusually large, was not so great as it seems, because two or three children under six years of age were in the school-room, but were not entered on the rolls, because one of the rules of the Governors of Erasmus Smith's foundation forbids the admission of children on the rolls of the schools until they have reached the age of six years. The oldest pupil in the school was eighteen years of age, but he was a son of the master, and was much older than any of the rest, of whom only two were more than thirteen years old. The average period of attendance was seven or eight years between the ages of six and thirteen or fourteen. In the highest class were five boys and two girls. They all practised letter-writing, and wrote one composition for me. The spelling was correct, and the handwriting exceedingly good; the grammar not so faultless, but the productions were most creditable, considering the age of the scholars. Their knowledge of arithmetic was more satisfactory than usual. They knew the ordinary rules as far as simple interest; but they had also learnt something about vulgar fractions, and some of them seemed to understand the reason of the various processes. There was a great difference between this class and the next. In the lower class the scholars wrote very fairly from dictation on their slates, but were very backward in arithmetic, as they did not know anything of the subject beyond compound multiplication. Their work was, however, tolerably correct as far as it went. The scholars did not seem to be well supplied with books. When they read to me, copies of the Book of Reading Lessons, which appeared to be perfectly new, were given out to most of them; and I understood that no books were taken away from the school-room. All the scholars read Scripture daily, in compliance with the rule of the foundation, and no Roman Catholics ever apply for admission to the school. Twenty of the scholars are free; the rest pay £1 or £1 10*s.* annually. The teacher, who has no assistants or monitors, is paid £37 annually, and has a residence rent-free. The Board of Erasmus Smith pays £25 to the teacher, private subscriptions amount to £9, and the school-fees to £3. If the average attendance be estimated at 25, the cost of the school per head will be £1 9*s.* 7*d.*, without taking into account the value of the teacher's residence.

School fees.

Expense of conducting the school.

Kill national school.

122. The Kill national school is under the management of the parish priest, and contains separate departments for boys and girls. The school is not vested, but the Commissioners advanced money for the erection of the buildings, and received a bond, by the terms of which the buildings must be always used for the purpose of National education. The rooms were quite large enough to accommodate many more children than were present when I visited the school, and were in excellent repair, but wanted more light and ventilation. The furniture was good and sufficient, and the children appeared to be well supplied with books. In one school twenty-nine boys were present, of whom only four were above the second class. They wrote from dictation on paper, and worked sums in proportion and practice. The dictation exercise was singularly bad, but the arithmetic was good. The boys in the second class read fairly, could transcribe from their lesson book with difficulty, and could work sums in simple addition and subtraction. Three boys were above twelve years of age, and one of these was only in the second class, and by no means the best boy in the class. The schoolmaster was unassisted. He was in the second division of the second class, and had been trained in Dublin. He was appointed to the school in 1839, and has been there ever since, except during the year 1843, when he went to Dublin to be trained. His salary, in the year 1868, was £31 6*s.* 5*d.*, of which the Commissioners paid £28, and the rest was derived from school-fees. There is no residence, and the annual expense incurred on this account by the teacher is £8. Lady Mayo pays him £1 10*s.* quarterly for a night school in the winter, all the expenses of which she provides for. The Commissioners also contribute £5 to the expenses of this department of the school, and this sum makes an addition to the master's income in consequence of Lady Mayo's liberality. The night school has, however, been in operation for a year or two only, so that for nearly thirty years the master had been working at the school for a salary of £30, out of which he had to provide everything for himself and his family. With such an income any saving was impossible, and the master has no prospect for his declining years except to continue at his work in school until the manager dismisses him, in order to appoint a younger and more efficient successor, or the workhouse.

Proficiency of scholars in the boys' school.

Teacher's salary.

123. In the other school-room were twenty-nine girls, of whom five were in the third class, the rest in the first or second class. The children in the third class, of whom the eldest was not more than twelve years of age, wrote from dictation on paper very fairly, and were able to work sums in the first four rules of arithmetic, simple and compound. The children in the second class read very fairly, transcribed a sentence from their lesson book, and could work sums in simple multiplication. I was shown some plain-work done by the children in the school, which I believe was very good.

Girls' school.

The children were exceedingly neat, and very quiet and orderly. The room and furniture were kept in excellent order. The mistress appeared to be thoroughly efficient in all respects. She was in the first division of the third class, but had not been trained in Dublin. Her salary in 1868 was £18 10*s.* 4*d.*, of which the Commissioners paid £14, the sum paid to probationers; the average attendance in the school falling below the number which the Commissioners require before they pay the teacher the full class salary. There is no residence, and the teacher pays £2 12*s.* annually on this account.

Teacher's salary.

Expense of conducting the schools.

124. The expenditure for teachers' salaries in both schools in 1866 was £61 13*s.* 9*d.*, of which the local contribution was £9 8*s.* 9*d.*, derived from school-fees. The average daily attendance was sixty-two, and the cost of the school per head was 19*s.* 10*d.* nearly, and the part due to the school-fees was very nearly 3*s.*

Tipperkevin and Ballymore-Eustace.

125. About three miles to the south of Naas is the little village of Tipperkevin, which in 1861 contained 105 inhabitants, and which is situated in the parish of the same name, the population of the rest of the parish being 356. In the village is a small National school, and at a distance of two miles further south is the town of Ballymore-Eustace, where there is a National school, with three departments for boys, girls, and infants. The population of Ballymore-Eustace including the rural portion of the parish was 1,527. There are no parochial schools in these parishes, but the whole number of Protestants was only seventy-five, and the number of children of school-age probably about twelve, and quite insufficient to support a separate school.

Tipperkevin national school.

126. The school at Tipperkevin was a mixed school for boys and girls under a female teacher. The building was very unpretentious, but was fairly provided with furniture, and sufficient for the number of scholars in attendance. On the day of my visit there were thirteen boys and twenty-four girls present, of whom one was in the third class and five in the fourth. Except the scholars in the fourth class, none were above ten years of age, and most of them were under nine; but I was told by the teacher that many parents in the neighbourhood sent their children, especially boys, to the school at Ballymore-Eustace when they were old enough to be able to walk such a distance. The inefficiency of this school could not be the reason of their preference, for it was exceedingly well conducted. The children in the fourth class, whose parents were all of the labouring class, wrote as far as they could from memory, an account of Ireland given in the text-book of geography; the handwriting and spelling were excellent, the latter most unusually free from errors. They were not so successful in arithmetic, but were not much below the average proficiency in this subject. The younger children who were in the second class read fairly, and copied a sentence from their lesson books correctly; half of them succeeded in working easy sums in simple multiplication and division. The children were all Roman Catholics, and the schoolmistress also. She was in the first division of the third class, but had not been trained in Dublin. Her salary last year amounted to £24 17*s.* 11*d.*, of which the Commissioners paid £20, and the rest was derived from school-fees. She had no residence provided for her, but paid £5 4*s.* annually on this account; another deduction from her salary is the expense of cleaning the school-room, which amounts to 6*s.* annually. The sum paid for teachers' salaries in 1866 was £52 0*s.* 6*d.*; £21 by the Commissioners, the rest by school-fees. The average daily attendance was thirty, and the expense per head 16*s.* 8*d.*, the average amount of school fees per head was 2*s.* 8*d.* No scholar paid more than 1*d.* per week, and estimating the school year at forty-eight weeks, it appears that two-thirds of the children pay fees regularly.

Teacher's salary subject to certain deductions.

Ballymore-Eustace national school.

127. The school-house at Ballymore-Eustace was a large well constructed building, in every way suited to its purpose. It was vested in trustees, and had therefore been built with considerable assistance from the Commissioners. There was a large play-ground attached to the school, a most unusual feature as far as my experience goes. The boys' school was a long, airy, well lighted room, forty-six feet by twenty, well furnished, and in excellent order and repair. The number of boys present was fifty-four, of whom one was a Protestant; three more Protestants were on the rolls. The third class contained twelve boys, and the fourth class seven, three more than one-third of the whole number present had reached the higher classes. The boys in the fourth class, as far as I examined them, quite reached the standard required by the programme, but the third class was backward in arithmetic; the second class was fairly satisfactory in all respects. Three boys in the fourth class were more than fourteen years old, but most boys, I was told, leave school before they are thirteen. The teaching staff consisted of the schoolmaster and two monitors, an arrangement that was peculiarly unsatisfactory, because the monitors were constantly giving up their places in order to take some other employment. The master was in the first division of the third class, but had not been trained in Dublin. His salary last year amounted to £31 19*s.* 1*d.*, of which sum the school-fees produced £7 19*s.* 1*d.* He paid £4 rent for his house, but incurred no expense on account of the school, though the manager was the person who allowed the mistress of the school at Tipperkevin to pay for the cleaning of her school-room.

Teacher's salary.

128. The girls' school was held in a room above the boys' school, which was of the same shape, and was also remarkably well suited to its purpose. Fifty-four girls were present, one of whom was a Protestant. The girls in all the classes which I examined were equal or superior to the boys in the corresponding classes; the ages of the children, and the regularity of attendance in the two schools were much the same; but in this school the mistress had an assistant teacher and two monitresess, thus making the teaching staff exactly twice as strong, though the number of girls in attendance was less than the number of boys. The schoolmistress and the assistant teacher were sisters, and lived together in a residence attached to the school. The salary of the principal teacher in 1866 was £57 15*s.*—£24 from the National Board, the rest from school-fees—and she had the residence mentioned above rent-free. The infant school had been opened two years, and was the only school of the kind in this district, as the infant school at Naas was for girls only. There were seventy-two children in the school on the day of my visit, but the constables found thirty-seven only on the day on which they counted the attendance. The room had been added to the other school buildings when the department was opened, and was excellent in every respect.

Expense of conducting the school.

129. The expenditure for teachers' salaries in the boys' and girls' schools during the year 1866, was £100

12*s.* 7*d.*, and the contribution of the National Board was £84 3*s.* 4*d.*; the rest being derived from school-fees. The expense, and the amount of school-fees, per head were respectively 18*s.* 1*d.* and 2*s.* 11*d.*

130. There is a factory in the town which takes away the girls from school, but not until they reach the age of twelve or thirteen. However, the curate told me that many of the factory girls were in a state of great ignorance, and that he had thought of establishing an evening school, but feared that it would not succeed, because a lending-library and reading-room, which he had already in operation, were very little used. He said that there was a hamlet in the parish, but at a distance of five miles to the south, and in the county of Wicklow, where a school was needed. The population was not very large, but the distance from Ballymore-Eustace was too great, and the road which passed over the hills so bad as to prevent the children coming to school in the winter or in bad weather. This was the only case which occurred during the whole course of my examination of this district, of any complaint being made of the insufficiency of the number of schools.

Kilcullen; decadence of parochial school.

131. The rest of the schools in the district of Naas which I saw, were situate in the parish of Kilcullen, on the border of the Curragh, and nearer to the town of Kildare. In the town of Kilcullen there are two schools—a National school, which has not been established many years, and a small parochial school, which the rector told me would probably soon be discontinued. He said that before the establishment of the National school, his school had been attended by many of the Roman Catholic children, who now, of course, went elsewhere. There are only five or six children in attendance at the parochial school, and I did not think it necessary to visit the school after I had received such a report of it from the rector.

National school.

132. The National school is not vested, and the buildings, which were large and well appointed seemed rather dilapidated. The boys' school was closed for the holidays, but the girls' school was in operation, and contained fifty-one scholars on the day of my visit; all, except one, Roman Catholics. In the third class were thirteen girls, and in the fourth five, thus the usual proportion of the whole number of children had reached the higher classes. Their proficiency was, however, not so satisfactory as usual. They failed in arithmetic especially, and their writing from dictation was bad. The schoolmistress was assisted by one classed teacher and two monitresses; she had been trained in Dublin, and was in the second division of the second class; her salary in 1866 was £32 11*s.*, of which the sum of £7 11*s.* was derived from school-fees. The average attendance during that year was fifty, and the total expenditure on teachers' salaries was £70 9*s.* 10*d.*, making the average expenditure per head, £1 8*s.* 2*d.* nearly, the local contribution being 3*s.* per head. The average attendance at the boys' school in 1866 was fifty-four, but the number returned by the constables as present on June 25, 1868, was seventy-two, all Roman Catholics; the number of girls on the same day was fifty-four.

Population and number of scholars in the parish of Kilcullen.

133. The population of the parish was 2,458 in 1868, of whom 965 lived in the town of Kilcullen. Thus taking one-sixth as the proportion of persons who should be at school, the number of school age is about 400 in the whole parish, and 150 in the town. The whole number of children at school in the parish, as reported by the constables, was 183, of whom fifteen were Protestants; but I was told that many children went to schools in other parishes which were more conveniently situated, so that the proportion of children actually at school is not so small as it appears to be. The other schools in this parish are a small National school at Halverstown, rather more than two miles from Kilcullen, in the direction of Kildare, and a school on the foundation of Erasmus Smith, at Calverstown, at no great distance from the last mentioned school.

Halverstown national school.

134. The National school at Halverstown was situated on the ground attached to the residence of Mrs. Purcell, who was the patron of the school, and who built the school-house and a residence for the master. The school had formerly contained separate departments for boys and girls, but the opening of other schools in the neighbourhood had caused the numbers in attendance at this school to decrease so much as to render the division of the school unnecessary. The room was of sufficient size, and furnished with more attempt at decoration than is common in National schools. Only thirty-one children were present at my visit, of whom four were in the third, and three in the fourth class. The scholars in the fourth class were of remarkable age—one was more than fifteen, and another more than fourteen years of age; their proficiency was, as might have been expected, above the average. The rest of the school did not reach the same degree of excellence, but was on the whole in a fairly satisfactory state. The master who was in the first division of the second class, had been appointed to the school in 1834, and was rather too old for his work. There was one monitor, and Miss Purcell visited and assisted in the school daily.

Erasmus Smith's school, Calverstown; large endowment.

135. The school at Calverstown had been in operation for three months only, so that no fair estimate of its efficiency could be made. Twelve boys and seven girls were present, of whom six were Roman Catholics; yet, in this school the reading of Scripture is compulsory on all the scholars in attendance. The master had a residence provided for him, and was paid a fixed salary of £50, to which a gratuity of £5 might be added on the recommendation of the Inspector sent by the Board of Erasmus Smith. The school possessed an endowment of which the annual value at present is £80.

District of Leixlip; extent, population, and number of scholars.

136. This was the last school which I visited in the district of Naas. I then went through the district of Leixlip, of which the three principal points are Celbridge, Leixlip, and Maynooth. Leixlip is about three miles from each of the other two places, and Celbridge is four miles from Maynooth. The only schools in this part of the Leixlip district are situated in the three villages; in the western and southern extremities of the district, near Kilcock and Straffan, there are two or three small schools, which I was told were similar to those I had seen in the neighbourhood of Naas, and which I did not visit, partly for this reason and partly because I found that the schools in the district were closing, or had already closed for the holidays.

137. The population of Celbridge town in 1861 amounted to 1,382 persons, of whom 165, or nearly one-eighth, were Protestants. The parishes of Kildrought and Donaghcumper, in which the town is situated, contained at the same period a rural population of 1,005 persons, of whom 121 were Protestants, the same proportion as in the town. The village of Leixlip is entirely situated in the parish of the same name, and Maynooth in the parish of Laraghbryan. The population of the parish of Leixlip (both village and country district), was 1,412 persons, of whom 191, or not quite one-sixth, were Protestants. The corresponding numbers for Maynooth were 2,628 and 198.

138. The following tables show the estimated numbers of children of school age in the three villages and the parishes in which they are situated, and the numbers actually present at school on June 25, 1868.

Table E.—Estimated numbers of children of school age in Celbridge, Leixlip, and Maynooth.

Table E.—Estimated Number of Children of School-Age, in Celbridge, Leixlip, and Maynooth.

The proportion of scholars to the population apparently small.

139. The proportion of children in attendance at school in this district is apparently very much smaller than in any other, especially in the case of children above the age of five years. In reality I do not think the difference is so great as it seems; the children in the rural part of the district attend other schools which are nearer to them, and which are not in the district; and the town children leave school at least a year earlier than is usual in the schools I saw elsewhere. Besides this, at Celbridge and Maynooth, children were kept in the infant schools until they were seven years old, and, therefore, to meet the circumstances of this particular district, I should have estimated the school age differently in drawing up the tables; but I preferred to adopt the same system throughout my account of country schools, and to note any cases which appear to require exceptional treatment. In the case of Celbridge, if the period of attendance at the schools other than infant schools be supposed to extend from the age of seven to the age of twelve years, the estimated number of children of the proper school age must be reduced by three-eighths, and becomes 273, and the number actually at school on June 25, viz., 196, is a very fair proportion. At Maynooth a somewhat similar reduction of the estimated number of children may be made, and the proportion of this number present in the schools will be raised; and it should be remembered that this proceeding is justified by two facts, the comparative shortness of the period during which the children remain at school in these places, and the increased proportion of this time spent in the infant school. The circumstances of the two places may, I think, be the causes of these peculiarities. At Celbridge there is a great demand for the labour of children, especially of girls, in factories which are situated in or near the town; and at Maynooth the boys are very early apprenticed to the trades which supply the wants of the students in the college.

Local causes which account for this.

140. At Celbridge there are two parochial schools; a national infant school, which is not vested, and of which the parish priest is the manager; a vested school for boys and girls; and in the immediate neighbourhood is the Charter school under the management of the Incorporated Society for Promoting English Protestant Schools in Ireland.

Celbridge parochial school.

141. The parochial schools are held in the same building, one is conducted by a master and the other by a mistress; but boys and girls attend both. In the master's school twenty-three children were present, all of them Protestants; in the other school fifteen. The master was a member of the Established Church, but the mistress was a Wesleyan; the children are nearly all of them members of the Established Church. The school is conducted just like other parochial schools, and with less success than most. The school is under the control of the clergyman only, and not in connexion with the Church Education Society, or any other, and has not the advantage of any inspection whatever. Formerly when Miss Connolly lived at Castletown, she took great interest in the school, but now the master and mistress are left to do much what they please. The master was paid £18 annually by Mr. Connolly, and £7 by a local subscription, but the latter item was variable in amount; he had also a residence rent free.

Celbridge charter school.

142. At the Charter school sixty-two girls are boarded, clothed, and educated free of expense. They are elected into the school after a competitive examination in reading, writing, and religious knowledge; but all candidates must have been in attendance at a Scriptural school for a year previous to the examination. Girls are retained in the school for four years, and after leaving the school have no further claim on the Society. The school-room and all the arrangements of the house at Celbridge which I saw were excellent, and the girls in the classes which I examined had been most carefully taught, and had attained a degree of proficiency quite unequalled in any other school which I saw. They were generally the children of small tradesmen, or of persons in that rank of life, and many of them were much older than the children who attend National or parochial schools.

143. The National school is vested in the Commissioners, and the local patron at the time of my visit was Mr. Langdale, who lived close to the school, and who used to take great interest in it. The building was not very modern, and was not well constructed, but was in excellent order. The Inspector of the Board of Works had visited it in January, 1868, and ordered an outlay of £20 16*s.* The boys' and girls' school-rooms were exactly alike, each consisting of one large room and a smaller class-room, and affording accommodation for 108 scholars. Celbridge national school.

144. The number of boys present on the day of my visit was eighty-two, of whom three were Protestants. The fourth class contained twelve boys, and in one division of the third class there were eleven boys. Their writing and spelling were excellent, and the quickness and accuracy with which they worked sums of different kinds showed that they had been taught with very great care and success. I also examined some of the little boys in the second class, and their work came up to the high standard of the other part of the school.

145. The girls' school was as good as the boys', and in it the children, as far as I could discover, were taught with the same uniform success. There were seventy-eight girls present, of whom twenty-three were in the third or fourth class. Here also a few Protestant children attended the school. Six were on the roll, and four of these actually present on the day of my visit. The master and mistress were both in the first division of the first class, and evidently thoroughly efficient and energetic; but I cannot but think that the excellence of the school is partly due to the unusual interest taken in its welfare by the patron and the parish priest, the Rev. M. MacManus. The patron appointed the teachers and supplemented their salaries, and, I was told, habitually visited the school when he was residing at Celbridge. The parish priest gave all the support he could to the school by frequently visiting it, and inquiring into the progress of the children. At the beginning of each half-year he celebrated a mass, at which all the Roman Catholic children attended; at the end he assisted at an examination, and presented prizes to the successful scholars.

146. All the teachers were Roman Catholics. There was an assistant in each school and two monitors in the boys' school. The master and mistress had been trained in Dublin. Their salaries in 1868 were £82 19*s.* 5*d.* and £67 6*s.* 1*d.* respectively, and as they were married their circumstances were comparatively easy. No residence was provided for them, and the annual expense they incurred on this account was £18. The master's salary was made up of the following items:—£52 class salary, and £10 good service pay from the Commissioners, £5 from the manager, and £14 19*s.* 5*d.* from school-fees; the mistress's salary from same sources—£42, £9, £5, £11 6*s.* 1*d.* The sum spent in teachers' salaries, &c., in 1866 was £226 16*s.* 1*d.*, toward which local sources contributed £36 1*s.* 1*d.* The average daily attendance during the year was 146, and therefore the cost per head was very nearly £1 11*s.*, the local contribution per head being 5*s.*

147. The national infant school is held in another part of the village, and I did not visit it. The parish priest is the manager of it. He also maintains an evening school for girls and young women who are employed in the factory. This I visited and examined as fully as time would permit. There were 40 pupils present of all ages, from twenty-three down to ten or eleven years; but the age of the greater number was between fourteen and eighteen years. Nearly all of them had been at a day-school during some time of their lives; many of those who were younger had ceased to attend the day-school very recently. The older pupils were workers in the factory, and the younger girls came to this school because their parents kept them at home during the day. Such children, however, I was told by the parish priest, he only admitted to the school when he was satisfied that they could not attend the day school. Nothing is taught in the school except reading, writing, and a little arithmetic, and the system of the day schools is adopted. Thirteen pupils were reading the Third Book, but the rest had not advanced sufficiently to be able to read anything more difficult than the Second Book. Two-thirds of the pupils in the third class wrote correctly from dictation, and some of the pupils in the lower class copied a sentence from their lesson book; but they had still much to learn in this branch. The school is held during three nights of the week in summer, but in the winter there is a Sunday-school, attended by the same class of persons. The teachers are employed in conducting the infant school during the day, and the room is used as the infant school. The school is mainly supported by a grant of £10 from the National Board, but a small sum is derived from school-fees. Celbridge evening school.

148. At Leixlip I visited the parochial school, which is a small school, attended both by boys and girls, of whom twenty-one were present on the day of my visit. Three of them were fourteen years of age, and of these one had been only six months at school. The other two formed the highest class in the school. They read and wrote fairly, and worked sums in practice. The rest of the school was inferior; the spelling and writing were not good, and the arithmetic very weak. No school-fees are paid by the children, and the only support is derived from private subscriptions and the proceeds of a charity sermon. The amount raised in 1866 was £39 1*s.* 4*d.*, and the average daily attendance twelve; thus, the cost per head was more than £3 5*s.* The National school had closed for vacation when I visited Leixlip. Leixlip parochial school.

149. At Maynooth there are three schools: a small parochial school, a National school for boys, and a National convent school. The parochial school could hardly be said to be in operation when I saw it. The vacation was soon to commence, and only nine children were present, and of these four were infants. On the 25th June the constables found fourteen children present. The buildings are excellent, and would accommodate thirty scholars with ease. The school is not in connexion with any society, and depends on local subscription entirely for support. The sum raised in 1866 was £50, and it was expended thus: Maynooth parochial school.

Twenty-three children clothed,	24
Master's gratuity,	18
Coal and books,	9
Total,	£51

150. The master's salary is paid to him, in his character as parish clerk and organist, for discharging the duties attached to these offices. He receives £36 annually, and a residence is provided for him.

Maynooth National school.

151. The National school is non-vested, but was an excellent building in good repair and well appointed. It was given by the Duke of Leinster, and contains a residence rent free for the master. The number of boys present was forty-six, of whom only seven were in the higher classes. The children were very young; two only of them had reached the age of eleven years, and I understood that it was uncommon for a boy to remain at school after that age, the demand for labour was so great. As far as I examined the boys seemed to be fairly proficient, their handwriting, as might have been expected, was very childish and unformed, but the spelling was good, and their arithmetical work fairly correct. The boys in the second class, who form an important element in the school, since many of them never rise out of the class, could read from their lesson book with tolerable ease, write a little and knew something of the first four rules of arithmetic. The master had been trained in Dublin, and was in the first division of the first class. His salary from the National Board, including £13 for good service, was £65; besides this the Duke of Leinster gives £20 and a residence, and in the year 1868 the scholars paid £3 0*s.* 2*d.* The master has, however, to pay for all repairs to the building and furniture both of the school and his own house, so that his salary is not really as high as it appears to be. I have said that the room and furniture were kept in good order and repair, but it is hardly necessary to observe that, as a general arrangement, nothing can be more undesirable than to leave the duty of maintaining the buildings to the teacher. The master had no assistant, but two monitors. He told me that his monitors gave him a great deal of trouble, because they never remained long enough to become thoroughly efficient, but went off to some other occupation.

Teacher's salary.

Convent school.

152. The convent school contains two departments, for infants and for girls. In the infant schools seventy-two children, fifty-four girls and eighteen boys, were present, and in the girls' school twenty-eight. The children remained in the infant school till they were six or seven years old. I found fifteen of them reading in the Second Book, but very imperfectly. In the other school fifteen girls were in the third or fourth class, the rest in the second. They could read well and write fairly, but their spelling was very incorrect; in arithmetic they were backward, but fairly accurate in their work. The same causes which tend to shorten the period of attendance in the boys' school exercise a very prejudicial influence on this school also. Indeed the nuns told me that the number of children in the place who do not go to school at all is very large. Certainly the best use is not made of the existing schools; both in the boys' school and in this there was room for many more children than I found present.

Expense of conducting these schools.

153. The expenses of conducting those schools offer a singular contrast. The expenditure on the boys' school in 1866 amounted to £119 1*s.* 8*d.*, and the average daily attendance was fifty. Thus, the cost per head was £2 7*s.* 7*d.*, very nearly, and the local contribution supplied 9*s.* 2*d.* of this sum. The expenditure on the convent school was £68, and the average attendance 113; thus, the cost was only 12*s.* per head, and of this 3*s.* 5*d.* was derived from local sources. In other words, out of the funds provided by Parliament, £1 18*s.* 5*d.* per head are contributed towards the support of the National male school, while only 8*s.* 7*d.* per head are contributed to the female convent school; making a difference of 78 per cent. in favour of the former. A strong contrast is also presented by a comparison of the provision allotted to the Maynooth male school, with that which is assigned to the Celbridge school, as just given (paragraph 146). The State contribution to the Maynooth school is £1 18*s.* 5*d.* per head; to the Celbridge school it is £1 11*s.* per head; making a difference of more than 32 per cent. in favour of Maynooth. Many other instances can be found less striking than this which show that the amount of the Government grant is no measure of the efficiency of the school.

PART II.

Section III.—District of Wicklow.

County of Wicklow.

154. In the county of Wicklow my examination extended over a much larger area than in the county of Kildare, and in consequence I was enabled to make a complete inquiry into the circumstances of a small part of the district only, namely, the neighbourhood of Wicklow town. Besides this I visited other schools which might be considered fairly representative of the rest, situated at scattered points, but which had no peculiar features, and also two schools of which the circumstances were so remarkable as to render very minute inquiry desirable. The assistance of Mr. Stokes and Mr. Dunne enabled me to undertake the additional labour which was necessary in order to extend my observation over so much of this county, a very small part of which had originally been selected for examination. They not only accompanied me in my visits to many of the schools, and by taking a very large share of my work enabled me to collect all useful information relating to the schools we visited, and to form an estimate of their efficiency with great expedition; but after I had returned to England, they made a special visit to a school which I had not seen, and to two others which I have mentioned above as requiring a more searching inquiry than could be made at one visit. My account of this district, therefore, contains the result of their observations as well as my own, and in part is derived from notes with which they kindly furnished me. The portion of the county which we visited included the mountain district between Bray, Glendalough, and Rathdrum.

Wicklow town and neighbourhood.

155. In the comparatively populous neighbourhood of Wicklow town the schools are very numerous, and situated at no great distance from each other; but on the high inland districts where the population is thin and scattered the schools are, of course, much less frequent. However, I never saw any large collection of houses without a school. The chief occupation of the inhabitants of this district are agricultural; at the town of Wicklow a large number of persons is engaged in fishing, or other nautical pursuit, and in the neighbourhood of Glendalough the Mining Company of Ireland gives employment to a considerable part of the population.

Population and number of scholars.

156. The population of the town of Wicklow in 1864 was 3,404, of whom 770 were Protestants, a much larger proportion than in any other district which I visited. There are five schools in the town, a National school, a parochial school on the foundation of Erasmus Smith, and three small schools maintained by private persons. The number in attendance at all these schools on June 25th, and the estimated number of children of school age are exhibited in the following table:—

TABLE G.—Attendance of Children at School on 25th June; and Estimated Number of Children of school-age in Wicklow.

TABLE G.—Number of children present at school in Wicklow, on 25th June; and estimated numbers of children of school age.

—	Above 3 years and under 5.		Above 5 years and under 13.				Total above 5 years and under 13.		Total.
	Protestant.	Roman Catholic.	Protestant.		Roman Catholic.				
			Males.	Females.	Males.	Females.	Males.	Females.	
National School, . . .	–	65	2	–	88	50	90	50	205
Parochial School, . . .	7	–	28	22	–	–	28	22	57
Private School, . . .	3	3	3	5	6	12	19	17	32

Estimated number of School age,	41	137	62	68	206	227	268	295	741

157. The proportion of children at school is small, and in the case of girls remarkably small. The latter fact may be accounted for by the state of the national school for girls, which was not maintained vigorously, because a convent was being established to which the school would in future be attached. The infant school is inefficient from the same cause; and it may be expected that when the impending alterations have been made, the attendance of the children will be more satisfactory. The boys do not attend in such numbers as they do elsewhere, but the length of the period during which they remain at school is shortened by the demand for the labour of boys of eleven or twelve years of age and upwards in the fishery, which gives employment to many of the inhabitants. It must be noticed, however, that no interest appears to be taken in the national school by the manager or any other person, and this total indifference has a bad effect on parents who are not too eager to send their children to school, and who need to have their duty in this matter strongly enforced. Schools not in operation, and neglected.

158. The national school buildings were very poor; the girls' and infant schools were miserable, the boys' school rather better, but was situated on a slope so steep that the floor is at some depth below the level of the ground in front of the building, and the room is therefore very damp; the long and narrow shape is inconvenient, and there is no means of ventilation except by the windows. It is scarcely necessary to say that the school is not vested. The number of scholars present was eighty, of whom fourteen were in the higher classes. The boys in the third class read well, wrote from dictation almost without a mistake, but failed completely in arithmetic. The boys in the fourth class wrote very well on paper from dictation, and were more successful in arithmetic than those of the third class. They answered my questions on geography with great intelligence and vivacity. We also examined part of the second class in reading and writing, with fairly satisfactory results. The boys were very young, and for their age their proficiency was highly creditable. Two of the boys on the school rolls were members of the Established Church, but they were not present. The master had one assistant, but no monitors; he had been trained in Dublin, and was in the first division of the second class. His salary was £40, of which sum the National Board paid £32, and the rest was derived from school fees; a residence rent-free was provided for him. In 1866 the expenditure on teachers' salaries was £75 13*s.* 10*d.*, to which the local contributions were £12 3*s.* 10*d.* The average daily attendance was sixty, thus, the cost per head was £1 5*s.* 3*d.* nearly, towards which the sum of 4*s.* per head was contributed from local sources. We did not examine the girls' school when we discovered its state. National school.

159. The parochial school in Wicklow was closed at the time of my visit. We saw the buildings, which were excellent, in very good repair, and well provided with furniture. The school had separate departments for boys and girls, the teachers of which were married and lived at the school-house. The master's salary for conducting the school was £40, with an additional gratuity of £5 if the Inspector of the Board of Erasmus Smith made a favourable report. The master was also parish clerk, and received £10 on that account, thus raising his income to £55. His wife received £35 for conducting the girls' school. As the school was not in operation we could not, of course, form any opinion as to its efficiency. Wicklow parochial school on the foundation of Erasmus Smith.

160. In the neighbourhood of Wicklow we visited National schools at Rathnew, Glenealy, Ballylusk, and Ashford, and parochial schools at Rathnew and Glenealy.

161. The parochial school at Glenealy was held in a handsome gothic building, large enough to accommodate twice as many scholars as we found present, but owing to faults in its construction, the want of ventilation was more sensible than in many smaller and more crowded buildings. The number of scholars present was thirty-five—sixteen boys and nineteen girls, all of them Protestants. The age of the scholars in the highest class was very remarkable; of five scholars in the class only one was less than fourteen years old, and two were more than fifteen. Their proficiency was fair, but not so great as might have been expected from scholars of their age. In the next class also the scholars were of a comparatively advanced age, three out of five who constituted the class were more than thirteen years old, yet their writing was indifferent, they were not able to spell correctly, and their knowledge of arithmetic which did not profess to extend beyond Compound Multiplication, was very superficial. Six scholars were in the second class, two of them more than twelve years old, and one more than ten, the rest being under nine years. They read tolerably, but their attempt at writing from dictation was feeble, and only three of them were able to work a sum in Simple Multiplication by one figure. The rest of the children, all of whom were in the lowest class, we did not examine; but we had seen quite enough to satisfy ourselves that though great pains had evidently been taken to make the school efficient, the object had not been attained. The master had received no special training, he had no regular assistant, but the clergyman and his family frequently visit the school, and take part in the work. The master's salary, including £5 from the Church Education Society, and £3 1*s.* 9*d.* from school-fees, amounts to £48 1*s.* 9*d.*, and a residence is provided for him. Glenealy parochial school.

162. The National school is quite close to the parochial school, and is attended exclusively by Roman Catholics. It is non-vested, and under the management of the parish priest. The building consists Glenealy national school.

of one long low room, forty-five feet by fifteen, and only ten feet high; the windows are too few; and when the door is closed the atmosphere must be very close. The number of children present at our visit was fifty-two—twenty-nine boys and twenty-three girls. None of them had reached the fourth class, and only seven the third, yet in this school also the scholars were older than usual, though younger than the scholars in the corresponding classes of the parochial school; but their progress is retarded by the irregularity of their attendance at school. In one respect the contrast between the children attending the two schools was very apparent. In the national school bare feet and ragged clothes were common; in the parochial school all the scholars were well dressed, and some even pretentiously. The school was fairly efficient. Most of the children in the second and third classes could read and write, but their spelling was very incorrect. The scholars in the third class worked examples of the compound rules with tolerable accuracy. The second class knew nothing beyond simple multiplication, and the lower part of the class had learned addition only. The school was conducted by a female teacher, who was in the second class of the second division. The only assistance was given by monitors. The salary of the teachers for 1868 was £29 2*s.*, of which the National Board paid £24, and the rest was derived from school-fees. A residence is provided rent free, and the manager meets all the expenses for repairs, cleaning of the schoolroom, &c. In 1866, the expenditure for the teachers' salaries was £26 3*s.* 10*d.*, the contribution of the National Board being £20. The average daily attendance during the year was thirty-six, and the cost per head was nearly 14*s.* 6*d.*, and the portion of this sum which was supplied from local sources, 3*s.* 5*d.*

Rathnew.

163. The village of Rathnew contains nearly 1,000 inhabitants, and a large part of it consists of a number of miserable hovels, which are the property of the occupiers. This part of the village has been built on no system whatever; the owners have placed their cabins in any position they chose, and the consequence is, that the passages between the houses, form a labyrinth through which it is impossible for a stranger to find his way without a guide. Buried in a remote corner of this curious collection of dwellings is a hovel rather larger than the rest, which is the National school. The building contains one long low room open to the thatched roof, with a floor and walls of mud, and a smaller class-room separated by a partition from the large room. A few small windows admit a little light, and in summer, when they are open, some fresh air. The furniture was quite new and excellent, but we were told that this had been provided on the establishment of the school by the teacher and scholars, without assistance from the manager or any other person living in the neighbourhood. We found fifty-five children collected in this place, thirty boys and twenty-five girls, most of them very young. They were all Roman Catholics. The schoolmaster was untrained, and in the first division of the third class. He had no assistance of any sort in conducting the school. His salary from the National Board was £24, and from school-fees during the year 1868, £4 18*s.* 8*d.* No residence was provided, and the expense incurred by the teacher on this account was £7 10*s.* annually.

Disgraceful state of the National school.

164. The school is under the management of the parish priest of Wicklow, and it is hardly necessary to state that it is not vested. It has only been in operation since the year 1867, therefore the sanction of the National Board must have been given quite recently to the use of a building so thoroughly unfit for the purposes of a school. It may be thought that it is the duty of the manager to make better provision for the school. In the present case the manager appears to consider that he has done all that can be expected when he has appointed the teacher, and that any further effort on his part is quite unnecessary.

Parochial school.

165. The parochial school presented a marked contrast in outward appearance. The school-house was quite new, and contained a residence for the teacher. The school-room was not very large, but was quite sufficient for the number of pupils generally in attendance: the furniture was good and in perfect order. We saw it, however, at the close of the vacation, when it had been prepared for use. The children on the roll were all Protestants; the number was fifty, but the average attendance was only twenty-eight. The number returned by the constabulary was twenty-seven—twelve boys, ten girls, and five infants. The schoolmaster has no assistance except from his wife, who teaches needlework. He had been trained at the Church Education Society's school in Dublin. His salary amounted, in 1868, to £44, including the following items:—From the Church Education Society, £10; from the clergyman of the parish, £30; and from school-fees, £4. The payment from the clergyman includes the remuneration of his wife's services, Besides this he has an excellent residence, and a garden attached to it, rent free, and he said that he made a little money by giving private lessons.

Ashford national school.

166. At Ashford, a small hamlet, about two miles from Rathnew, there is a National school, which was established in the year 1866, and which is attended by girls of all ages, and boys who are under eight years. The buildings are good; there is one large school-room, with plenty of light and air when the windows are open. In winter the want of ventilation must be felt. The furniture was sufficient and in good order. Sixty-one children were present, one of whom was a Protestant; the rest were all Roman Catholics. Ten girls had reached the third class, some of whom, according to their own statements, were of very advanced ages. Three of them said that they were seventeen, and two others that they were sixteen years old; but I am convinced that they were wrong. They appeared to be much younger, and it was not at all uncommon to find that the children had most extraordinary notions about their age. All these girls read well, wrote fairly, and knew something of the four compound rules of arithmetic; all the rest of the children were in the first and second class. I examined some of them, and found them able to read from their lesson book, to write a little, a few of them knew the first four rules, but the greater number could do nothing more difficult than the addition of small numbers. The schoolmistress was appointed when the school was established. She was in the first division of the third class, but had not been trained. Her salary in 1868 was £25 3*s.* 2*d.*, including £5 3*s.* 2*d.* school-fees. A residence was provided rent free, and the manager provided for the necessary repairs, &c., of the school-room.

A school for boys wanted.

167. At this school boys are not generally admitted; but it did not appear that there was any boys' school in the neighbourhood, except the other National schools of this group, at which the number of girls in attendance was not less than the number of boys. It seems, therefore, that the establishment of a boys' school would be very useful.

168. The National school at Ballylusk is situated between Ashford and Glenealy, with no other houses in the immediate neighbourhood. It is a very small building, with stone walls and a roof of slates, but no ceiling, and only an earthen floor. The furniture was fair, and was kept in good order. Twenty-two boys and seventeen girls were present, all Roman Catholics, though one or two Protestant children attend occasionally. Three of the scholars had reached the third class, and one the fourth, and he alone was more than twelve years old. He could read and write fairly, and worked sums in proportion correctly. The scholars in the third class were, as usual, unable to spell correctly, and rather backward in arithmetic. The younger children, whom we examined, were able to read from their lesson book, and to copy a few words from the book on their slates; but very few succeeded in getting through an example of simple multiplication. The children were remarkably quiet and orderly. The school was conducted by the mistress without any assistance whatever. She was in the second division of the third class, and had been mistress of the school since the end of 1866. Her salary in 1868 amounted to £16 6*s.* 6*d.*, including £2 6*s.* 6*d.* derived from school-fees. No residence was provided, and the expense she incurred on this account was £6 per annum. Ballylusk national school.

169. In 1866 the expenditure on teachers' salaries was £20 18*s.* 7*d.*, and the average daily attendance thirty-four. The expense per head was, therefore, almost exactly 12*s.* The amount of school fees per head was 2*s.* 4*d.*; the contribution of the National Board only 9*s.* 8*d.*

170. This school, and the schools at Glenealy and Ashford, besides two others which we did not visit, but which, we were told, were very similar to these, are all under the management of the parish priest of Ashford, and several of them were established by him. A smaller number of schools would not meet the requirements of the district as well, because the population is scattered over a very large area. This is, however, the only instance which came to my notice of one manager undertaking the superintendence of so many schools. All these schools under the same manager.

171. In the northern part of the county we visited the schools at Enniskerry, and Roundwood, and several small schools on the road between these places. At Enniskerry there is a National school for boys and girls, and a private school for infants, both of which are maintained by Lord Powerscourt. The National school was in connexion with the Church Education Society until 1866, when Lord Powerscourt placed it under the National Board. The building was excellent, and was furnished and decorated in a manner quite unusual in National schools. The number of children present at the time of our visit was twenty-eight, and the number on the roll forty-one, of whom thirty-three were members of the Established Church, and eight Roman Catholics. Two-thirds of the inhabitants of the village in 1861 were Roman Catholics, and the number of Roman Catholic children in the school is therefore disproportionately small. We were told that many Roman Catholics sent their children to a National school among the mountains, which was under the management of a Roman Catholic clergyman. The Enniskerry school was not very efficiently conducted; the scholars in the highest class, who were above the average age, wrote fairly, but were very backward in arithmetic, and inaccurate in their work. The same deficiency in arithmetic was observed in the lower classes in a greater degree, and their writing was not good, nor their spelling correct. Enniskerry national school.

172. The master's salary in 1868 amounted to £66 19*s.* 3*d.*, and a house, with a garden rent free and fuel, was provided for him by Lord Powerscourt, who also paid £42 a year towards his salary. He was in the second division of the third class, and had been educated at the Church Education Society's school in Kildare-place. He was assisted by his wife, who was not paid directly for her services, Lord Powerscourt's contribution was given for her assistance in the school as a workmistress, and for the master's performance of the duties of organist in the church. Both were members of the Established Church.

173. We also visited the infant school, which was not in connexion with the National Board. Here also the Protestant children were the great majority, but a few Roman Catholics were present. Some of the children could read a little, but of course most of them were too young to know anything more than the alphabet. The room was good, and the schoolmistress appeared to do her work thoroughly well. A remarkable extract from evidence given before the Commission on Education in 1824, which relates to this school, will be found in Appendix III., (page 86). Infant school.

174. In this neighbourhood we visited two small schools supported by Lady Monck for the children of Protestant workmen on the estate. They were quite close to each other; one was an infant school, the other for boys and girls. In the latter ten children were present, of whom the four most advanced could read, but failed completely in arithmetic. They gave most ridiculous answers in geography and history, subjects with which they professed themselves to be acquainted. The school was in fact very useless; but, like the infant school, possessed at any rate the merit of keeping the children out of mischief.

175. For several miles southward the county appears to be almost uninhabited, but in a very desolate-looking spot called Annacarter there is a National school. The building, which contained a residence for the master, was in tolerable repair, and sufficient for the number of children in attendance. The number on the roll was sixty-nine, of whom fifteen were members of the Established Church; but the number present was only thirty-four, eighteen boys and sixteen girls. Some questions in geography were satisfactorily answered by the more advanced boys. The master, who had no assistance of any sort, had been trained in Dublin, and was in the first division of the second class. At the last visit of the Inspector, which only preceded ours by a few days, he had, as he told us with the most perfect good humour, been depressed because his school was not kept with proper order and neatness. His salary in 1868 amounted to £39 8*s.*; the part paid by the National Board being £32, and the rest derived from school-fees. He had, as was mentioned, a residence, and also three acres of land rent free, and his income was subject to no deduction whatever. The expenditure on teachers' salaries, &c., in 1866 was £56 8*s.* 6*d.*, and the average attendance thirty-six; the cost per head was £1 11*s.*, of which the local contribution was 6*s.* 9*d.* Annacarter national school.

176. About two miles from this school is situated the village of Roundwood, where there is a National school, and in the immediate neighbourhood a parochial school. The National school is held in an excellent building, which contains a residence for the teacher. The school-room is of sufficient size to accommodate a few more scholars than the number present at our visit, which was sixty-one, thirty-three girls and twenty-eight boys. They were all Roman Catholics; the Protestant children Roundwood national school.

Large teaching staff.

who live in the village and neighbourhood attend the parochial school. The teaching staff was very large—the master, his wife, and another assistant teacher, and one paid monitress. The assistant teachers do not receive the full salary, to which they would have been entitled if the number of children in attendance had been larger. Two years ago, when the Vartry reservoir was being constructed, a very large number of labourers were employed whose children attended the school, and for whose benefit the teaching staff had been increased. The children had clearly been carefully taught; they reached the standard required in the programme for each class, and did their work well. Five of the scholars were more than thirteen years of age, but, besides these, only two were above eleven years. The usual age on first coming to school was five or six years, and at leaving, eleven or twelve. The master had been trained in Dublin, and was in the second division of the first class. His salary for the year 1868 was £60 4*s.* 11*d.*, of which the part derived from school fees was £16 4*s.* 11*d.* He lived at the school, and his wife received some salary as an assistant-teacher. The expenditure on teachers' salaries in 1866 was £145 3*s.* 6*d.*, and the average daily attendance eighty-four. The cost per head was, therefore, £1 14*s.* 6*d.*, nearly, and the part of this sum due to local sources was 4*s.* 3*d.* per head. Both of the last-mentioned schools were non-vested; yet the buildings were good and residences provided for the teachers.

177. The rest of the schools which we visited were situated in the mining district of the county. The chief places included in this district are Rathdrum and Glendalough. Besides the schools situated in those places, a small school at Glenmalure, in a very solitary position, and two schools at Shillelagh, of which the circumstances were so peculiar as to demand special notice, were examined.

178. At Rathdrum there is a National school, with separate departments for boys and girls, a parochial school, on the foundation of Erasmus Smith, and a convent school.

Rathdrum national school.

179. The national school is vested in the Commissioners, and the patron is Lord Fitzwilliam. The building was in good repair, having been inspected by the Officer of the Board of Works during the year. The house was divided equally into two rooms, each thirty six feet long by eighteen feet wide. The number of boys in one room was sixty-six; in the other seventy-eight girls were actually present at the time of our visit, and the attendance of twenty-nine more, who were then receiving instruction at the convent school, was entered on the Report Book. This relief was almost necessary in order to prevent the national school from being intolerably overcrowded. In the boys' school sixteen scholars had reached the third class, and two the fourth. They wrote fairly from dictation, and, except in the lower part of the third class, were able to spell correctly; they failed comparatively in arithmetic; more than half the boys in the upper division of the third class were unable to work sums in compound long division correctly. The age at which the children generally begin to attend the school is not more than four years, a sign that an infant school is much wanted. Few stay after twelve years of age. We found three boys who were more than fourteen, but they had not been attending school continuously, and were not very advanced scholars. Four of the boys were members of the Established Church, the rest Roman Catholic, as was also the only teacher. He had been trained in Dublin and was in the second division of the first class. His salary was £74 1*s.* 6*d.*, including £13 1*s.* 6*d.* from school fees, and £6 paid by Lord Fitzwilliam. No residence was provided. In 1866 the expenditure for salaries was £85 19*s.* 10*d.*, and the average daily attendance fifty-five; the cost per head, therefore, was £1 11*s.* 3*d.*; the portion of this sum derived from local sources of all sorts was 6*s.* 11*d.*, and from school fees only 4*s.* 9*d.* or very nearly one penny per week per head.

Small amount of aid given to the girls' school by the Board.

180. The girls' school was conducted by Sisters of Mercy, who had a private school at the convent, where, as has been mentioned, some of the girls in the national school are sent. We understood that a school-house was being erected close to the convent, to which it was expected that the children now attending the national school would remove; the school at present in operation at the convent is for girls who can afford to pay for their education, and not in connexion with the National Board. The children were all Roman Catholics. The aid given to this department of the school by the National Board is very small; it amounted in 1866 to the sum of £19 10*s.* only; this grant was supplemented by local contributions and school-fees, which made up together £34. The average daily attendance in 1866 was 112, and the cost per head was, therefore, 9*s.* 6*d.*

Parochial school.

181. The Rathdrum parochial school has separate departments for boys and girls. In one twenty-two boys were present, in the other twenty-one girls and two little boys. Nine of the boys and four girls were orphans, provided for by Protestant Orphan Societies. These children are clothed at the expense of the Societies and lodged in farm houses in the neighbourhood, £4 per annum being paid for each to the persons who take charge of them, besides a fee of five shillings to the master or mistress of the school. All the children were members of the Established Church, and received instruction weekly from the clergyman. The master had been seven or eight years in the school, and during the last two years has held the office of parish clerk. The mistress leads the choir in the Church service.

Glenmalure national school.

182. Glenmalure national school is placed in a very wild situation, in the heart of the mountains, where the population must be very thin and scattered. The building was nothing more than four walls and a roof; it had neither floor nor ceiling. We found seventeen girls and thirteen boys present, of whom four were members of the Established Church, and eleven had reached the third or fourth class. The youngest child in the school was four years old, the eldest fourteen. The school was conducted by a young woman, who had only been appointed early in the summer, and was not yet classed. We were unable to examine the children, but we satisfied ourselves that the teacher could maintain order among her pupils and perform her other duties. A residence was provided rent-free, and she received £14 from the National Board, and the school-fees, which in 1866 amounted to £6 8*s.* 6*d.*

Glendalough; two schools where one is sufficient.

183. At Glendalough there are two national schools, not more than a mile apart—one is a school vested in trustees, with separate departments for boys and girls, under the management of the Roman Catholic curate; the other a school vested in the National Board, of which the patron is the Mining Company of Ireland. The very peculiar circumstances relating to this school required an especially searching inquiry. The vested school, known as St. Kevin's, was established first, and had been in operation for several years, when, in 1862, the other school, which is called Glendalough national

school, was founded. It is not very clear why this school was commenced. However, from the first the Roman Catholic clergy have shown the most uncompromising hostility to it, and have succeeded in preventing the attendance of Roman Catholic children. The master is a Roman Catholic, and his children attend the school, but the rest of the seventeen scholars on the roll are Protestants. The school-house, which was built by the Mining Company, with considerable assistance from the National Board, contains two school-rooms, of which one only is used at present, because of the small number of children attending the school. Both rooms were in perfect repair, and would have been models if the proper disposition and size of the windows had not been sacrificed to the architectural effect of the building. The children appeared to be well taught; their handwriting was excellent, and in spelling and arithmetic their proficiency was above the average. The eldest scholar was under fourteen years of age, and in the fourth class only, so that the master does not take advantage of the small number of his pupils to press them on to the highest class, in which he would be allowed to give instruction in more advanced branches of knowledge. It is to be remarked that the religious instruction in this school is given by the master, who is a Roman Catholic, and is attended by his children only, the rest of the scholars being Protestants. The master had been a pupil teacher in the model school at Galway, and while there attended lectures at the Queen's College. In 1863 he went through a course of training at the central establishment in Dublin, and in the same year graduated B.A. in the Queen's University. He is in the third division of the first class, but owing to the small number of children in attendance at his school, the Board no longer allows his full class salary. For three-quarters of last year the payment made to him by the National Board was £11 8*s*. The Mining Company provides an excellent residence, two acres of land, and adds £43 to his annual salary. Besides this he has the school-fees, which amount to £4 annually very nearly. The Company gives £12 annually in prizes for the school children. Thus the expenditure for the teacher's salary and the rewards to the children amount to £77 per annum, of which the National Board pays £15. In this estimate no account is taken of the value of the teacher's residence and ground attached to it. It is difficult to reconcile the payment made by the National Board with the principle by which the grants of aid to schools are governed, as stated in the "Rules and Regulations," Part iv., Sec. iv., 7 II.

Glendalough national school supported by the Mining Company.

Teacher's salary.

184. This school has also been specially favoured in the grant made towards its erection. This amounted to £277 10*s*., the sum stated in the "Rules and Regulations," Part ii., Sec. ii., 11, as the grant allowed to school-houses affording accommodation for 150 children. The dimensions of each room in this case are thirty feet by fourteen feet, and, therefore, the greatest number that can be accommodated is only 105.

Large building grant from the National Board.

185. The "St. Kevin's National schools" are under the management of the Roman Catholic curate of the district. Formerly there was but a single school, in which boys and girls were taught together, but about four years ago the parish priest built a new school-house for girls, with a residence for the teacher, and this school has been in operation since 1st March, 1866. This new female school is *not vested*, and the parish priest is the patron. The building is on the side of a very steep hill; the school is on the upper storey, but the floor is on a level with the ground at the back of the house. The lower storey is the teacher's residence, and from its position, half buried in the ground, the hasty and imperfect excavation of the foundation, is always damp, and in wet weather almost uninhabitable. The school-room is large and airy, and remarkably well appointed and furnished, affording accommodation, the chief room and a class-room, for 100 girls. On our first visit we arrived just as the school had been dismissed; and on the second visit the school had been dismissed before the usual hour, because some of the girls were wanted at the Roman Catholic church. The schoolmistress, who was here at our first visit, left soon afterwards, and was succeeded by a teacher who was untrained and not yet classed. The number of girls on the roll is eighty-one, all of whom are Roman Catholics. Sixty-six were present on June 25, and forty on the day of our first visit.

St. Kevin's National schools.

Want of judgment shown in the erection of new buildings for female schools.

186. The boys' school, which in the "list of (National) schools in operation on 31st December, 1867," is returned as *vested in trustees*, and is dignified with the name of "St Kevin's National Male School," is held in a wretched hovel, badly thatched, with holes in the roof; there is no ceiling, and a mud floor only, no ventilation, and great want of light. The room is thirty-eight feet long and twelve feet wide, thus affording accommodation for fifty-seven children; but so large a number of children cannot occupy this miserable place without rendering the atmosphere intolerably unhealthy. Notwithstanding the wretched accommodation sixty children were present. Some of them were very young, and might with advantage have been sent into the girls' school, where there was plenty of room, and proper care would have been taken of them. The highest class in the school was the third, and to this class only seven boys had attained. They were able to write and spell fairly, and worked sums correctly. In the second class the state of the children is much less satisfactory; the writing was poor, and by far the greater part of the class was unable to work a sum in simple subtraction. Not many of the boys were more than eleven years old, only three were more than twelve years old. They were all Roman Catholics, but before the opening of the school at Glendalough some Protestant children had attended this school.

Discreditable state of the boys' school.

187. The master was in the first division of second class, and had been trained in Dublin. His salary from the National Board was £40, including £8 good service allowance; he also received about £8 annually from school-fees, but no other addition was made to his income from local sources, nor was a residence provided. He had been at the head of this school for eighteen years, and appeared to be a little past his work. There was no assistant teacher, but two paid monitors took some part of the school work.

Teacher's classification and salary.

188. It is almost inconceivable that the state of this school should have been allowed to remain unnoticed by the authorities of the National Board, who return it on their latest list of schools as vested in trustees. The condition of repair is not creditable to those who are responsible for it. The new girls' school buildings would have been much more generally useful if the site had been better chosen, and more care shown in the construction. At no very great additional expense a room for the boys might have been built, and the teacher's residence rendered habitable. At present the lower part of the house is almost wasted; and while the girls' school-room is good, the boys are left in the miserable shanty which has been described. To crown all the carelessness which has been shown

Unsatisfactory circumstances of these schools.

in the establishment and maintenance of these schools, the lease of the ground on which they stand has been allowed to expire.*

189. Whilst these schools are in so unsatisfactory a state it is to be regretted that so much should have been done for the other National school under the patronage of the Mining Company without producing any result. If that school was erected in consequence of the insufficiency of the St. Kevin's school, the object of the founder would have been attained by the improvement of the existing school. At present one school is supplied with excellent buildings, and every appliance that could be desired to increase its efficiency, while the number of children in attendance is exceedingly small; and in the immediate neighbourhood another National school affords the means of instruction to a very much larger number of children, but is crippled by the utter unfitness of its buildings. One efficient school would be amply sufficient for the district, at present there is none.

Shillelagh.

190. Shillelagh is a small village on the property of Earl Fitzwilliam, close to his park at Coolattin. There are two schools at the village, one built and maintained by Earl Fitzwilliam, the other a parochial school under the management of the rector of the parish.

Lord Fitzwilliam's school.

191. Lord Fitzwilliam's school is not in connexion with the National Board. It is conducted on the system of the Kildare-street Society, as all the children read a chapter from the New Testament daily. The school-house contains two large airy rooms, one above the other, the upper room being rather smaller than the lower and more scantily supplied with school furniture. In the lower room sixteen boys and seven girls were present, in the upper room ten boys and eleven girls, forty-four in all. The number returned by the Constabulary was seventy-five, including twenty-four infants; on the school rolls the names of sixty-one boys and forty-five girls are entered. Six of the children present were in the fourth class; they were all able to read, but only half of them could write tolerably from dictation, or work a practice sum. Eight children were in the third class, and their proficiency was even less satisfactory. The children in the second class were scarcely able to read, could not write, and were ignorant of arithmetic. The school considered as a means of giving instruction was a simple failure; yet the teaching staff was out of all proportion to the number of children, and the salaries of the principal teachers, at least, unusually high. The principal teacher said that he was a member of the Established Church, but he had been trained at the Wesleyan Training College in Westminster. His wife was the chief female teacher, but her duty is merely to teach needlework during a small part of each day. Besides these, two assistant teachers, one male the other female, took a share of the work; they were Roman Catholics. Here it should be noticed that although both the principal teachers were Protestants, most of the children were Roman Catholics. Out of the number returned by the Constabulary as present at their visit only six were Protestants, while sixty-nine were Roman Catholics; the number of each religion on the roll were six and ninety-nine, respectively.

Inefficient state of the school.

Salaries.

192. The salary of the master and his wife is £80, but in addition to this he receives £5 for conducting a night school; an excellent furnished residence with two gardens is provided by Earl Fitzwilliam, and allowances are made for fuel both in the master's house and in the school, for the payment of two servants, and for all things required in order to keep the house and furniture in order. A field is given to him on which he may feed a cow, or instead of this, he is provided with butter and milk for the use of his family. The male assistant receives £30 annually for teaching in the day school, £5 for the night school, a free unfurnished house in the village with a good garden and fuel. The female assistant receives £4 without any other emoluments; although her salary is so small this teacher takes a considerable share in the work of the school, as the younger children are chiefly under her care; the other female teacher's duty was, as has been remarked, to teach needlework for an hour daily.

193. With all this outlay on the teaching staff, the school might have been expected to be fairly useful, but in fact it is much less efficient than an ordinary National school. The want of proper inspection is without doubt the cause which tends to render the teaching less active and energetic than it ought to be; indeed irregularities are liable to occur here which would not happen in schools so strictly watched as the National schools. For instance, at half-past eleven on a day when the school was in operation as usual, the master was found absent attending to some of his domestic affairs.

194. This school was founded before the institution of the National Board; yet its plan carries the idea of religious equality further than the rules of the Commissioners. It appears six and-thirty years ago to have been in a condition far more flourishing than at present, and in 1833 it obtained a high eulogium from one of the earliest of the Board's Inspectors:—

Report of Dr. Murray, Board's Inspector for 1833.

"I cannot avoid expressing my unqualified admiration of the school at Shillelagh,† modelled after an idea of Lord Milton, and superintended by Robert Challoner, esquire. This is a strictly National school, having Protestant and Catholic masters and mistresses, and is in the highest degree efficient, possessing a collection of farming implements, curious natural objects, and models of machines; in short, it is a little university for the poor."

Its present condition, attributable probably to the absence of regular official supervision, is calculated to raise a question whether the large sum annually expended by its noble owner in maintaining it might not produce benefits more solid and more extensive if employed in founding and supporting efficient National schools on different parts of his lordship's property.

195. The school is intended for children of all religions, but does not succeed in attracting Protestants, who, with a few exceptions, attend the parochial school. The parents of the Protestant children who attend the school are in Lord Fitzwilliam's service; and it was said that pressure had been ineffectually used to procure the attendance of other Protestant children residing on the estate.

* The lease of the ground upon which St. Kevin's schools stand expired on 15th August, 1852. According to the Rules of the National Board, the then existing school thereupon ceased to comply with the conditions which would entitle it to be classified as a "*vested school.*" Nevertheless, the Commissioners of National Education have ever since continued to designate it in their "Annual List of Schools in operation" by the letters "*V. T.*," *i.e. vested in trustees*, precisely as if the original conditions upon which it was first classed as such, still continued in full force. Even in the Appendix to their very latest Report, that for 1867, published only a few months since, they so classify it in their "List of Schools."
The amount of reliance which the Statistical Tables and papers published by the Board deserve, is illustrated by this instance of continued misinformation.

† Not connected with the Board.

196. The parochial school is supported partly by subscriptions, and partly by the interest arising from funds collected by the clergyman of the parish, chiefly in England, in order to establish a school in opposition to Lord Fitzwilliam's school. The school rolls contained the names of twenty-six boys and twenty-four girls; fourteen boys and thirteen girls were actually present, all Protestants. The master and his wife conduct the school; he had been trained at the Church Education Society's school in Kildare-place, she had not been trained at all. The clergyman said that he considered the master's place to be worth £53 per annum. the salary being £45, and the residence worth £8. For this remuneration the schoolmaster performs the duties of assistant clerk, the present holder of that office being very old, and the schoolmistress is also sexton. Shillelagh parochial school.

197. Of the efficiency of this school I have no account to give; its existence in opposition to the other school, and the manner in which it is supported are sufficiently significant.

PART II.

Section IV., (1) the City and Suburbs of Dublin.

198. The district of Dublin includes the city and its southern suburb, which extends along the seashore as far as Dalkey. These divisions of the district, as might have been expected, have not many characteristics in common, and in Dublin itself there is a considerable difference in the character and circumstances of the inhabitants of those parts of the city which are situated on the northern and southern bank of the Liffey. In north Dublin there is great uniformity in the outward appearance of the houses and their inhabitants; except in one not very extensive quarter, the population appears to belong entirely to the poorer classes, without showing any of the signs of extreme poverty. It is true that I was told that in the neighbourhood of the sea there was great destitution and want, but still there was no part of north Dublin which could at all be compared in appearance, at least, with the places on the south of the river, such as the Liberties, where the ruinous houses are crowded into filthy lanes and courts, the inhabitants suited to the dens in which they live, and numbers of half clad children straggling in the gutters at all times of the day. Though in south Dublin there are spots such as this, there is also a very large quarter inhabited by persons of the wealthier classes, and a still larger district from which the outward signs of poverty are almost entirely absent. Much of this part of Dublin is semi-suburban, and in it is included a chain of almost independent towns, extending from Inchicore on the west by Rathmines and Donnybrook to Irishtown and Ringsend on the east. Extent of the district of Dublin. Variety in condition of the population in different parts of the city.

199. The general character of the populations of the two parts of Dublin differ in another important respect; the proportion of Roman Catholics is rather larger in north Dublin than in south Dublin. In north Dublin out of twenty-six persons on the average twenty are Roman Catholics, five members of the Established Church, and one a Presbyterian or a member of some other Protestant body. In south Dublin out of the number of twenty-six the representatives of each religion are nineteen, six, and one respectively. This difference is greater than it appears to be, because in the wealthy quarter of south Dublin the Roman Catholics are not a large majority of the inhabitants, whilst in the poor districts they far outnumber the Protestants. In north Dublin on the other hand the distribution of persons of each religion is tolerably uniform, though here also the richest parish is that in which the proportion of Protestants is largest. Distribution of the population with regard to religion.

200. I arrived at these conclusions after a careful study of the Census Returns for 1861, from which also I made a calculation of the number of children of school-age, i.e., more than five years old and less than twelve, and the number of each religion, assuming that the children are distributed in the same ratio as the general population.

201. The following tables contain the results of my calculations, and the numbers of children in attendance at different classes of schools on the days of the visits of the police. One or two schools which were closed on that day I have since visited, and in such cases I have added the number of children whom I found in the schools to the numbers given in the police returns. The classes into which I have divided the schools require some explanation. National schools include the model schools but not workhouse or prison schools; convent schools, which are not in connexion with the National Board, were described in the list which I received before I commenced my inquiry in this district as being conducted by members of different religious orders, principally by Sisters of Charity. Private schools I have divided into two classes in the tables relating to North Dublin, and into three in the table relating to South Dublin. In the first class I have placed schools such as the Presbyterian Mission Schools, the Bethesda Orphanage, the Lurgan-street Ragged schools, all situated in north Dublin, and schools of the same sort in south Dublin, the most important being the Ragged schools of the Society for promoting Irish Church Missions; in the second, all schools which were distinguished on my list as deriving no support except from the payments of the children; I imagine that in north Dublin one or two small endowed schools are included among these, as I cannot find any other trace of them, and private schools are inserted which are situated in the same neighbourhood as these endowed schools. The matter is not of the least importance, however, as the effect on the general conclusions to be drawn from a consideration of the facts indicated in these tables will not be affected by the transference of a small school from one class to another, or even by its omission altogether. The schools included under these heads in the tables relating to south Dublin are of the same character; but in this part of Dublin there are several schools which though they may fairly be called private schools, are yet somewhat different from those already mentioned. These have been included in the third class. Some of them are schools about which it is stated that in them higher branches only are taught, or that they are classical schools—in several such schools the attendance was not counted by the police, apparently because the conductors of the schools objected. Boarding-schools also I have placed in this class. In this table, under the head of parochial schools, I have included one or two schools which are not, strictly speaking, parochial, but are of the same character as parochial schools, *e.g.*, the Kildare-place schools. The endowed schools are those only of which the endowment is the distinguishing feature. Many of the parochial schools, and at least two National schools, possess endowments, but these I have placed under their proper heads. I have not taken any account of the workhouse, prison, or military schools, because, in making my estimate of the population, Explanation of the way in which the tables of school attendance have been drawn up.

I excluded all persons who were described as resident in public or charitable institutions; it would not therefore have been right to include the schools attached to such institutions, when the number of residents in the institutions had been expressly omitted from the sum of the general population.

202. Four columns in each table contain the number of children in attendance at infant schools; the corresponding estimates of the number of children of proper age attend such schools, were derived from a calculation of the numbers of each religion between the ages of three and five years. The last three columns show the per-centages of children actually present in the schools on the day of the police inquiry attending the different classes of schools; the last row shows the per-centages of the whole number of children of school age in attendance at any school.

203. The results exhibited on these tables afford decisive evidence on three important points—(1.) The proportion of all children of school age who attend schools of any sort. (2.) The proportion of children of each religion. (3.) The extent to which the National schools supply the means of education.

Less than half the children of school age attend regularly.

204. With regard to the first point, it appears that less than half the estimated numbers of children were present at school on the day of the police inquiry. It cannot be concluded that the rest of the children never attend school at all, or that all of these are regular attendants; but it is, I think, fair to suppose that the number present on a given day is not very different from the average number. From this supposition it follows that if all children attended with the same degree of regularity, none would be at school during one half of the year; but the fact is, that in every school there is a considerable nucleus of regular attendants, and that the rest of the children whose names are on the school rolls, come to school but very seldom in comparison. If the regular attendants amount to one-third of the average daily attendance, the rest of the children attend on the average during less than two-fifths of the year. The reason is this; the average daily attendance (assuming it to be nearly the same as the tables indicate) is less than one-half of the number of children who might attend; the one-third of the average number of children present in school, that is less than one sixth of the whole number of school age, attends regularly, the remaining two-thirds of the scholars are supplied from the casual attendance of the remaining five-sixths of the general population.* If each of these children attended with the same frequency, the number of days on which he was present would be two-fifths of the number on which the schools are open. Of course these casual attendants do not attend with the same frequency, and while some of them are not very irregular in their attendance, others scarcely ever appear at all. If the data are correct, it is not too much to assume that fully one-half the children attend schools so seldom as to render the benefit they gain inappreciable.

Proportion of scholars of each religion.

205. With regard to the second point, the results for the two divisions of the city are different. In north Dublin, the proportion of the Presbyterians at school is much the largest of the three, whilst in south Dublin the proportion of children of the same denomination is the smallest. In north Dublin the proportion of Roman Catholics at school is the second in magnitude, and in south Dublin, first. The members of the Established Church hold the worst position in north Dublin, but are superior to the Presbyterians in south. Under the class Presbyterians, I wish it to be understood that all Protestants who are not members of the Established Church are included. In north

* An example may make this reasoning more intelligible. Suppose that there are 200 school days in the year, and 60 scholars, according to the circumstances observed, the average daily attendance will be 30, and the whole number of attendances therefore in the course of a year, 6,000: 10 scholars are regular and make 2,000 attendances; therefore the remaining 50 children make but 4,000 attendances; that is, each of them on the average attends on 80 days, or two-fifths of the whole number of school days.

Dublin the Presbyterians are a very large majority of these persons, but in south Dublin they are more on an equality with other Protestant bodies. The small attendance of children of this class in south Dublin must not be supposed to indicate especial negligence in the performance of their duties on the part of Presbyterians. Indeed, judging from the results obtained in north Dublin, where the Presbyterian body is predominant, children of this communion are unusually regular in their attendance at school.

Reasons for the small proportions of scholars belonging to the Established Church.

206. In the case of members of the Established Church two reasons can be assigned for the small proportion of children of this body who are in attendance at school. The estimated number of children is too high or the returns of the attendance too low. I calculated the number with great care, on the supposition that the number of children of each communion was proportional to the number of the general population who belonged to the same; and unless this assumption is wrong the first reason is nugatory. The second is more serious. Several schools, which, from their description, I should imagine to be attended by members of the Established Church, were closed for the vacation on the day of the visit by the police, and at some of the schools actually in operation, which professed to be of a superior grade, the police were not permitted to count the attendance. Making every allowance, however, there will still remain a comparative deficiency in the attendance of children of this creed, except in the infant schools, in which the proportion of children of the Established Church is very large. I noticed in schools, attended principally by such children, which I visited, a tendency to keep children in the infant schools after they had exceeded the age at which I should have expected to find them in the higher departments. The comparatively small attendance in the higher departments is, doubtless, partly due to this proceeding.

National schools generally attended by Roman Catholics only.

207. On the third point little need be added in order to explain the results which the figures indicate. It should, however, be noticed that the only National school in north Dublin at which there is any considerable attendance of members of the Established Church is the central model school. There are two other schools under Protestant managers at which some children of this class were in attendance, but the number was very small. In Roman Catholic National schools there were no Protestants, except in a very few cases, which will be noticed hereafter. In south Dublin there are two National schools under the management of clergymen of the Established Church, and these contained nearly all the children of this class who attended National schools. Some, however, attended the two district model schools situated in this part of Dublin. The other Protestant children who attended National schools were either in the model schools or in National schools under Protestant managers, who were generally speaking of the same religious body as the majority of the children.

Vide §§ 47, 48, 49.

208. The conclusions to which I have come on these points agree, in the main, with the statements made to me by persons with whom I have had any communication in the course of my inquiry. No one denied the existence of a great mass of children, whose attendance at school was so infrequent as to be quite useless for any educational purposes. I was, however, informed by many persons that the attendance of Protestant children was very general and regular, and that the great failure was among the Roman Catholic children. The facts appear to be the reverse, the difference in this respect between the children of different religions being in favour of the Roman Catholics.

Causes which prevent attendance at school.

209. With regard to the causes of non-attendance at school and means of producing a better attendance, I have little to add to the remarks which I have already made on the subject, and which had special reference to the state of this district.

210. It is clear, however, that the non-attendance of children must be due either to the negligence or unwillingness of their parents to send them to the school, or to a deficiency in the school accommodation provided. From my examination of different schools I was able to form an opinion as to the extent to which some of the available means of instruction were used. But as the range of my inquiries was limited to certain classes of schools only, I cannot pretend to do more than supplement the information obtained by the Royal Commissioners who inspected the model and convent schools, in which very nearly one-half of the children who attended school at all are educated.

National schools sufficient for the scholars now in attendance, but would need extension if the number of scholars were increased.

211. Those national schools which I visited did not appear to be capable of accommodating any very large increase in the number of children who were present; and a comparison of my notes with the returns of the police shows that the numbers present at my visit do not differ materially from those present when the police counted the attendance. If, therefore, by any means, a greatly-increased attendance in the national schools were produced, large additions to the existing buildings and to the staff of teachers would be necessary. Such an increase, however, is not likely to take place unless the habits of the population are altered, for the average number of children now in attendance is much the same as it has been for a considerable period.

Parochial schools need a total change of system.

212. In the parochial schools there is plenty of space for additional pupils; but the staff of teachers, as at present constituted, would be quite inadequate to give useful instruction to them if they came. At first sight the case appears to be otherwise, because in the parochial schools the proportion of teachers to the number of scholars is, in general, larger than in the national schools; but the circumstances of the schools are so different that the apparent excess of teaching power in the parochial schools is rendered useless. These schools are very numerous, and in many of them the teacher has only a small number of scholars whom he instructs without any assistance from monitors or assistant teachers. With a small number of scholars it may be possible for one unassisted teacher to make some progress, but a very slight increase in the number of pupils might reduce the teacher to the necessity of neglecting one class of children for the sake of another, or of teaching simultaneously scholars of all degrees of proficiency. In the account of my examination of both, which follow, it will be seen that I have noticed this tendency in the schools even under their present circumstances; and if the number of Protestant children who at present are very irregular, should become frequent attendants in the parochial schools, a great change in the constitution of the schools would be necessary in order to render them efficient. In these schools, as in the national schools, it did not appear that any increase in the attendance of scholars was probable; and such persons as I saw who interested themselves in these schools, gave me to understand that the number of children of the class which usually attend such schools habitually absent from school was not large, and that a large increase in the numbers in the school could only be caused by the application of children of other creeds for admission to these schools which are connected with the Established Church.

No increase in the number of scholars expected by persons acquainted with the localities.

213. On the whole, therefore, I think that the means of education at present provided by the national schools are sufficient for the number of scholars using them, and by extension and increase could be made to supply the wants of still larger numbers should it be necessary to make any arrangements for this purpose. The parochial schools, however, could not supply the wants of a larger number of scholars unless the system adopted at present were altered, and a staff of assistant teachers and monitors were employed as in the national schools.

Large attendance at private schools no sign of the insufficiency of the national schools.

214. There is one fact which seems at first opposed to this conclusion. The tables show that a considerable number of children attend private schools; these private schools are very numerous, and many of them in the immediate neighbourhood of large national schools. It may be thought that the children who cannot receive instruction in a manner which satisfies their parents in the national schools go to these private schools, or that they are driven to them because there is no accommodation for them in the national schools. All these private schools depend for their support on the payments of the pupils, and many of them are distinctly intended for children whose education is intended to include more than the first elements of knowledge. But however unambitious these private schools may be, the fact remains that the children who go to them must pay; and since the number of scholars in each school is in general very small, the payments cannot be very low. The children of the poor, therefore, for whom the national schools are intended will not obtain admission into these private schools, which apparently supply the demands of another class of society. In support of this view of the object of the private schools is a remark which was not infrequently made to me that persons whose rank was a little removed from the labouring class were very unwilling to send their children to schools such as the national schools, where they would associate with companions of a class not the same as their own, and whose acquaintance their parents thought very undesirable.

Poverty and neglect of parents the great obstacles to education.

215. The causes of infrequent attendance at school must, therefore, be considered to be due to the circumstances of the children and not to a deficiency in the supply of schools. I have already mentioned that extreme poverty interferes with the attendance of many children, and that the eagerness of parents to turn the labour of their children to profitable account is another hindrance to their education, and even when the parents do not actually prevent their children from going to school, they do not enforce regular attendance. Indifference and neglect are greater obstacles in the way of education than the poverty which compels parents to send their children to work at the earliest opportunity. The crowds of idle children who are to be seen at all times in the poorer districts, straggling about the streets are not kept away from school in order to earn a few pence by their labour. Such are, in the opinion of persons who as managers of schools or in other capacities have the best opportunities for acquiring a knowledge of the facts of the case, the chief causes which hinder the education of the children of the poor; it still remains to consider whether any reasons can be assigned for the fact that the means of education which are provided by the State are not more extensively used.

Clergy of the Established Church oppose the National schools,

216. In the first place, it will be observed that the number of children who are members of the Established Church, and who attend national schools, is smaller in proportion than the numbers of any other religious body. The almost universal opposition of the clergy of the Established Church to the National system is not less effective in the city than in the country. Their objection I have already endeavoured to reproduce, and here I would only notice that they are able to exercise influence sufficient to prevent the attendance of children of their creed at schools of which they disapprove. In the case of Roman Catholic children, the schools which compete with the national schools are those of the Christian Brothers. It was mentioned several times to me in the course of conversation that the Roman Catholic clergy encourage attendance at the Christian Brothers' schools in preference to the national schools; and I knew of one case in which a parish priest had arranged to withdraw his school from connexion with the National Board, and to place it under the Christian Brothers. The number of schools conducted by this community is small in comparison with the number of national schools, and schools of both kinds are not situated in the same neighbourhood, so that the competition between the schools is not very keen. I was told, however, in several national schools that it was not at all uncommon for promising boys to be taken away in order that they might go to a Christian Brothers' school, which was situated at some considerable distance from their homes.

and of the Roman Catholic Church prefer the Christian Brothers' schools.

217. Roman Catholic children attend private schools to some extent, but I have already explained that such children do not belong to the class from which the primary schools draw their scholars.

PART II.

Section IV.—2. Schools in North Dublin.

218. The information which I have given has hitherto been collected from reports and returns of different kinds with which I have been supplied; though occasionally my personal observations have enabled me to supplement or to correct them. I now proceed to give an account of the state of those schools which I visited. In north Dublin, besides the model and convent schools there are four national schools, complete in all their departments, for boys, girls, and infants: St. Paul's, St. Michan's, St. Patrick's, and St. Peter's, Phibsborough, all Roman Catholic schools. Besides these there is a national school with separate departments for boys and girls in connexion with the Presbyterian congregation; a small mixed school under the Wesleyan chapel in Blackhall-place; four schools for girls and infants only, and two for boys only, the last five being Roman Catholic schools. There are ten parochial schools in the same district, all of which, except one, have separate departments for boys and girls; and all, except two, a separate infant department. There are three establishments of the Christian Brothers and four convent schools which are not in connexion with the National Board. At one of these a return is made of the attendance of a large number of boys. Probably infants would have been the correct description of the children.

Schools in north Dublin.

In the eastern half of the district.

219. The distribution of the national schools does not agree entirely with the distribution of the population. In the portion of the district which lies on the eastern side of the line of Sackville-street there is only one school for boys besides the model schools; in the large and populous parish of St. George, which includes a considerable portion of this neighbourhood, there is no National school for boys. The large school in North Richmond-street, belonging to the Christian Brothers, is attended by the Roman Catholic children in the parish, and there are two parochial schools. In

the parish of St. Thomas, which contains the rest of this portion of the district, the model schools and St. Patrick's National schools are situated; but the former of these I was told did not draw its pupils from the population living in the neigbourhood only, but was attended by children from all parts of Dublin. On the western side of Sackville-street the National schools are more numerous, and with the assistance of one Christian Brothers' school supply the means of education to all the Roman Catholic children in the district.

St. Patrick's National school.

220. St. Patrick's National school is situated in a district of which the inhabitants, according to the account of the manager, for the most part were all of the poorest class, and in consequence the children, especially those of more advanced age, were very irregular in their attendance. The chance of work was sufficient to keep them away from school, and very often want of food and clothes was said to be the cause of their absence.

Good building.

221. The schools were placed under the National Board in 1866, but they had been in operation for many years. The buildings were new and excellent, consisting of four large rooms, two on the ground floor, and two of the same size above them. The windows on the ground floor were placed at such a height as to render the rooms rather dark, but as they were open they made excellent ventilation. On the ground floor the girls' and infants' departments were placed, the schools communicated but were perfectly distinct. In the infant school 81 children out of 169 on the rolls were present, all of them Roman Catholics. The children were kept in this school until they were seven years old, and were then sent into the higher departments of the school. Some of the elder children were learning to read in the first book, but the great mass could do nothing except point out a few of the letters. The schoolmistress was in the first division of the third class, but had not been trained, she had two assistants, one in the same class, and the other a probationer; then the proportion of teachers to children, viz., one to twenty-seven, was unusually large. The room, according to the rules of the National Board, ought not to contain more than seventy-eight children, but its height and the unusually good ventilation rendered the state of the atmosphere tolerably wholesome.

Infant school.

Girls' school.

222. The girls' school-room was rather larger, but in other respects similar to the infants' school. The number the room could accommodate was 109, the number on the roll 137, and the number present 63. All the children were Roman Catholics, and the mistress did not remember any instance of a Protestant child applying for admission. No girls had reached the fourth class, but eight per cent. were in the third class. Most of these girls wrote fairly on their slates from dictation, and had learned the four simple rules, and three of the compound rules of arithmetic; the girls in the second class transcribed from their book or reading lessons, and some of them were able to work easy sums in simple multiplication, but many could do no more than add, and their work was very incorrect.

223. The teaching staff was smaller than in the infant school, it consisted of the principal teacher who had been educated at the King's Inns-street convent schools, and was in the first division of the third class, an assistant teacher who was only a probationer, and one monitress. Thus, the proportion of teachers to children here was very high, being one to thirty-two, without taking any account of the monitress. The salary of the teacher of this school was £31 8*s.* 8*d.*, including school fees, and the manager's gratuity of £3. The teacher of the infant school received the sum of £31 10*s.*, the difference in the amount of her salary being due to the school-fees, which in her department had been slightly larger in amount. No residences were provided for either teacher, but they incurred no expense on account of the school.

Boys' school, No. 2.

224. The upper part of the building contained two schools for boys—one for boys between the ages of seven and nine years, the other for older boys. The rooms are rather larger than those on the ground floor, as they extend over a large vestibule by which the building is entered. Both rooms were large and airy, and better lighted than those on the ground floor. The second school-room was large enough to accommodate 109 children; the number on the rolls was 138, and the number present 77, all Roman Catholics. Some of the boys were in the second class, they read from their lesson book with unusual ease, wrote a short sentence from dictation with scarcely a single mistake, and could add and subtract correctly. The schoolmistress asked them questions on the text-books of geography and grammar, which they answered very readily, and with more intelligence than could have been expected. Judging from the proficiency of this class, I should say that the school was one of the most efficiently conducted which I saw in the course of my inquiry. The teaching staff here was at the time of my visit very large; the principal teacher who had been trained at the model schools, and was in the first division of the third class, and two assistants, one of whom was in the third division of the first class, the other only a probationer; the senior assistant was, however, only temporarily employed in the school. The teachers in this room were women; they seemed to succeed much better than male teachers in teaching the little boys, and to pay more attention to the personal appearance of their scholars, who though very ragged were remarkably clean and neat.

Boys' school, No. 1.

225. The other boys' school-room was the largest in the building and had the smallest number in attendance, though not the smallest on the roll. The room could accommodate 138 scholars; the number on the school-roll was 162, and the number present fifty-nine. Although the lower boys' school was filled with scholars in the first and second classes, yet in this school three-fourths of the whole number present were in one or other of the same classes. The difference between the scholars in the two schools was in age only; the boys were sent on from the lower school as soon as they had reached the age of nine years. The greater number of boys in the lower part of this school, however, had not passed through the lower school at all; many of them began their education in this school, and, attending in the most irregular manner, made very little progress. The boys whom I examined were inferior to the boys in the same class in the lower school in all respects, and the small number of boys in the higher classes had not attained the average proficiency; arithmetic was especially poor throughout the school. The school, however, had not been in operation for more than two or three days since the vacation, and therefore the time of my visit was most unfavourable. The master had been trained in the model school, and was in the first division of the second class; he had one assistant teacher and one paid monitor. His salary, including school-fees and £5 from the manager, was £42 14*s.* 4*d.*; the salary of his wife, who was the principal teacher of the other boys' school, was £27 6*s.*, but she received no gratuity from the manager. A residence in the school-house was provided for them, rent free, and all expenses for repairs, &c., were discharged by the manager.

Manager constantly visits the school,

and collects funds for its support.

226. Whilst I was examining the boys' school, the manager came into the room on his daily visit to the school. It is not very common to find so much interest shown in the success of a National school, even by the person who, having established the school, may be expected to exercise some supervision over it afterwards. In the present case the Reverend W. Purcell had erected excellent buildings, maintained them in perfect repair, and provided good and sufficient furniture. For all these purposes, and to supplement the salaries of the teachers, he collected annually about £50 by private subscriptions and £22 by a charity sermon. He told me that he was unable to give the teachers as much as he thought they ought to receive, and that if there were any means for giving relief to the very poor who abounded in the neighbourhood, the attendance in the school would probably be much improved. The numbers present on the day of my visit were rather smaller in the girls' and lower boys' schools, and considerably smaller in the boys' and infants' schools than the numbers given in the police returns. The difference is to be accounted for by the fact of the vacation having ended only two or three days before my visit.

Gloucester-st. Scriptural school.

227. In the immediate neighbourhood of these schools is a large school in connexion with the Church Education Society. The school was established and maintained by the late Lady Harberton, who, I believe, used to take a considerable share of the work of conducting the school. The school contains separate departments for boys, girls, and infants; but no boys were allowed to remain in the school after the age of twelve years. None but female teachers are employed in any of the schools, but ladies who live in the neighbourhood visit the schools regularly, and give their assistance in teaching. The schools are managed strictly on the parochial system; the reading of Scripture is compulsory on all the children, and considerable time is spent in religious instruction of different kinds. There was no time-table used in any of the schools, but the teacher of the boys' school gave me from memory the

Boys' school.

following account of the way in which the school-day was spent:—The children assembled at 10, and after prayers worked at arithmetic or writing till 11; from 11 to 12 repetition of verses of Scripture, &c.; 12 to 1 history and geography; 1 to 2 an intermission; 2 to 3 Scripture reading and prayers, after which the children were dismissed. As in almost all Dublin schools the first hour, from 10 to 11, is wasted by the unpunctuality of the children, and this school is not, I believe, an exception to the general rule, it appears that nearly one-half of the available time is devoted to religious instruction. The consequence is that the children are by no means proficient in secular knowledge. In the boys' school thirty-nine scholars were present of all ages between seven and twelve years, most of them Protestants, but I understood that some of them were the children of Roman Catholic parents or of mixed marriages. The boys were divided into three classes; the lowest contained 8 boys who were able to read easy words of one syllable, to make a few letters on a slate, and to count. The next class contained 13 boys, 8 of whom read from Whately's Scripture Lessons without great difficulty, though a word of any length puzzled them, the rest of the class could scarcely read at all; some of them were able to write a copy of a few words written for them at the head of their slates, and could add up four columns of figures. The highest class contained eighteen boys, of whom five read with ease, and nine fairly, from a book used by the fifth standard under the English revised code; they read very badly—as badly as any boys in the lower classes; they could write, but not from dictation, and knew the first four rules of arithmetic imperfectly. The teacher had two assistants, so that the ignorance of the scholars is not due to weakness of the teaching staff. The boys behaved exceedingly ill, indeed the teacher seemed to have very little control over them.

Girls' school.

228. The girls' school was very quiet and orderly, and so far contrasted favourably with the other, but in secular knowledge the proficiency of the scholars in both schools was much the same. The number of girls present was thirty-nine, and they were divided into three classes corresponding to those in the boys' school. More than half had reached the highest class, but in this school there was no limit to the age of the children. The teacher had but one assistant, but the ladies who visited the school assist in this department.

Infant school.

229. The infant school was the most efficiently conducted department; it contained between 50 and 60 children, of whom a very few were able to spell out a verse from the New Testament. The great accomplishment that these children had acquired was the repetition of a set of answers to questions in geography and astronomy, both questions and answers being such that the children could not possibly have the slightest notion of their meaning. Bread and clothes are given to some of the poorer children in the school, but the prospect of these gifts is advertised as an inducement to attendance. The school buildings were very fair, but the supply of furniture was not sufficient, the desks were too few in the boys' and girls' schools.

Summer-st. Scriptural school.

230. In the next parish, but still at no great distance from this school, is another parochial school, in Summer-street, and attached to a district church of St. George's parish. I came to the school between the hours of eleven and twelve on a Monday morning, but found that in the school-room a prayer-meeting was being held, and that the school work would not commence until that had ended. After a time the meeting dispersed, but no signs of school children appeared, except in a small room used as an infant school, which had not been used for the previous proceedings. The schoolmistress informed me that the number of children generally present was forty-two, of all ages between nine and fifteen or sixteen years, and that the instruction was Scriptural. All the children were free, but provided their own books. Here, also, ladies who lived in the neighbourhood visited and taught in the school.

231. About twenty children were collected in the infant school, but the number generally in attendance much larger. The police returned the attendance in the infant school as thirty-seven, and in the other school the same number. All were Protestants, thirty-six of the whole number being members of the Established Church. I am unable to give any opinion as to the efficiency of the school, because, in the absence of the scholars, of course nothing could be done. I believe that it is usual in this school to give up the school-room on Monday mornings to the use of a prayer-meeting, thus giving an additional holiday in the week to the scholars.

232. There are several other schools of this class in the same parish, but I did not think it necessary to visit them, as these schools already mentioned were described to me by the Inspector of the Church Education Society as very good representatives of the system. The multiplication of these small schools does not tend to render them more efficient; but whilst the school is considered a necessary appendage to the Church it is improbable that any combination of the separate establishments will take place.

Schools in the western part of the district.

233. In the parish of St. Mary, which contains the nearest portion of the district of north Dublin on the western side of the Sackville-street line, the National schools are more numerous. The large King's Inns-street convent schools are on the western side of this parish; and there is a National school for girls and infants in Wellington-place, under the superintendence of Sisters of Charity, who give religious instruction, but leave the secular work to the regularly-classed teachers and monitresses. There is a school for boys only, in Denmark-street, under the management of the Very Rev. R. A. White, D.D., and a school in Bolton-street, with separate departments for boys and girls, under the management of the minister of the Presbyterian church on Ormond-quay. It seems, at first, that more school accommodation is provided for girls than for boys, and, doubtless, to a certain extent this is the case; but the girls who attend the first of these schools come from a large district of which this parish forms but a small portion; and in the adjoining parish of St. Michan there is more provision for boys, which relieves this parish. On the whole, in the two parishes together the schools for boys and girls are of nearly equal size, and there is no great preponderance in the number of scholars of either sex.

234. There are two schools, besides private schools, in this parish not in connexion with the National Board, both of them of the class known as parochial. One of these, in Mountjoy-street, is in connexion with the Church Education Society and is in no way remarkable; the other, the St. Mary's parochial school, properly so called, is under the management of a board of local trustees, as the school possesses considerable endowments.

Denmark-st. National school.

235. The Denmark-street National school is held in a building which was formerly the Dominican Church, and which has been adapted to its present purpose by the removal of the fittings of the church and the introduction of a number of desks, &c., sufficient for the use of 150 or 200 scholars. The room is, of course, very much too large, and appears to be in a very dilapidated condition. Whilst I was in Dublin, however, I heard that steps had been taken to collect the necessary funds to make the alterations and improvements which are required. The number of children present on the day of my visit was 152; the number returned by the police 159, all Roman Catholics. Only fifteen per cent. of the scholars had reached the third class, and the greater part of the remainder was included in sections of the first class. The reasons that were given for the very backward state of the children were, as usual, the extreme irregularity of attendance and the early age at which the children ceased to attend school. Most of the children were evidently exceedingly poor; they certainly wanted clothes and looked as if they wanted food. I examined the second, third, and fourth classes, in reading, writing, and arithmetic. The reading was fair, but the writing was poor and the spelling bad. The scholars, except those in the fourth class, did not come up to the standard required by the programme in arithmetic, and were very incorrect in their work.

Teaching staff.

236. The teaching staff consisted of the principal teacher, one assistant, and two monitors. The principal teacher was in the first division of the second class, but had not been trained. His salary was made up of the stipend paid by the National Board and the school fees, and no residence was provided for him. He told me that many children remained at the school long enough to learn to read a little and were then sent to the Christian Brothers; and that if a boy seemed at all promising his parents most frequently took him away in order to send him to the Christian Brothers. The poorest children who were least regular and made but little progress, remained at this school.

Bolton-street National school. Error in the police return with regard to the school.

237. The Presbyterian national school, in Bolton-street, is a very different kind of school. A large room on the ground floor of a private house, and another of the same size, underneath the former, are used for the boys' and girls' schools, respectively. The upper room is very lofty and well lighted, but wants ventilation; the lower room differs from it in every respect, except the last, but is only temporarily used as a school-room. The furniture of both rooms is sufficient, and in excellent order. In the boys' school the number present was forty-one, in the girls' school thirty-one, all of them Protestants. The scholars in both schools had attained more than the average proficiency in the subjects usually taught in the school, and a large proportion of them had reached the higher classes. No child in either school showed any of the outward signs of poverty, and I was told that of necessity all of them paid the school fees, and not always on the lowest scale. In the boys' school the teacher had no assistant nor monitor. In the girls' school a work-mistress was employed to assist the teacher. Both teachers had been appointed in 1868, had been trained at the model school, and were in the second division of the first class. Their salaries were made up of the stipend paid by the National Board, the school fees, and share of an endowment belonging to the school. This endowment is now worth £73 annually; the teachers receive £30 of this sum, and the rest is spent in house-rent and other such expenses.

Josephian National School.

238. The national school for girls, called the Josephian school, is under the superintendence of Sisters of Charity. The school formerly contained no separate department for infants, but not very long before the time of my visit the Sisters had found it desirable to make a change. The girls' school-room was a long low narrow room, affording accommodation for 125 children, but seemed to be very much crowded when only 106 were present. The furniture was sufficient, and as is usual in schools of this class, had some pretensions to elegance as well as use.

239. About 23 per cent. of the number of children were in the higher classes, but the scholars did not come up to the standard required by the programme; the failure was most remarkable in arithmetic. The girls in the fourth class knew nothing beyond compound multiplication; the girls in the third class were nearly as far advanced, though some of them were ignorant of the compound rules. Writing was taught with more success, the spelling was very fair, and the children read with remarkable fluency and intelligence. The secular instruction was given by a teacher who was in the first division of the third class, and two monitresses; but the religious instruction was given by one of the Sisters. The teacher received the stipend from the Board to which her class entitled her, and was not paid at the same rate as a monitress in a convent school.

Josephian infant school.

240. The infant school had been in operation a very short time, and no permanent arrangement had been made for it. The room seemed to be very small for the number of children, but I understood that it was only used for a time until better provision could be made. The number of children in the infant school was 75; the teaching staff the same as in the other school, one classed teacher and two monitresses. In neither school did the children appear to be so destitute as many of the

boys in the Denmark-street school, but it is possible that the Sisters may clothe or feed some of the poorest. All the children on the school roll were Roman Catholics.

Mountjoy-st. Scriptural school; no return of the number of scholars made by the police.

241. Close to this school stands the Mountjoy-street Scriptural School. This school, which, as its name indicates, is not in connexion with the National Board, contains separate departments for boys, girls, and infants. The buildings were exceedingly good, the two rooms which I saw were large and airy, and properly supplied with school furniture. The number of boys present at my visit was 19, all Protestants; the police were unable to make a return with respect to these schools, because an examination was being held on the day of their visit.

242. I examined the highest class in the school in reading, writing from dictation, and arithmetic. The boys read well and wrote fairly, but their spelling was disgracefully bad, and their knowledge of arithmetic very limited and imperfect; one boy had learnt proportion, but two-thirds of the rest did not succeed in working a sum of compound addition correctly. As this class contained more than half the boys who were present, it would seem that the school was not very efficient. It must, however, be remembered that the vacation had ended only two days before my visit, and that the failure of the scholars may be partly explained by this fact. Still a comparison of this school with National schools which I visited under the same disadvantages is much in favour of the National schools. A considerable portion of each day—an hour and a half out of the five nominal school hours—is assigned to religious instruction; the time spent in this way appears to be somewhat excessive. The number present in the girls' school was 22, all Protestants also, though one Roman Catholic was entered on the school rolls. The school, as regards efficiency, was much on a par with the last, the only difference being that the girls gave much more trouble by copying from each other at every opportunity. The infant school I was unable to visit.

243. The teacher of the boys' school received £40 annually and the school fees, but no residence was provided for him. The teacher of the girls' school received £25 and the school fees, and lived at the school.

St. Mary's parochial school.

244. St. Mary's Parochial School contains separate departments for boys, girls, and infants, and a boarding establishment for boys. The school is held in a large private house in Lower Dominick-street. The rooms were large and well lighted, but as all the windows were closed the want of ventilation was very strongly felt. The boys' school-room was very large, and had been formerly divided into two parts by folding-doors, which were now removed; the boys were, however, all collected in the same part of the room. The desks were sufficient for the number of boys present, and well arranged, and the boys were supplied with school books. The number present was 41, all of them members of the Established Church. The boys in the highest class wrote for me a life of the Duke of Wellington; the grammar and orthography of their compositions were tolerably correct, but the matter was ridiculous. The boys in the next class wrote well from dictation, and were fairly correct in their spelling. Arithmetic appeared to have been learnt in a more rational manner than in any other school which I saw, the boys appeared to understand the reasons for the processes they adopted, and were able to work out sums which were not direct examples of any rule in particular.

245. The girls' school, though not equal to the boys', was much superior to the ordinary parochial schools. The girls wrote well, but were backward and incorrect in arithmetic, none of them knew anything more than the four elementary rules, simple and compound, and these but imperfectly. The number present was 33, all members of the Established Church; the number returned by the police was 27.

246. The infant school-room was detached from the house, and the space between the buildings was used as a play-ground. The number of children in the school was 65, but the room could accommodate a much larger number; the number returned by the police was 87, and that number is, I believe, a fair representation of the average attendance. Bread was given daily to every child in this school, a very common practice in parochial schools.

School supported by endowments, and contains an establishment for boarders.

247. The school is supported partly by endowments, which produce at present about £100, and partly by voluntary subscriptions which amount to £150. As many boys as the funds will maintain are boarded gratuitously, but as there is still room for more, other boarders are taken whose friends pay £13 annually for them; the payments on this account amounted to £50 in 1867. The children in the day school pay 1*d.* per week, almost without exception, and from this source £15 4*s.* were received in the same year. The school is not in connexion with the Church Education Society, but is managed by a board composed of the rector, curates, church and chapel wardens of St. Mary's parish, and twelve of the leading parishioners, who are subscribers to the school.

St. Michan's parish.

248. In St. Michan's parish there are three large schools, the George's-hill National Convent School, St. Michan's National School, and a Christian Brothers' school; these are attended by Roman Catholics exclusively. There is one parochial school at which the numbers in attendance are not large, and this is the only school which contains any Protestant children.

National school.

249. St. Michan's National school is a very large establishment, with five separate departments, two schools for boys, one for girls, and two for infants, one of the infant schools is an addition to the St. Michan's school made when a ragged school, situated not very far from the National school in Linenhall-street, was given up.

North Anne-st. infant school.

250. The situation of the school, in a narrow dirty street, is very bad, and the buildings are wretched. They consist of one large house, which seems to have been a private dwelling formerly, and a smaller building which contains a single school-room attached to the former building but under a separate roof. In this detached room, which according to the regulations of the National Board, should not contain more than 80 children, 105 infants were collected on the day of my visit. The room was lighted from the roof, and the windows and doors being open, the current of air thus created rendered the atmosphere tolerable, but the state of this school in wet or cold weather must be terribly unhealthy. The crowding was not extraordinary; the police found 97 children in the school. All the children were Roman Catholics, as were the children in all the schools collected here. The school-mistress who was in the second division of the second class was paid £24 by the National Board, and £10 by the manager who took the school fees. There were two classed assistant teachers, but no monitresses, so that the teaching staff was large.

251. This infant school was an addition to the system of schools already complete, as I mentioned; the rest of the schools were lodged in the main building. There was not a room in the house fit for its use; the best was the higher boys' school which was at the top of the building, and had more windows than any other, and in it the state of the atmosphere was bad. In the rooms on the first floor and the ground floor the dirt, darkness, and foul air made a stay of a few minutes almost unendurable. The infant school, which was on the ground floor, was the worst of the whole; it could hold nominally 105 children, but 123 were actually present at my visit, and 120 were found there by the police. There were three teachers to look after these children, the principal teacher was in second division of the third class, and had been trained at the model school. Her annual salary was £26 including the manager's contribution of £10. St. Michan's infant school.

252. Above this school was an intermediate school for boys, held in the largest room in the building. The number in the room was only 80, but there was space for 135; notwithstanding the absence of crowding in this room the want of light and air was very sensible, and the children looked exceedingly dirty and unhealthy. The school was a great contrast to the other school of the same class at the St. Patrick's national schools which I have already described. The two teachers of this school were men, the principal teacher was in the first division of the third class, and received £36 annually including £12 from the manager. The boys in this school were all in the first class. As soon as they could read the First Book with ease, that is, as soon as they could read words of one syllable they were sent up to the higher school. Boys' school, No. 2.

253. The higher school-room was not so large as the last, but in it also there was some unoccupied space. It could hold 121, and the number present was only 78; if the room had been full the atmosphere, which was only just tolerable, would have been as bad as in the infant school. Rather more than half the boys in the room were in the second class, and the proportion of boys who manage to enter the higher classes before they cease their attendance at school is, I was told, small. The boys in the fourth class wrote well, and worked sums in arithmetic readily and correctly, and so far the school seemed to be efficient, but the disadvantage of working in such a place must be a great hindrance to the efforts of the most efficient teacher. In this school as in the others, the number of classed teachers was two, but here were two monitors in addition. The principal teacher was in the first division of the second class, and had been trained at the model school. His annual salary from the National Board was £36, and from the manager £20. Boys' school, No. 1.

254. The only girls' school was the smallest of the whole system. The room could hold 85 children; the number present was only 40. The small attendance was caused by the neighbourhood of King's Inns-street and George's-hill Convent Schools, which attracted most of the children in this parish. The schoolmistress told me that the children who came to this school were exceedingly irregular, and very often entirely ignorant. Notwithstanding the small number of scholars an assistant teacher was employed. She had not been actually appointed, but was waiting for the Inspector's approval. The principal teacher was in the first division of the second class, and had been trained. Her salary from the National Board was £26, and the manager instead of making a fixed payment, as in the other schools, allowed her to take the school-fees, which only amounted to £2 19*s.* 1*d.* last year. Girls' school.

255. In all except the infants' departments of this school the number of scholars present has been less than the school-rooms would accommodate, and therefore it may be thought that in this neighbourhood there is no need of additional schools. It should, however, be remembered that these rooms were hardly tolerable in their present half filled state, and that any increase in the number of scholars would render some great alterations absolutely necessary. The salaries of the teachers are remarkably low. The most highly paid teacher receives but £52, and none of the rest receives as much as £40. Out of this sum a residence has to be provided, and it cannot be thought surprising that the teachers should complain of the narrowness of their circumstances. The school accommodation bad.

256. St. Michan's parochial school is in a better situation, and has much better buildings than the national school. The rooms were large and airy, and in excellent repair, and the furniture was excellent. The number of children was far less than that which the room could contain. In the boys' school 18 scholars were present, in the girls' school the same number, and in the infant school 36. All the children were Protestants, most of them members of the Established Church. The police found 26 boys, of whom one was a Roman Catholic, 25 girls, and 36 infants. The teachers were provided with residences, the schoolmaster received £75 annually, including his salary as parish clerk; the schoolmistress of the girls' school £40, and the infant schoolmistress £25. St. Michan's parochial.

257. The Christian Brothers' school I did not visit, as that class of schools was not included within the limits of my inquiry in Dublin.

258. The rest of North Dublin is included in the parish of St. Paul, and a part of Grangegorman. In St. Paul's parish there is a large National school under the management of the parish priest; a very small school attached to the Wesleyan Chapel in Blackhall-place, also under the National Board; and a National school for boys only, in North Brunswick-street; besides these there is a parochial school, and the charity school in Blackhall-place, which is not noticed by the police; it is not a primary school, but as the police have included every kind of school in their return, the omission of one so important is unintelligible. There are several small private schools in the parish, supported by the payments of pupils. St. Paul's parish.

259. In the parish of Grangegorman there are two large national schools, one in Manor-street for girls and infants, under the superintendence of Sisters of Charity, the other beyond the limits of the city at Phibsborough; there is no parochial school in this part of the parish, and only a few private schools. In the parish of St. Paul the schools for boys are more numerous than those for girls, but in Grangegorman the reverse is the case, and the whole district is supplied with both kinds of schools equally. Grangegorman parish.

260. St. Paul's national schools in many respects resemble the St. Michan's schools, and with slight alterations the same account will apply to both schools. The situation is better, but the buildings which consist of two private houses, are thoroughly unfit for their present use. None of the rooms were filled, and two, the second boys' school-room, and the second girls' school-room, were not more than half full, yet the atmosphere in many crowded rooms was less unhealthy than in these. However, as new buildings were in progress of construction the defects of the present schools are of less im- St. Paul's national schools.

portance. There are five departments, two for boys, two for girls, and one for infants. The second school for boys and girls includes all children not able to read in the First Book, and the number of children in these schools is about two-fifths of the whole number. The number of those who reach the higher classes is but small, and most of the children leave this school while they are only in the second class. The girls, I was told, remained at school a shorter time, and were more irregular than the boys.

261. The salaries of the teachers were considerably higher at these schools than at St. Michan's. The teachers were of a higher grade, and to some of them the manager gave a considerable gratuity in addition to the school-fees. I examined the highest class in the boys' and girls' schools, and to judge from the proficiency shown the school must be efficiently conducted.

262. During a part of the year an evening school for boys, or rather young men, is held here by the master of the boys' school; it was not in operation at the time of my visit, so that I had no opportunity of estimating its usefulness.

263. All the children in the school were Roman Catholics, and most of them very poor, but they did not present the same appearance of destitution as was so strongly visible at St. Michan's and the Denmark-street schools. The neighbourhood of this school is apparently inhabited by persons in a more prosperous condition.

264. The North Brunswick national school is attended by Roman Catholics only, according to the returns of the police, but I did not visit the school.

Blackhall-place national school.

265. The national school in Blackhall-place is held in a vault under the Wesleyan chapel. It so far satisfies the conditions required by the Commissioners, that there is no internal communication with the chapel above, but the transition from the school to the chapel is the shortest possible, merely an ordinary flight of area stairs. The room is very long and low, but is fairly lighted, and as the children occupy only one end of it, the air is by no means oppressive. The room affords space for 128 children, but the number present at my visit was 22; the number returned by the police was 44, which was much nearer to the average attendance recorded in the report-book of the school. Both boys and girls attend the school, but they do not complete their education in it. The schoolmistress told me that nearly all of them went elsewhere to be "finished." No scholars had reached the fourth class, but seven were in the third class. I examined them and the children in the second class, in the usual subjects. All the children were backward in arithmetic; the children in the second class could not do more than add, and not all of those in the third class knew the four compound rules. The writing and spelling in both classes were good.

Teaching staff Wesleyan.

266. The schoolmistress was in the first division of the third class, and had been trained in the model schools. Her salary was derived from the stipend paid by the National Board, and from the school-fees, and amounted in 1867 to £45 9*s.* 8*d.*, but no residence was provided for her. She had one female assistant teacher, but no monitors or monitresses. She and her assistant were Wesleyans; the pupils were of various religions. The number on the roll was 53; of these, 22 were members of the Established Church, one was a Roman Catholic, and the rest belonged to different Protestant bodies, but were chiefly Wesleyans.

St. Paul's Parochial school.

267. St. Paul's parochial school is a very small establishment. It is held in a house close to the church; the boys' school in one room, and the girls' school, which serves also as an infant school, in another. Only 12 boys were present on the day of my visit, and 27 girls and infants. I did not examine the children at all, so that I cannot say whether the school is efficiently conducted or not, but its appearance is unfavourable. The master was parish clerk, and received £50 annually and a residence. The schoolmistress received £22 10*s.*

School unnecessary.

268. The school is entirely dependent on voluntary aid, and I understood from the rector that there was considerable difficulty in collecting sufficient funds to support the school, and that probably one great source of income would cease to be productive, so that the prospects of the school are not promising. If the school were discontinued, the loss would not be irreparable. At St. Michan's parochial school there is room for many more scholars than those who attend this school, and the same sort of instruction is given. These schools are instances of the unnecessary multiplication of parochial schools. If both were united, the result would be a very small school, and at present the expense of separate buildings and additional teachers is incurred with no corresponding advantage, except to the teachers who are paid for doing very little work.

269. The two schools in the parish of Grangegorman are both national schools. The Manor-street school is within the limits of the city, but not far from the outskirts: the Phibsborough school is suburban.

Manor-street National school.

270. The school in Manor-street has been established only one year, yet, already the number of children in attendance was 145 in the girls' school, and 150 in the infant school, and the numbers returned by the police were not much less—139 and 135 respectively—so that the need of a school in the district must have been great. The school is an offshoot from the King's Inns-street Convent School, and many of the children had formerly attended that school. The religious instruction in this school is given by Sisters of Charity, and they exercise a general supervision in the school, but take no part in the secular instruction. For this purpose there are teachers regularly classed, and paid by the National Board.

Infant school.

271. The rooms are exceedingly good, they are well lighted and ventilated, supplied with excellent furniture. The only objection that can be made to them is, that the separation between the two rooms is so slight that the noise from the infant school causes great inconvenience in the other. The accommodation afforded by the rooms is quite insufficient for the number of children attending the school; the infant school-room ought not to hold more than 105, the girls' school not more than 112, yet the numbers crowded into them are much larger. The Sister in charge of the school told me that the number of children was too large, but that they could not be sent away, and the crowding was relieved as much as possible by sending out the classes for recreation at different times.

272. The children in the infant school seemed to be very well looked after; many of them were very ragged, but they were all neat and clean. Throughout my examination of schools I think I could always notice a difference in this respect, in the appearance of children in schools where the buildings were bad, and the rooms dirty and ill-constructed, and in schools like this, where the buildings leave nothing to be desired.

273. In the girls' school the proportion of scholars in the higher classes was very large, and many of them were above thirteen years of age. They wrote well and their spelling was very fair, in arithmetic they were backward, but their work was unusually correct. Most of them had already been at school elsewhere, the greater number at the King's Inns-street school, and had migrated to this school when it was established. Girls' school.

274. The teaching staff in this and the infant school was the same. In each the chief teacher was in the first division of the third class, and was assisted by two classed teachers and three paid monitresses. Thus there was a teacher and a monitress for forty-nine children in the girls' school, and for fifty in the infants' school.

275. The Phibsborough school was a large establishment with four departments, two for boys, one for girls, and one for infants, formerly the girls' school had been divided into two, but the numbers now in attendance were not sufficient to render the division necessary. The opening of the Manor-street school, which I have just described, had lessened the attendance here considerably. The school is vested in trustees, so that the National Board contributed to the erection of the school-house. The buildings are new and very good; the only fault that can be found with them is, that sufficient provision for ventilation has not been made, and the debased perpendicular style which the architect adopted has caused the windows to be badly placed, and filled with ugly tracery which succeeds in excluding the light. This causes the room on the ground floor to be very dark, on the higher floor the effect is not so sensible. Phibsborough school. Good buildings.

276. The two school-rooms for boys occupy the ground floor, they are separated by a wooden partition only. The larger room contains space for 96 boys, and is used for the higher school; the number actually present at my visit was 53. The other room affords space for 51 boys, and actually contained 36, thus, there is accommodation for 147 boys, and the number present was 89; this number is much less than that returned by the police, viz. 141, but my visit followed the end of the vacation very closely, and the police return is, I believe, a fairer representation of the average attendance. Boys' schools.

277. The boys in the third and fourth classes wrote well, and were able to spell very correctly, and in this point were much superior to the boys in most schools of the same class. Their arithmetical work was good, and as far advanced as the programme requires. The furniture was sufficient, and in excellent order, the boys were well supplied with books, and the school seemed to be conducted most efficiently. The master had one assistant and two monitors; he was in the second division of the first class, and had been trained at the model schools. His salary from the National Board was £59 10*s*., and the manager paid him £20 instead of the school-fees, no residence was provided for him.

278. The second boys' school is for little boys who are reading in the First Book only, the boys in the highest division read their book with ease, copied sentences from it on their slates, and could add four columns of figures correctly. There was only one classed teacher, but he was assisted by two paid monitors. The teacher was in the first division of the second class, and had been trained; his salary from the National Board was £32, and the manager paid him £16 instead of school-fees.

279. On the first floor are two rooms, both of which were formerly used as the school-rooms for girls, but at present one is found to be sufficient. Adequate accommodation is provided for 165 girls. The number present at my visit was 52, and the number returned by the police, 70. This was also a very good school, but the girls were not equal to the boys in the other department. In arithmetic, their inferiority was most marked; they were backward and incorrect in their work. Still their proficiency was above the average. The schoolmistress had just been appointed; she was in the first division of the third class, and had been trained in the model schools. Her salary from the National Board was £20, and she received £8 from the manager. There was one classed assistant teacher, besides two monitresses. Girls' school.

280. The infant school was on the second floor at the top of the building, a considerable height for some of the smaller children to ascend. It was the brightest and most airy room in the building, and afforded space for 128 children. The number actually present in it was 78, the number returned by the police was 105. The children were clean and neat, and seemed to be in very good hands. There were more teachers here than in any other of the schools. Besides the principal teacher, there were two assistant teachers and two monitresses. The chief teacher was in the first division of the second class, and had been trained. Her salary from the National Board was £26, and she received £10 from the manager, but no residence was provided for her. All the children in these schools were Roman Catholics, and though they were all of the poorer class, did not show any of these signs of extreme destitution which I had noticed in the schools in the more central districts of the city. This was one of the best schools that I saw, and the causes of its excellence are not difficult to find. The buildings are good, the teachers efficient, and the manager interests himself actively in the welfare of the school. Infant school.

281. My account of the schools which I visited in North Dublin is now complete. It is, I hope, a fair representation of the state and efficiency of two great classes of the schools which educate the children of the poor. The question as to the sufficiency of the schools for the wants of the population has already been discussed, so far at least as relates to the amount of accommodation afforded. The advantage derived from attendance in the schools, and the extent to which the existing means could supply the wants of an increased number of scholars may now be considered. On the first point it appears to me that the elements of secular knowledge are taught thoroughly in the National schools, and fairly in the parochial; but in the former, the efficiency of the schools is very much lessened by the wretched buildings which are used as school-rooms. The difference in the proficiency of children in well and ill-built rooms is very striking; probably the manager who provides a good school-room provides a good teacher also; but this cause is not the only one. The foul air and the dirt make the teachers' work more difficult, and the children less able to learn. With regard to the second point, though the existing schools are not used to their fullest extent in all cases, yet a very slight increase in the number of children would fill the schools to repletion, and if any provision is to be made for the large number of children now habitually absent from school, the present schools will be found insufficient. On both these points, however, the information which I have given with respect to the schools which I have visited, will, I hope, enable any person to form a just opinion, and I think it unnecessary further to obtrude my own. Schools on the whole efficient, but then buildings require alteration.

PART II.

Section IV.—3. Schools in South Dublin.

South Dublin.

282. The district of South Dublin may be divided into three portions, of which the characteristics are marked by considerable differences; the central parts of the city, on the western side of Grafton-street, which include some of the poorest and most wretched districts in the city, and of which these districts are the distinguishing feature; the part of the city on the east of Grafton-street, which includes the most wealthy quarter of Dublin, and where, except in the neighbourhood of the docks, comparatively little poverty exists among the inhabitants; and the suburbs which surround the city, from Inchicore to Ringsend.

Western district generally poor.

283. Of the first of these districts the part near Grafton-street is intersected by busy streets, which have every appearance of prosperity, and where no traces of poor inhabitants are to be observed. In the neighbourhood of St. Patrick's the district changes its character completely, and becomes a network of filthy lanes and courts, intersected by a few large streets. The Liberties and the many streets in the neighbourhood of the quays and on each side of the main artery of James's-street are almost entirely inhabited by persons who are apparently in a state of great destitution. My observation agrees with the information which I received from persons living in the district. They said that poverty, drunkenness, and vice prevailed to a great extent. In such places it may be imagined that education does not prosper. The schools are attended with extreme irregularity, and the proficiency of the scholars is much below the standard reached in schools situated in more favourable circumstances.

Incorporated Society's school, Aungier-street.

284. In the better portions of the district there are no primary schools. I visited a school, partly maintained by the Incorporated Society, in Aungier-street, but the master informed me that elementary instruction was not given in the school, but that classics, mathematics, science, and other branches of a general and commercial education formed the curriculum of the establishment.

Whitefriar's-street national school.

285. Not far from this school, in Whitefriar-street, there is a large national school under the management of the Very Rev. Dr. Spratt. The school contains four separate departments—two for boys, one for girls, and one for infants. The boys' schools are on one side of the street and the girls' and infants' on the other. The buildings of both schools, but especially the former, are exceedingly bad. The boys' schools occupy two large rooms, one above the other, both of which are as unsuitable for their purpose as they can be. Each affords accommodation for 169 pupils, and though the number present fell considerably short of this, yet the state of the rooms was almost unendurable. I remained in the upper room, which is used by all the boys above the first class, long enough to examine the boys in the third class and part of the second class. The number present was 64, and a large part of the room was unoccupied, yet the want of ventilation, and the foul air ascending from the room below rendered the atmosphere so unhealthy that I was forced to hurry through my examination with all speed and make my escape into the street. The boys wrote fairly, but were backward in arithmetic and very slow and incorrect in their work. The teaching staff was inadequate; the master had neither assistant nor monitors and it is not surprising that the boys showed the want of efficient instruction. The master had been trained at the model schools and was in the second division of the second class. His salary from the National Board was £28, and from school-fees he received £5 1*s.* 1*d.* in the year 1867. He received a small sum for superintending a drawing class during the hours preceding the commencement of the daily school work. In order to increase the attendance in his school he had admitted lately some boys who were unable to enter the second class and who should have attended the lower school.

Boys' schools.

286. In the lower school 114 children were present, all in the first class, and with very few exceptions under ten years of age. This room was quite as bad as the other as regards ventilation, and had the additional fault of being extremely dark. The master had been trained in the model school, was in the third division of the first class; he had a classed assistant teacher, but no monitors; no boys fit for the office could be found. The master's salary from the National Board was £38, and from school-fees £8. These schools are mentioned unfavourably in the report of the Endowed Schools Commission; the same remarks which were made about them there might be repeated on the present occasion.

Girls' and infants' schools.

287. The girls' and infants' schools are held in a large building which was formerly a Methodist chapel. On the ground-floor the desks for the girls' school are placed, and in a gallery which surrounds three sides of the building, the infants are collected. The windows are large and numerous and when they are open the ventilation is better than usual. The room is far too large and very inconvenient, but is very much better than either of the boys' schools. The number of girls present was 114, the number for which there was room 225. This school was not more efficient than the boys' school. The girls were unusually ignorant of arithmetic, and wrote badly. The same cause cannot be assigned for the low standard of proficiency attained by the children; for in this school, besides the principal teacher, were two classed assistants and three monitresses. The children did not belong to the poorest class, as all except ten paid the school-fees with regularity, but they were most of them very young.

288. In the infant school there was room for 290 children, and 260 were present. Four classed teachers and two monitresses conducted the school; the principal teacher had been trained and was in the third division of the first class. The school-fees in this and in the girls' school were paid to the manager who distributed them among the teachers. The teacher of the infant school received £30 from the National Board, and £10 from the manager; one teacher of the girls' school received £26 from the National Board and £16 from the manager.

These schools mentioned in the Report of the Endowed Schools Commission.

289. These departments of the school had also been inspected by the Endowed Schools Commission, and the remarks made in the report are applicable to the present condition of the school. Many deficiencies were then pointed out but nothing has been done to supply them, and the school is now by no means so efficient as it should be.

St. Bride's national school attended by Protestants and Roman Catholics.

290. In the same parish, and at no very great distance from this school, there is another national school of which the manager is the rector of St. Bride's. This school, I was told was the most remarkable instance of the success of the National system in educating children of both religions together. If this be the case the success is not great; on the roll of the boys' school were 30 scholars, of whom 5 were Roman Catholics, the rest members of the Established Church; on the roll of the girls' school 40 scholars, of whom 7 were Roman Catholics, and out of 96 infants present in the school 5 were

Roman Catholics. On the day of their visit the police found 14 Protestants and 4 Roman Catholics in the boys' school, 15 Protestants and 6 Roman Catholics in the girls' school, 50 Protestants and 15 Roman Catholics in the infant school.

291. The two schools are held in the same room, a curtain being the only separation between them: the available space is three times as much as is required for the number in attendance, and the room is very airy and light. The boys were young and backward, especially in arithmetic; the girls were older, but not more proficient. The schoolmaster had been appointed only two months before my visit. He was trained in the model school and was in the first division of the third class; his salary from the National Board was £24, from the manager £36 and a residence rent free, was provided for him. The schoolmistress was appointed in 1843, and had been trained at the Church Education Society's school in Kildare-place; she had never been classed under the National Board and received a probationer's salary, only £14, the manager gave her £20, but no residence was provided.

292. The infant school-room is a new addition to the school buildings, but is in every way inferior to the rest. The room is small, dark, and utterly without ventilation; it affords accommodation for 56 children, but 96 were crowded into it on the day of my visit. All of them except 3, who were Roman Catholics, were members of the Established Church; the police found only 65 children in attendance, but of these 15 were Roman Catholics. The teacher had been trained in the model schools, and was in the first division of the third class; her salary paid by the National Board was £26, by the manager £10, and she had a residence. There was a classed assistant teacher, but no monitress. All the teachers were members of the Established Church, and as no Roman Catholic clergyman or other qualified person exercised the right which he possessed of giving religious instruction to children of his creed at convenient times, these children received secular instruction only. The teachers told me that no Roman Catholic would be permitted to visit the school for the purpose of instructing the children in religion, but they were probably ignorant that the school, being vested in trustees, the regulations of the National Board required that free access should be allowed to fit persons approved of by the parents as instructors in religion. Infant school.

293. This school possessed unusually large local support from endowment and collections. From the first source £122 were received in 1866, from the proceeds of a charity sermon £48 5*s.* 10*d.*, and from private subscription £11, altogether £181 5*s.* 10*d.*; the school-fees in the same year amounted to £3 11*s.* 3*d.*, and were added to the general fund. The portion of this sum expended in increasing the teachers' salaries amounted to £75, the aid received from the National Board amounted to £76, the average daily attendance was 105, thus the total expenditure per head was £1 8*s.* 9*d.*, and the local contribution 14*s.* 9*d.* The value of the teachers' residences is not included in this calculation, nor is any account taken of the large portion of the sum raised in the locality which is devoted to other purposes than the increase of the teachers' salaries. Large support from local source.

294. Not far from these schools, but farther to the west and in poorer districts of the city, are situated the national schools attached to the Roman Catholic churches of SS. Michael and John, St. Audoen, and St. Nicholas, besides several parochial or quasi-parochial schools.

295. SS. Michael and John's school is near the river, in a very crowded and dirty neighbourhood; the girls' and infant schools are held in an old building which was formerly a merchant's dwelling and warehouse; the boys' school is at a short distance and possesses new and excellent buildings, erected expressly for the purpose. New schools for the girls were nearly ready, so that the existing unsatisfactory accommodation is likely to be soon much improved. Close to the girls' and infants' schools is a large bacon factory, besides other establishments which poison the air by the stenches emitted from them. The girls' schools are two in number, one for scholars in the first class only, the other for the more advanced scholars. The rooms were exactly alike, occupying the first and second floors of the warehouse; each was large enough to accommodate 154 children, but the numbers present were 55 in the higher school, and 61 in the lower. Though so large a portion of the available space was unused, yet in consequence of the absence of any means of ventilation, except by the windows, and the impossibility of admitting a current of pure air even by these, the state of the school-rooms was such as to render a prolonged inspection of the schools impossible. The teachers complained very much of the difficulty they experienced in conducting the schools in a place so unfit for the purpose; one of them who had not been there two years, and who had previously been employed in the country, said that her health had suffered so much that she should soon be compelled to leave her post. The children also seemed to be oppressed by the unhealthy atmosphere in which they were living, and the schools, as far as I could judge from appearance, were in a state of torpid inefficiency; nothing better, however, could be expected under such circumstances. As I have already mentioned new buildings are nearly ready, in a better situation and constructed with care; but I have thought that it was necessary to draw attention to the existing school arrangements, in order to point out by an example the great deficiencies in the school accommodation which have been, and elsewhere are, allowed to remain apparently unnoticed, except by a paragraph in the report of the Inspector. SS. Michael and John's national schools. Wretched situation of the girls' schools.

296. In the higher school 55 children, out of 106 on the roll, were present; in the lower school 61 out of 116, all of them Roman Catholics. The teacher of the higher school, who had been trained at the model school and was in the second division of the first class, was assisted by a monitress only; the teacher in the lower school, who had also been trained and whose grade was the second division of the second class, was assisted by another classed teacher. The school-fees from both schools were paid to the manager, who gave the two teachers £10 and £11 respectively every year. Although neither schoolmistress had any interest in attracting a large number of scholars to their schools, yet the teacher of the higher school said that a number of children were detained in the lower school when they were fully qualified to join the other. At the time of my visit 23 girls in the lower school were reading the Second Book who, if the scheme for the arrangement of the schools had been strictly followed, would have been promoted to the higher school.

297. The infant school was held in a large room at the top of the dwelling-house; the height to which it was raised above the surrounding buildings was such as to render the atmosphere tolerably pure, and, though the room was crowded to excess, yet it was far less unhealthy than either of those already mentioned. The number of children present was 202 out of 343 on the roll; the accommodation was sufficient for 189 children only. Most of the children were collected in the large room, but Infant school badly conducted.

a number of the younger children were shut up in a small class-room, which had been made by raising a division near one end of the large room. These babies, for many of them are best described by the name, were left in charge of a little girl four or five years old. The room was very small, the window was shut, and the day exceedingly hot; on entering this room from the other the shock to the senses was almost overwhelming, and I understood that it was usual to put the little children day after day in this black hole, because there was no place for them elsewhere. Besides the principal teacher, four classed assistant teachers were engaged in the school, yet the children who required at least as much care as those who were older and stronger were left with a child herself too young for any but an infant school. It is almost incredible that such a state of things should have been allowed to exist unnoticed; if want of space be pleaded as an excuse, it may be hoped that the removal of the school will cause improvement, but for the neglect on the part of the teachers nothing can be said.

Boys' schools; good buildings, but bad situation.

298. The boys' school is at a small distance from the other in a narrow street with an opening on the quays which would in a great measure neutralize the bad effects of the confined situation of the school if the river bed did not, except at high water, emit most nauseous exhalations. The school buildings have been erected by the present manager, the parish priest, on freehold ground which he had purchased. They are, without exception, the best schools which I saw; every care had been taken to make the buildings suitable for the purpose, and to maintain them in proper order. The rooms are large and lofty, and exceedingly well ventilated; they are abundantly supplied with excellent school furniture, and are kept scrupulously clean. Though the space on which the building was erected was very limited, nothing offensive to the senses could be noticed.

299. The building contained two rooms, one on the ground floor, the other on the floor above; the higher room was rather larger than the other, and was used by the older boys; in the lower room all the scholars were in the first class. The number for which accommodation was provided was 227, the number actually present on the day of my visit 153, 20 more than the number returned by the police. The number on the roll was 276, all Roman Catholics. Rather more than one-fourth of the boys present had passed through the second class and entered the higher classes, but I was told by the teacher that the great majority of boys cease to attend school before they are fit to enter the third class. The highest class was the fourth and contained 9 boys, of whom not one was more than thirteen years of age. They wrote from dictation with unusual rapidity, and their handwriting and spelling were very good. All could work sums in proportion, and five of them worked a sum in practice correctly; some of the others who were ignorant of this rule, unprompted applied the principle of proportion to the same sum. These boys also showed a very fair acquaintance with the elements of geography, and answered my questions in the most intelligent manner. I examined half of the boys in the second class; they were able to read fairly in their lesson book, and write on their slates an easy sentence from dictation, but not one could write down correctly the names of the days of the week; about two-thirds of them could work sums in simple multiplication. The boys in this class were exceedingly irregular in their attendance, and this reason is sufficient to account for their inferiority when compared with the boys in the highest class; two or three of the younger boys, whose attendance was exceptionally regular, reached as high a standard in the subjects they had learned as any of the boys in the fourth class.

300. The head teacher in this room presided over the whole school, as the teacher of the lower school chose to be an assistant instead of the principal of a separate department; his choice was the more remarkable, because he thus voluntarily placed himself under the orders of younger and more recently appointed teachers. Besides these there were three other classed assistant teachers and one paid monitor, so that the teaching staff was quite sufficient for the wants of the school. The head teacher was in the third division of the first class, and had been trained in the model school. His salary amounted to £77 10*s.*, including £54 10*s.* class salary and good service pay from the National Board, and £23 from the manager. The last item included the school-fees and the remuneration which the manager gave him for holding an evening school and a Sunday school.

Evening school.

301. The evening school, contrary to the general rule, was in operation during the summer and I had an opportunity of visiting it. Forty-five pupils were present, of whom four were more than twenty years of age, but the greater number were between the ages of fifteen and twenty; a few of them were still younger and had quite recently ceased to attend day schools, two of them being less than eleven years old. With three exceptions, all the pupils had previously attended a day school for some time, yet some of them were learning to read, and many of them could scarcely write at all. The schools which were most largely represented were those of the Christian Brothers. Several of the pupils had in former years remained in the Christian Brothers' schools long enough to reach the third class, and had learnt to read well, but this was the whole extent of their knowledge; they had almost forgotten how to write, if they had ever known, and were very ignorant of arithmetic. This result confirms an opinion which I have stated on a previous page, that the system of the Christian Brothers is not remarkably successful in the case of those boys who leave school before they reach the highest class. Of the pupils present seventeen were doing the work prescribed in the programme for the fourth class. They wrote from dictation a passage which I had been accustomed to give in the day schools with much greater accuracy than the ordinary scholars, and though they were slow they succeeded in working correctly sums in practice and proportion; one of the best of them had never attended any other school, and had learnt everything he knew in this school. This class was the most satisfactory of the whole; in the lower classes many of the pupils failed in writing and arithmetic. The head teacher of the day school conducted this school without any assistance, and as the exceedingly quiet and orderly behaviour of the pupils allowed him to devote all his energy to actual teaching, the services of an assistant were not required.

Local support.

302. These schools possess a small endowment of which an account is given in the report of the Endowed Schools Commission, but the chief source of support is an annual charity sermon. By these means sufficient funds had been raised to buy the site, and to meet the expense of building new schools, both for boys and girls. The case is especially worthy of notice, because it shows how much can be done under favourable circumstances, by local effort. In other places as much money may have been raised for the maintenance of schools, but nowhere has so good a use been made of the available funds, and

this single instance of success of local efforts in providing efficient schools, shows only more clearly the general failure.

St. Audoen's national school.

303. St. Audoen's national school situated in a similar neighbourhood, and attended by children of the same class, presents a striking contrast to the last-mentioned school. It is held in a vault under the Roman Catholic church, which is built on a steep declivity. At one end of the church the floor is on the level of the top of the hill, at the other end in consequence of the steep slope there is space below the floor sufficient to make two large rooms. The rooms are very dark and damp, and in winter must be exceedingly cold, they are very dirty and ill ventilated. The boys' school is divided into two parts by a wooden partition, in the outer room the boys in the first class are placed, the rest in the inner room. There is accommodation for 234 scholars, but the number present on the day of my visit was 105, of whom 53 were in the lower school; the number returned by the police was 101. The rolls contained the names of 172 scholars, all of them Roman Catholics. I saw the school under somewhat unfavourable circumstances, as the principal teacher was absent, and the teacher of the lower school with the assistance of one monitor, was left in charge of both schools. The disorder which prevailed, rendered any satisfactory examination of the scholars difficult. Only ten had passed through the second class, and they fell short of the standard required for the higher class; the boys of the second class whom I examined were also inferior. The attendance was exceedingly irregular, and very few of the boys remained at school after they were eleven years old. The children seemed to be of the poorest class. The principal teacher had been trained in the model schools, and was in the first division of the second class, his salary amounted to £49 10*s.* 7*d.*, including £32 from the National Board, and £8 from the manager, and the school-fees.

Boys' school.

Girls' school.

304. The girls' school which was attended by a few little boys too young for the other school, was held in one large room very like the boys' school-room, but was not so dirty and disorderly. The number of scholars present was 89, of whom 14 were boys: the police return gives 91 girls as the number in attendance, and makes no note of the presence of any boys. One of the girls was a Protestant, she had come to the school for the first time, on the day before my visit. There is a parochial school close to this school, and the teachers informed me that occasionally Protestant children came to the national school by mistake, but they never remained more than a few days. The principal teacher of this school, also, who was the daughter of the schoolmaster, was absent, and the school was in charge of the assistant and one monitress. The children were much more orderly than the boys, but I was unable to examine into their proficiency, as the time for closing the school had come. Only six had reached the third class, and very few were twelve years old; some of them were mere infants who came to this school because there was no separate department for them. The principal teacher had been trained at the model school, and was in the first division of the third class, her salary amounted to £26, the stipend paid by the National Board being £20 and the rest derived from school-fees.

Ex. §§ 90, 265.

305. The peculiar situation of the school, underneath the church, has been mentioned; I saw no other Roman Catholic school so placed, but several Protestant schools in a somewhat similar position. I have on a previous page referred to the regulation of the National Board which bears on such cases, and which these schools seem to evade. There is one point in which this school differs from the others, the entrance is at some distance from the entrance to the church, and can only be approached by a lane leading out of High-street, which does not pass the church door; the Protestant schools were entered by doors which were in the same position with regard to the door of the chapel as the area door to the chief entrance of a dwelling-house.

St. Catherine's national school.

306. St. Catherine's national school in Meath-street, is situated in a district which in outward appearance, at least, is by far the worst that I saw. The houses are wretched and dilapidated; the lanes and courts filthy, and crowded with ragged children who ought to be at school; and the chief industry of the district seems to be engaged in processes evolving stenches which poison the air. The situation of the school is, perhaps, as good as it was possible to find in the neighbourhood, but is most unfortunate.

Buildings insufficient, and incapable of extension.

307. The West Dublin Model schools are very near these schools, but nevertheless the accommodation afforded by this National school in Meath-street was used to its fullest extent. The building was a large rectangular block, containing one large room on the first floor used as the girls' school-room, and another room on the ground floor not quite so large, and divided into two parts by a wooden partition, which was used by the boys and infants. No site was available for the erection of another school-room, and when the school was first established the buildings were constructed so as to contain two rooms only, because no separate department for infants formed a part of the scheme. On the formation of an infant school the only way of providing accommodation which could be devised was to take a portion of the boys' school-room. The consequence is that both the rooms are most inconveniently crowded, especially the infant school, in which nearly three times as many children were collected as the room ought to contain. The dimensions of the room are 21½ feet by 40 feet, and therefore 108 is the greatest number of children that ought to be assembled in the room. On the day of my visit 301 children (when the police counted, the attendance was 268) were present. The room is tolerably lofty, and nearly the whole of its area is occupied by a gallery, and thus space is found for the large number of children. The windows are well placed, and some attempt has been made to provide means of ventilation, so that the atmosphere is not so oppressive as might have been expected. The room was very clean and neat, and great care seemed to be taken of the children; though some of them were very ragged they were not dirty or untidy, and in appearance contrasted very favourably with the children in many of the schools.

Infant school.

308. The principal teacher had just been promoted, she had been formerly one of the assistants, of whom there are three, besides three paid monitresses. The head teacher was educated at the King's Inns-street Convent school, and was in the first division of the third class; her salary was £30, of which £20 were paid by the National Board, and the rest by the manager, who took the school-fees.

Boys' school.

309. The boys' school afforded space for 200 scholars, but contained 209 on the day of my visit, and 212 when the police counted the attendance. Here also the effects of the crowding on the atmosphere of the school were lessened by some attempt at ventilation, but another evil scarcely less injurious was caused. The noise of so many boys collected in one room was overwhelming; and I received a practical demonstration of the advantage of the arrangement commonly adopted in these schools, for placing the younger boys in a room by themselves. Not quite one-seventh of the boys

present had reached the third class, and the teachers told me that the proportion of boys who remained at school long enough to do this was very small. The greater number left school finally before they had passed through the second class. Judging from the proficiency of the boys in the third and fourth classes, I should think that the school was very efficiently conducted. These classes, however, contained the most promising scholars.

310. The number of classed teachers was four, but there were no monitors. The principal teacher was in the third division of the first class, but had not been trained in the model school. His class salary paid by the National Board was £38, and the manager gave him £22 instead of the school-fees.

Girls' school.

311. The girls' school-room occupied the whole of the upper part of the building, and was rather larger than the other two united; it afforded accommodation for 347 scholars, but only 229 were present on the day of my visit, and 244 when the police counted the attendance. Here the noise was worse than in the boys' school, and I was told by the teacher that the Inspector had recommended very strongly the division of the room into two separate parts. The ventilation was tolerably good, and the room and furniture were in excellent order. The proportion of scholars present above the second class was one-fifth; but I was told that most of the girls left school before they had advanced so far. The girls in the third and fourth classes wrote fairly from dictation, and rather more than half of them worked the sums I gave them correctly, but they did not reach the standard prescribed in the programme issued by the National Board. Four classed teachers and three monitresses formed the teaching staff. The principal teacher had been trained in the model school, and was in the second division of the second class. Her salary paid by the National Board was £24, and the manager gave her £12.

Want of judgment shown in the construction of the school buildings.

312. Great pains had clearly been taken to make this school efficient, and it is unfortunate that for want of good direction the result is not entirely satisfactory. The situation is not good, but probably no better could have been found in the district; the faults in the construction of the building which must interfere seriously with the efficiency of the school are just those which would have been avoided if the designs had been examined by an authority competent to decide on their fitness, and to suggest alterations and improvements. The buildings are quite new, and must have cost a considerable sum, which was raised from local sources only.

St. Nicholas' National Schools.

313. St. Nicholas' National school is situated on the edge of this district, and the immediate neighbourhood is in appearance very superior to the part in which the schools, which have been described, are situated.

314. The schools contain two separate departments for girls, and one for infants; there is no National school for boys, but the Christian Brothers have a school quite close to these. The girls' schools are not as in most cases senior and junior departments merely, but each school is complete in itself; the new admissions are divided between the schools, but no further attempt is made to keep them on an equality. The buildings consist of one large block containing two rooms, one on each floor, occupied by the girls' schools, and a smaller detached building which is used for the infant school. The girls' school-rooms were large and airy, and in excellent order, each afforded accommodation for 150 scholars, but the numbers present in them were 101 and 108; the numbers returned by the police were 136 and 138. All the scholars on the roll were Roman Catholics.

Unusual division of the girls' schools.

315. In one of the schools the number of classed teachers was three, and of monitresses, three; in the other, the number of teachers was the same, but there were only two monitresses. The proportion of scholars present in each school who had reached the third class was about one-fourth, and I was told that a large number of the girls remain at school long enough to become fit for the third, or even the fourth class. It is significant that this change in the duration of the school course is found where the inhabitants of the district are apparently in less straitened circumstances. I examined the girls in the third and fourth classes; they all read and wrote well, and the girls in the fourth class worked sums in practice and proportion, but the girls in the third class were not able to go beyond the simple rules. The quietness and order maintained were remarkable, and the schools appeared to me to be in all points thoroughly efficient. The principal teachers of each school had been trained in the model school, one was in the second division of the second class, the other in the second division of the first class. Their salaries included the payment from the National Board, corresponding to their classes, and a share of the fees paid in all the schools. These were paid to the manager who divided them equally between the teachers of the different schools. The share for last year was £7, so that the salaries of the two teachers mentioned were £31, and £37 respectively.

Infant school.

316. The infant school-room was very inferior to the others. When it was built the owners of the adjoining property forbade the opening of windows on one side of the room, and consequently all the light and air is admitted in one direction. The want of ventilation is very severely felt, especially as the room is rather crowded. The number of children for whom there is accommodation is 159, but the number present was 185, and the number returned by the police 230. The teacher complained very much of the want of fresh air, and with reason. The number of classed teachers was four, and of monitresses two; the principal teacher had been trained at Marlborough-street, and was in the second division of the first class. Her salary from the National Board was £36, and her share of the school-fees, as I have already stated, £7.

317. These schools have not been built many years, and are better than most National school buildings; the form of the girls' school might be more convenient, but this is a trifling defect; the chief necessaries, air and light, are abundantly supplied. The infant school is inferior, and should not have been built in such a situation, but this is only an instance of the numerous cases in which local effort has failed in providing good buildings either from want of money, or as here from want of proper direction.

Other national schools in this part of Dublin.

318. There are two other National schools in this district, one in John-street under the management of the Rev. P. Pentony, for girls and infants only, the other nearer the outskirts of Dublin, but in a very poor neighbourhood, and attached to the Roman Catholic church of St. James. The former I did not visit; the latter was closed for vacation, and I could only see the place in which it was held. This was an old dwelling-house, and as unfit for the purpose of a school as it possibly could be. A new building, however, was almost finished, which was to contain school-rooms for boys. When this was ready the manager of the school told me that he intended to withdraw his school from the

superintendence of the National Board and place it under the Christian Brothers. He said that his chief reason for this step was a strong persuasion that the effect of the rule of the National Board which forbids any allusion to religion or the exhibition of a religious emblem, except during the time of religious instruction, was most pernicious. The same objection was made to me by several managers of National schools, but no other had proceeded so far as to remove his school from connexion with the National system.

319. This ends my account of the National schools situated in the poorest and most densely-populated districts of Dublin. For the great mass of the poor, which is composed of Roman Catholics, these are the only schools available, and though, as has been shown, the accommodation provided is not used to its utmost extent, yet a very slight increase in the number of scholars would render an increase of the existing means of education necessary. Throughout the district the attendance of scholars is most irregular, and the amount of knowledge gained during the few years that they remain at school is so slight that it is hardly possible for them to retain it long. A boy who cannot read a newspaper, write without a copy, or work sums with ease in the first four rules of arithmetic, will probably when he ceases to go to school speedily relapse into perfect ignorance; and this is the case with the majority of the children in this part of Dublin since they do not rise above the second class before they leave school. It is not difficult to suggest the cause of the large per-centage of Roman Catholics who, according to the Census returns, are unable either to read or write.

320. The Protestant children in the same district attend the parochial schools, of which there is a great number, besides one or two endowed schools attended by children of the same class. In the parish of St. Bride the parochial school is in connexion with the National Board, and has been already described; the other parochial schools which I visited were St. Peter's, St. Nicholas, St. Catherine, St. Michael, and St. John, besides St. Patrick's Deanery and Knight's endowed schools. These do not exhaust the list of parochial schools, but are sufficient to give a fair representation of schools of this kind. Parochial and endowed schools.

321. St. Peter's parish includes a large portion of the suburbs of Dublin, and is divided into several ecclesiastical districts; in all of them there are parochial schools, but the schools which bear the name of the parish are situated in the city on the outskirts of the central district. St. Peter's Parochial Schools.

322. The schools contain a boarding establishment for boys and girls, and day schools for boys, girls, and infants. The boarders are of two classes, "orphans of respectable Protestant parentage, who are maintained entirely at the expense of the charity," and a small number admitted as far as there is accommodation on the annual payment of sums varying from £10 to £15. At the end of 1866 sixteen boys and seven girls were boarded free of expense; five boys and three girls were paid for by their friends.

323. The boys' school-room is separate from the rest of the buildings; it was large enough to accommodate many more boys in addition to those generally in attendance, and is well appointed and in good order. The number of scholars present on the day of my visit was forty-three out of sixty-one on the rolls of the school; all of them were members of the Established Church. The number returned by the police was forty. I examined the higher classes, in which the boys professed to have reached the standard of proficiency prescribed for the third and fourth classes in National schools. The boys wrote from dictation remarkably well; indeed they all escaped errors in spelling, which was a most unusual occurrence; in arithmetic they were rather backward, but very correct in their work. The boarders were quicker and more intelligent than the rest, as might have been expected. They all knew something of geography and of the history of England as related in a small compendium published by the Society for promoting Christian Knowledge. The school appeared to me to be one of the most efficient of its class, and contrasted very favourably with the great mass of such schools. The master, who had no assistance, was an English certificated teacher, and had been educated at the Exeter Training College. He lived at the school, and superintended the boys' boarding establishment. Boys' school.

324. The girls' and infant schools were held in two large airy rooms in the boarding-house; the girls' school-room was not nearly full, but the infant school could not have accommodated many more children. The number of girls present was thirty-eight out of fifty-five on the roll; the number returned by the police was thirty-three; all were members of the Established Church. The girls, like the boys, seemed to belong to a different class from that which furnishes scholars for the National schools; they were all well dressed, and a large proportion of more advanced age. I was told that most of the scholars remained at school until they were thirteen years old, and some even longer. The mistress had received no special training, she had no regular assistants, but ladies living in the parish frequently visit the school and teach some of the classes. Girls' school.

325. In the infant school 108 children were present out of 159 on the rolls, all of them being members of the Established Church. The children remained in this school until they were able to read, and consequently many of them were of considerable age. Some children I was told did not pass on to the other schools before they were eight or nine years old. Three teachers conducted the school; the head teacher had been trained at the Church Education Society's model infant school in Westland-row. Infant school.

326. The salaries of the five teachers amounted in 1866 to £210 5*s.* 6*d.*; but in addition to this the master of the boys' school and the mistress of the girls' school, who took care of the boarders, were boarded and lodged free of expense.

327. These schools are managed by a parochial committee and are not in connexion with any society. The system adopted is however the same as that recommended by the Church Education Society; every child, who is able, reads Scripture daily; further religious instruction is not compulsory; but as all the children were members of the Established Church no case had occurred of a refusal on the part of a parent to allow the children to learn the Church Catechism. The schools are examined annually by the Inspector of the schools on the foundation of Erasmus Smith, and gratuities are awarded to the teachers if the report is favourable. This arrangement is not of long standing, but was adopted because it was found that some more stringent examination was necessary in order to maintain the schools in a proper state of efficiency. Regulations by which these schools are conducted.

St. Nicholas' and St. Luke's Parochial School.

328. The parochial school of St. Nicholas and St. Luke is situated like the last-mentioned school on the outskirts of the poor and populous central district of Dublin; it is in connexion with the Church Education Society, and is a day school, with separate departments for boys, girls, and infants. The situation of the school, nearly surrounded by a large extent of open ground, is good, and the buildings are very fair; the boys' and infants' schools are large and airy, the girls' school not so good. The number of boys present was thirty-six out of fifty-eight on the roll; they were all Protestants. The police returned forty-five as the number in attendance, including two Roman Catholics. The room could accommodate a larger number of children, but additional furniture would be necessary.

Boys' school.

329. I examined the boys in the two higher classes, which contained exactly half the number present. The boys in the highest class wrote answers of some easy questions on English history; the rest wrote from dictation. The handwriting in both cases was good, but the spelling was incorrect, and the substance of the answers given by the boys in the highest class curiously at variance with facts. The boys were very weak in arithmetic; a few of them had learned a little Euclid, but they could not work a sum in practice, and many of the rest were unable to work sums in the four compound rules. I saw the school under very unfavourable circumstances, as it had been closed for six weeks in the end of the spring in consequence of the illness of the master. It had then been re-opened for a week and again closed for the summer holidays, which lasted more than four weeks, so that the school had not been in regular operation for nearly three months. The master had been trained in the Church Education Society's model school in Kildare-place; he had no assistant, and monitors were not employed. His salary as schoolmaster was £50, he received £20 in his capacity of parish clerk, and a residence rent free was provided for him. He said that the number of boys generally in attendance (forty-seven) was rather too large for him to manage; he occasionally got a good class at the head of the school, but when the boys composing it left school he was compelled to return to the younger boys; what became of them whilst he was devoting his attention to the boys in the highest class he left me to infer. Since his illness the clergyman had told him to cease teaching Euclid, as such work was too exhausting; it was certainly unnecessary whilst the boys were ignorant of more elementary subjects.

Girls' and infant schools.

330. In the girls' school thirty-five scholars were present out of sixty-nine on the rolls—all Protestants, the number returned by the police was forty-one. The room was inconveniently crowded, and not at all fit for a school; there was a class-room which seemed not to be used. Here, as in the boys' school, the scholars were older and apparently in better circumstances than those who attend National schools. The schoolmistress had been trained at the Church Education Society's model school, and her salary was £30, but no residence was provided for her.

331. In the infant school sixty-one children were present, all of them Protestants; the number returned by the police was seventy-one. The children remained in this school until they were able to read words of one syllable, and consequently there was a considerable number of children more than five years old. The schoolmistress received £30 annually and her assistant £15: but no residence was provided for either of them.

332. The schools are supported out of funds collected in the parish for charitable purposes in general, by charity sermons, subscriptions and bequests. Thirty boys and twenty girls are clothed, and, when fit, apprenticed, and the children in the infant school receive a portion of bread daily. This information was supplied by the rector of the parish, but he did not mention the sums which were spent on these various objects.

St. Catherine's Parochial School.

333. St. Catherine's parochial school, which is also in connexion with the Church Education Society, is very near the National school in the same parish, but has a better situation as it stands in a piece of open ground. There are two departments, one for boys, the other for girls and infants; the schoolmaster's wife, assisted by their daughter, teaches the girls and infants. The rooms were large enough to accommodate many more scholars, but contained no more furniture than was necessary. In the boys'

Boys' School.

school twenty-nine scholars, out of forty-one on the rolls, were present, all members of the Established Church; the number returned by the police was twenty-six. I examined all the boys except those in the lowest class, in reading, writing and arithmetic. They were weak in spelling and arithmetic, and inferior to boys of the same age at National schools. The master, who was also parish clerk, had been nearly thirty years in charge of the school. His annual salary amounted altogether to £40, and a residence rent free with fuel and gas was provided for him.

Girls' School.

334. In the girls' school, seventeen girls and fourteen infants were present at my visit; when the police counted the attendance, twenty-one girls and eighteen infants were present, all of them Protestants. I examined the girls in the two higher classes, of whom there were six. Two of them read very indifferently, and none of them could write well or spell correctly. They were also very weak in arithmetic. The children in both schools were younger and apparently of a poorer class than those in the two parochial schools last mentioned, but the difference in these respects is hardly sufficient to account for the inferiority of the school. The schoolmistress had been trained in the Church Education Society's school in Kildare-place; her salary was £30, and her daughter's £15, thus the whole family received £85 and lived in the residence which was provided for them free of charge.

335. The sums raised annually for the support of this school are very large; the amount in 1866 was £276 15*s*. Of this, £140 resulted from an endowment; £89 11*s*. were contributed by the trustees of the parish estates and £47 4*s*. were the proceeds of a charity sermon. It is not very clear how so large a sum can be spent on the schools unless a considerable amount is devoted to extraneous objects, such as clothing and apprenticing the scholars; but on these points no information was given me.

St. Michael's Parochial School.

336. St. Michael's parochial school, which is in connexion with the Church Education Society, contains separate departments for girls and infants. There is no boys' school; the boys from the infant school, as they become old enough, are generally transferred to St. John's parochial school, which is very near this school. The rooms were of sufficient size to accommodate a larger number of children than that which was present at my visit, but the furniture was inadequate and badly arranged. In

the girls' school I found twenty-nine girls and three boys present; the numbers returned by the police were twenty-nine girls and five boys, all of them Protestants. The boys, I was told, had attended the infant school with their sisters, and, at their parents' desire, continued to go to the same school with them. The schoolmistress and her daughter conducted the school, the former was appointed in 1844, and managed without assistance until 1867, when her daughter came to help her. Each received £30 a year, and lived in the residence which was provided for the school teachers.

337. The infant school was held in the same building, but in a smaller room; the number of children present was sixteen, all members of the Established Church. The number returned by the police was twenty-three. The schoolmistress, who had no assistance, had been trained in the Church Education Society's model infant school in Westland-row; her salary was £20 a year, but no residence was provided for her.

338. In both these schools every child paid a school-fee of 1*d.* per week, yet the teachers assured me that the parents were exceedingly poor, and utterly careless whether the children came to school or not.

St. John's Parochial Schools.

339. St. John's parochial schools, also in connexion with the Church Education Society, contain separate departments for boys, girls, and infants. The school-rooms were large and airy, but the furniture was not good nor well arranged. In the boys' school twenty-five scholars were present, out of thirty-two on the roll, all Protestants. The number returned by the police was twenty-four. I examined the boys in the two higher classes which contained nearly half the school. They were very weak in arithmetic, wrote badly, could not spell, and though professing to know the elements of geography and English history, were very ignorant of those subjects. The master said that the irregularity of attendance was extreme, and that the boys left school much too soon. Very few of them had reached the age of thirteen years; but in this respect the school did not differ from national schools, where the boys very seldom remain after they are thirteen years old. In the national schools, also, the attendance is very irregular, yet the scholars are much less ignorant than the boys in this school of the same age.

Boys' school.

340. The master was also parish clerk, and was paid £60 a year, £30 for teaching the day school, £10 for holding a night school during part of the year, and £20 on account of his clerkship; besides this a residence was provided for him.

Girls' school.

341. The girls' school was even less efficient than the boys'; the scholars wrote badly, could not spell, and were backward in arithmetic. The same complaints about irregularity of attendance were made, and the age of the older girls was less than is usual in parochial schools. The number present was eighteen, out of twenty-six on the roll; the number present when the police counted the attendance was sixteen, all of them Protestants; but the teacher told me that they were all considered to be Protestants, though many of them were the children of mixed marriages. The teacher's salary was £26, and a residence rent free was provided for her.

Infant school.

342. The infant school was the largest establishment of the three; fifty children out of 120 on the rolls were present; the police found forty-nine in attendance. They were all Protestants, though here also several were the children of mixed marriages. They remained in the school until they could read, and in general passed on to the other schools when they had reached the age of eight years. Two teachers conducted the school, the chief had been trained at the Church Education Society's school in Westland-row, and had been appointed to this school in 1853. Her salary was £30, the assistant's, £20, but no residence was provided for either of them.

343. All the children in these schools are free, much to the disadvantage of the school in the opinion of the manager, who is the clergyman of the parish, but he found it impossible to alter a custom which had prevailed for many years.

St. Patrick's Deanery Schools.

344. St. Patrick's Deanery school is a school for girls and infants, situated in the precincts of the cathedral, and is like other parochial schools. It is nominally under the control of a Board of Trustees, but Dr. Marks, one of the cathedral clergy, takes the active part in superintending the school.

Girls' school.

345. The girls' school is held in a room of an ordinary private house, not well suited to its purpose, and with insufficient and ill-arranged school furniture. Twenty-seven girls out of thirty-two on the rolls were present; the number present at the visit of the police was eighteen; one of the girls was a Roman Catholic, the rest were members of the Established Church. I examined the highest class, which contained ten girls; they wrote fairly, but could not spell correctly, and were unable to work sums in the four elementary rules of arithmetic. The school was one of the least efficient which I saw, and I think the cause of its inferiority may be attributed to the want of inspection. Other schools of the sort are inspected by the officer of the Church Education Society, or some other person who is not immediately concerned in their management, but this school, as far as I could learn, never underwent any inspection more serious than the casual visits of the clergy or others who had some local connexion with it.

Its state shows the need of inspection.

346. The mistress had been trained at the Church Education Society's model school in Kildare-place; her salary was £38 per annum; but no residence was provided for her.

Infant school.

347. The infant school was held in a detached building, erected from a modern Gothic design, in which provision for light and air had been sacrificed to architectural effect. The room was large and in excellent order, and apparently great care was taken of the children. Seventy-eight were present out of one hundred and fifty on the rolls, but whether they were all of the same religion was uncertain. I understood that no inquiries on that point were made when children were admitted to the school. Most of the children were, of course, very young, but a few were learning to read.

348. The schools are maintained by the proceeds of funds bequeathed for charitable purposes and by voluntary subscriptions. No separate account is kept for the school, and it is impossible to say how much is expended upon it.

Knight's Endowed School.

349. Knight's endowed school is close to the last-mentioned schools, and completes the system. It was I believe originally founded for the education in the Protestant religion of the male children of poor Papists; now, however, none but Protestants avail themselves of the privilege of education here. A full account of the school will be found in the Report of the Endowed Schools Commission.

350. At the time of my visit 15 boys were present out of 22 on the rolls; the police found 16 in

attendance. The room was small but quite large enough for the number of scholars, the furniture was sufficient. The instruction is supposed to be superior to that given in ordinary parochial schools, but the only subject in which any unusual proficiency was shown was handwriting. Much of the boys' time must have been wasted in learning to execute useless flourishes, and ornamental writing of different sorts. The four boys who were most advanced, wrote from dictation exceedingly well, their handwriting might have been taken from a copy book, and the spelling was faultless, but they were very slow; only one of them could work a sum in practice, the rest attempted it but made great mistakes; they had learnt something about the history of England and a little geography. The school on the whole appeared to be fairly efficient, and so far, its state appears to be the same as it was when inspected for the Endowed Schools Commission.

Parochial schools in this district too numerous, and less efficient than the national schools.

351. This is the last school of the parochial class situated in this part of Dublin, which I visited. There are several others, most of them very small. The number of such schools is far in excess of the wants of the population, though the actual accommodation afforded is not too large, and on this point the opinion of some managers of parochial schools confirms my own. The schools though attended by a class of children who may be expected to attend with regularity, and to remain at school, till they reach the age of thirteen, at the least, are distinctly inferior to the national schools, where the efforts of the teachers are continually thwarted by the irregularity of the scholars. The parochial school buildings are in general sufficient for their present purpose, but could not accommodate a larger number of scholars without considerable alteration, especially in the fittings of the rooms. If, however, several of them could be united into one large school, and the large funds which are at the disposal of the managers, were judiciously expended in providing proper school requisites and good teachers, there would be no reason why these schools should not rival or excel the national schools. At present the funds, which united would be sufficient to maintain one large and efficient establishment, are wasted on numerous petty schools of which but few are of real use. There should be some distinct understanding as to the manner in which the school funds are spent; at present the school is only considered as one of the parochial charities, and the expenditure is not separately provided for; in the school accounts, where they are kept, such items as apprentice fees for scholars, food and clothes for the poorer children occur. Such expenses may be perfectly legitimate, but cannot be said to be necessary in order to maintain the schools.

The proportion of adults able to read and write no accurate test of the efficiency of schools.

352. It may be thought that the inferiority of these schools to the national schools must be imaginary, because the per-centage of persons of the Established Church living in this part of Dublin, unable to read and write is much smaller than the corresponding per-centage of Roman Catholics, and the latter have been educated in national schools, whilst the former have attended parochial schools. There are two answers to this objection: the richer classes contain a much larger proportion of Protestants than the poorer, and such extreme ignorance is found among the poor only, therefore per-centages calculated on the whole population are not a fair test of the relative state of education among persons of the two religions; and secondly, the children in the parochial schools generally remain at school long enough to acquire the power of reading with ease, and this is sufficient to preserve them from a relapse into utter ignorance.

353. If the scholars in the national schools attended as long and as regularly as those in the parochial schools, and the per-centages unable to read and write of persons of the poorer class only were calculated, the result might be considered as a test of the relative excellence of the education which persons of different religions had received. If, however, the efficiency of a school be judged by the proportion of the whole number of scholars which attains the standard required in the different classes. there can be no doubt that the national schools will appear decidedly superior to the parochial schools The knowledge which the majority of the children in national schools profess to have gained is but small, but in general it has been acquired; in the parochial schools, the scholars almost universally fell short of the standard which they said they had reached.

Eastern district of South Dublin.

354. In the quarter of Dublin situated on the eastern side of Grafton-street, the number of primary schools is not very large, as might be expected in a district of which a large part is occupied by the wealthier classes. The part which the national system takes in education is here smaller than usual, especially in the case of boys. There is but one national boys' school, and that not very large. The girls' schools are, however, more numerous; the great convent school in Baggot-street, and two ordinary national schools, one in St. Andrew's parish and the other attached to a convent in Stephen's-green, educate a large number of girls; besides these there is a small national school in connexion with the Wesleyan chapel in Lombard-street. The school which is frequented by the most of the Roman Catholic boys, is conducted by the Christian Brothers, and is nearly as large as the Baggot-street convent school. There are several parochial schools, an establishment supported by the Irish Church Mission Society, and two endowed schools. One of these, on the foundation of Erasmus Smith, has already been mentioned; the other is called the Hibernian Marine School, and is not a primary school merely, but an orphanage for the children of seamen, and the course of instruction includes such subjects as navigation and elementary mathematics.

Lombard-street National School.

355. The only national school which I visited was the Wesleyan school in Lombard-street; it is held in a room under the chapel like the school in Blackhall-place, which it resembles in many other respects. I saw the school under very unfavourable conditions, as a school treat had been given on the previous day, and the attendance was very small. Only 21 children were present, and they were little more than infants; the school apparently was not visited by the police, as no mention is made of it in their returns. The school was taken into connexion by the National Board in May, 1868, but had been in operation for some years. The schoolmistress had been there since the beginning of 1864; she was not classed under the National Board, but had been continued in her post as a probationer; she was a Wesleyan. Of the children on the roll 23 were members of the Established Church, and 33 belonged to other Protestant denominations. The teacher's salary amounted to £37, of which sum the National Board paid £14, the manager, from funds collected by voluntary subscriptions, £10, and the school-fees amounted on the average to £13. The children seldom remain in this school after they reach the age of ten or eleven years but go to larger schools: this is little more than an infant school.

356. Not far from this school is the Irish Church Mission school for boys in Townsend-street, and the girls' school in Luke-street; the boys' school is called a ragged school, though why such a name should be given is not very clear, as the boys were far better clad than many of the scholars in parochial schools in other parts of Dublin, not to speak of National schools. The number of boys present was 89, out of 116 on the roll; the number present at the visit of the police was 109, of whom 75 were Protestants and 34 Roman Catholics. The master could not tell me the numbers of each religion; no distinction is made in the instruction given to the scholars, all are trained in "controversy" and are supposed to be Protestants. I was told that the first object of the school was to instruct the boys in religion, and that the end was so far attained that most of the scholars who attended regularly became conscientious Protestants, whatever their creed might have been before they came to this school. The boys who attend regularly are rewarded with clothes and food, and by this means a much better attendance is obtained at this school than at most others. The age of some of the scholars was more advanced than usual, but their proficiency in secular knowledge, though fair, was not at all remarkable. Irish Church Mission Schools, Townsend-st. and Luke-st.

357. In Luke-street is situated a large school for girls and infants, supported by the same society. Most of the girls are clothed, boarded, and educated; they are, of course, instructed in the principles of the Protestant religion. The schoolmistress told me that many of the children were Roman Catholics when they first came to the school, but that they generally became Protestants, and eventually she hoped Christians, under the influence of the instruction which they received. The chief aim of the school was to bring up the children in the religion which the promoters of the school considered to be correct, and no secret was made of this. Parents, therefore, who allow their children to go to the school can have no reason for complaint if they find that the children are educated in a different creed from their own.

358. The number of girls present was 54, and of these 21 were nominally Roman Catholics; the infants were not in school during the time of my visit, and therefore I did not find out how many were in attendance. The police returns give 63 as the number present in the girls' school, and 100 in the infants' school; 65 of the children were Protestants and 98 Roman Catholics.

359. The society has other schools in Dublin but I did not think it necessary to visit them, as I was assured that the same system was adopted in all.

360. St. Anne's parochial school, like St. Peter's, is independent of any except local control, and is a boarding as well as a day school. It contains separate departments for boys, girls, and infants, the two latter being day schools only. St. Anne's Parochial School.

361. The boys' school-room is sufficiently large, well-ventilated, and properly supplied with furniture. The number of boys present was forty-two, all of them Protestants; the number on the roll was seventy-two, including fifty-seven members of the Established Church, eleven Presbyterians, and four Roman Catholics. The system of the national schools is followed except with regard to religious instruction, all children being required to read Scripture daily, but the national school books are used, and the programme issued by the Commissioners regulates the course of instruction. Rather more than half of the boys present had reached the third or fourth class, and most of them came up to the standard of proficiency required from these classes. They wrote from dictation with more than usually correct orthography, and their arithmetical work was very fair. The boys were young, only one or two being more than thirteen years of age. Their proficiency is rather remarkable, when their age is taken into consideration; but it must be remembered that many of them are boarders, and consequently, regular in their attendance. The school is, however, one of the most efficient not only among parochial but among schools in general which I saw. The master had been trained at Kildare-place. His salary was £77 a year, and a residence, fuel, and gas were provided for him; but for this remuneration he undertook the care of the boarders as well as the day school. He had no assistance of any sort. Boys' school.

362. The infant school-room was a part of the same building as the boys' school. The number of children present was sixty-five out of 100 on the roll. Rather more than two-thirds of them were Protestants, the rest Roman Catholics. They were left in charge of one teacher only, but she seemed quite able to conduct the school. Her salary was £32, but no residence was provided for her.

363. The girls' school was held in a public room, known as Molesworth Hall. The girls were collected in one corner of the room, in which scarcely any school furniture had been placed. The number present was thirty-five out of sixty on the roll. Four of the scholars on the roll were Roman Catholics, but all who were present were Protestants. I examined the girls in the highest class. They wrote badly and were not very correct in spelling; in arithmetic also they were backward and very inaccurate. This department of the school was very inferior to the rest; but I think that the chief cause is the extreme difficulty of conducting a school at all in such a place and with such means as were provided for this school. The teacher had been trained at the Church Education Society's school in Kildare-place. Her salary was £30, but no residence was provided for her. Girls' school.

364. I did not see any more schools in this part of Dublin. The most important, viz., the Baggot-street school, the Christian Brothers', and the model schools of the Church Education Society in Kildare-place, were not included among those which were subjects for my inquiry, and of the rest those I have described are sufficient representatives. Other schools in the district.

365. In Moss-street, one of the narrow and crowded thoroughfares which lead from the City Quay, there is a private adventure school, which has already existed over seven years, and presents many points of interest. I did not visit the school personally, but I am able to supply the following authentic description:— Private school in Moss-street.

"The school is conducted in a room on the first floor, which is rather small for the number of scholars, although not open to more serious objection on this account than many of the National schools. The teacher is a Roman Catholic, and had never been trained in any institution. He seemed a quick, intelligent man, reminding one forcibly, by his manner and conversation, of the traditional description of the old Hedge schoolmaster. His pupils, according to his own account, average in number from forty to fifty. As their attendance is capricious, his arrangement with them is weekly. The 'beginners,' who constitute the largest number, pay 2*d.* a week; the 'spellers,' who average fifteen, 3*d.*; and the 'readers,' of whom there are six, 6*d.*; but he

quaintly says, that 'he looks upon himself as a rich man the morning upon which his weekly income, all told, reaches from six to seven or eight shillings.' The books used are Carpenter's Spelling Book and the Christian Brothers' books. The children were almost exclusively Roman Catholics, and daily learned their Catechism, which was explained to them by the master. There were two Protestants in the school, but they were required by the master to retire during the religious instruction of the Roman Catholic children. They were also permitted to bring with them any reading books which their parents might choose, and use them instead of the books of the Christian Brothers. The subjects taught were reading, spelling, writing, arithmetic, and the master laid special stress on his efforts to teach thoroughly the English grammar. The school being situated almost on the quay, and in the very midst of the chief resort of the shipping, it was not surprising to hear that some boys learned geometry, algebra, and the elements of navigation. He stated, also, that occasionally pupils of a more mature age came to be specially prepared in subjects connected with seafaring pursuits; and but for the assistance derived from this source, he would scarcely be able to maintain his position, humble as it is.

"It was not possible to examine any of the classes. The children seemed intelligent, and were much cleaner, neater, and more orderly than I should have expected. About one-third of those present were girls."

366. The apparently flourishing condition of such a school, situated in one of the poorest and most densely inhabited districts of Dublin, seems to indicate a deficiency in the school accommodation provided wholly or partly by the State. At the same time it must be observed that some of these scholars could not belong to that poorest class for which it is most necessary to provide the means of education. The regular payment of such fees as were required in this school is probably beyond the means of many parents; yet it is worthy of consideration whether a similar stimulus to regular attendance cannot be used in all cases.

367. With regard to the sufficiency of the school accommodation for the wants of the population I discovered nothing which conflicts with the general state indicated by the tables at the beginning of this portion of my report. No complaint was made of the redundancy of parochial schools, which are much less numerous in this part of Dublin. Dr. Dickinson, the rector of St. Anne's parish, in a letter, which will be found in an appendix, makes some important observations on the state of education in the district to which it is only necessary to refer.

Suburban district.

368. The semicircle of suburbs extending from Ringsend to Inchicore which I have included in the district of South Dublin consists of the towns of Ringsend and Irishtown, the parish of Donnybrook, and the towns of Rathmines, Rathgar, and Harold's-cross. Ringsend and Irishtown differ from the rest of the district. Their population is chiefly of the labouring class, whilst elsewhere the middle class element predominates. At Ringsend and Irishtown there are national schools and no others; in other parts of the district there are not many national schools, and only a few parochial schools, but a large number of schools of a superior class.

369. Ringsend town is inhabited by persons engaged in the docks and in factories or in fishing. It is situated on the property of Lord Pembroke, who gives very liberal support to the national school.

Ringsend School.

370. The school is vested in the Commissioners of National Education, and they have appointed J. E. Vernon, esq., Lord Pembroke's agent, manager of the schools. The history of the schools as related to me on the spot, is very remarkable. When the schools were established the Protestant rector of Donnybrook and the Roman Catholic parish priest agreed that they would support the schools and encourage the attendance of all children over whom they had any influence. The school then contained two departments, one for boys and the other for girls, and it was settled that the rector should appoint the teacher in one school, the parish priest the teacher of the other. Both of these clergymen are no longer living in the neighbourhood, and their successors do not follow the same line of conduct with respect to the schools. This statement, however, I have reason to think incorrect, as Mr. Vernon was entirely ignorant of such an arrangement. The tradition of the appointment of the teachers has, however, been observed, and the master of the boys' school is a Roman Catholic, whilst the head teacher of the girls' and the infants' schools are Protestants. Whether under the previous circumstances the attendance of children of all religions at this school was obtained I do not know, but during the last few years the attendance of Protestants has been decreasing. From information which I received from the manager of the national school in the adjoining district of Irishtown I should conclude that no great success had attended the efforts of the clergy. At present the proportion of Protestants attending the school is very small, though larger than in most National schools where the scholars are chiefly Roman Catholics. The total Protestant population of the district is not quite one-fourth of the whole, and therefore, not quite one-third of the Roman Catholic population. Of the boys on the roll of the school ninety-seven were Roman Catholics and only four Protestants, of the girls 129 were Roman Catholics and seventeen Protestants, and of the infants 136 were Roman Catholics and eighteen Protestants. It will be observed that the proportion of Protestants is larger in those departments of the school in which the head teacher is a Protestant.

371. Some additional information with regard to this school which Mr. Vernon has kindly supplied will be found in Appendix III. to my report.

372. The buildings are not very modern, and though kept in excellent repair and in good order, are not well suited to their purpose. The want of ventilation was very sensible, yet none of the rooms were occupied to the full extent of their capacity.

Boys' school.

373. In the boys' school, 76 scholars were present at my visit; the police found 111 scholars, of whom five were Protestants. Of the whole number in attendance I found that only four had reached the third class, and that the larger portion of the children was included in the first class. The master told me that very few of the boys ceased to attend school before they reached the second class, but that the number of those who advanced beyond the second class was not much larger. This argues ill for the state of education among the inhabitants of the place, and accounts for the unusually large proportion of persons unable to read or write. The age at which boys leave school is very early; as soon as they are able they go to sea in the fishing boats, whenever their services are required. Besides this attraction, there are factories of different kinds in which they can obtain employment. I examined the boys in the third and fourth classes, and some of those in the second. The result was most satisfactory. All were able to write well, and to spell with more than the usual correctness. The boys in the higher classes worked sums in the rules prescribed by the programme

correctly and rapidly; the boys in the second class were a little backward, but fairly correct in their work. The school appeared to be most efficiently conducted; the boys were very quiet and orderly, and the teachers, judging from a lesson to which I listened, well qualified for their posts. The number of classed teachers was three, and there was one monitor, all Roman Catholics. The head teacher had been trained in the model school, and was in the first division of the first class. He conducted the evening school also, and his annual salary from all sources amounted to £102, exclusive of a good service pension, which I understood the inspector had suspended. The portion of the salary paid by the National Board was £52, the manager paid him £30 on account of the day school, and £20 for the night school, but took the school-fees. A residence at the school was provided rent free for the teacher, where also his son, who was the first assistant, lived.

374. The night school was not in operation during my visit, but some returns which have since been forwarded to me show that the average attendance during the month of September was fifty-one, and that the average age was thirteen years. A copy of these returns will be found in Appendix III.

375. The master told me that the establishment of the Christian Brothers' schools in Westland-row had seriously injured his school. The class of boys who in former times used to remain at his school now attended these notwithstanding the distance at which they were situated. He gave me to understand distinctly that the parents were strongly recommended by their clergy to send their children to the Christian Brothers in preference to the National schools, because of the more religious training given by the former. Schools injured by the establishment of schools by the Christian Brothers.

376. The girls' school-room was not so large as the boys' room, and was rather crowded, though the number present, sixty-five, was considerably less than the number, ninety-five, which the room could accommodate. The number returned by the police was ninety-two, including five Protestants. Eight scholars had advanced beyond the second class, but I was told by the schoolmistress that the majority of the girls left school before they reached the third class. I examined the girls in the fourth class and some of those in the second. The writing and spelling were far above the average, and the knowledge of arithmetic, though limited in extent, was remarkably accurate. They worked the sums I gave them correctly, and were able to write down in figures a number of six digits which I dictated; this was an accomplishment which no other school children whom I saw possessed. The number of classed teachers was two, but no monitresses were employed. The head teacher was, as has been mentioned, a Protestant, but the assistant was a Roman Catholic, and on her their duty of giving religious instruction devolved. The head teacher had been trained in Dublin, and was in the first division of the first class; her salary amounted to £62, of which sum the National Board contributed £42, and the manager, £20; a residence at the school was provided for her rent free. Girls' school.

377. The infant school was the smallest of the three; it was held in a room of sufficient size, but not well ventilated. There was space for seventy-two children, the number present was sixty-four, out of 136 on the roll, the number present at the visit of the police was sixty-five, of whom five were Protestants. Five of the children had begun to read in the Second Book, and still remained in the infant school. The principal teacher was a Protestant, the assistant and the monitress, Catholics, and the religious instruction was almost entirely given by them, though when any Protestant children attended the head teacher instructed them. Her salary from the National Board was £24, and from the manager, £15, and a residence rent free was provided for her. Infant school.

378. This school was built, I was told, by the late Lord Herbert, and its chief local support is given by the agent of the Pembroke estate. The school is now vested and had been visited by the officer of the Board of Works in the early part of the year 1868. The amount contributed in the locality towards the teacher's salaries in 1866 was £117, besides £12 derived from school-fees. The aid given by the Board in the same year amounted to £237 8*s.* 4*d.*, but this includes the grant to the evening school, towards the expense of which the sum of £36 10*s.* 1*d.* was raised in the neighbourhood. Mr. Vernon has sent a full account of the sums expended on this school by Lord Pembroke's guardians since 1866, which, with the rest of his valuable information, will be found in Appendix III.

379. The Irishtown schools have not always been national schools, but were formerly in connexion with the Church Education Society. The local support was, however, insufficient to maintain the schools and they were placed under the National Board. They are non-vested. The patron is the Rev. Dr. Wall, the chaplain of St. Matthew's, Ringsend, who first established the school, collected the funds with which the buildings were erected, and is the patron. He sent me some valuable remarks on the state of education in this district, which will be found in Appendix I. to my report. Irishtown National school.

380. The school-rooms are large and well appointed, but not well ventilated. The boys' school-room is on the ground floor, the girls' on the floor above. In the boys' school sixty-four scholars were present out of 105 on the roll; the number returned by the police was only seven; so the school cannot have been in full operation when the attendance was counted. Boys' school.

381. Of the scholars on the roll ninety-three were Protestants and twelve Roman Catholics. A very large proportion of the scholars had reached the third class, and I was told that it was very unusual for boys to leave school finally before they had entered the third class at least. In this respect the school presents a marked contrast with the Ringsend school; probably the cause of the difference is the greater poverty of the children who attend the latter school. I examined the fourth class and part of the second, the same classes as I had examined at Ringsend, and I found that the boys were distinctly inferior. They attained, however, the average proficiency in the usual subjects. The head teacher was assisted by a monitor only. He had been the master of the school before it was placed under the National Board, and was continued in his post. He had been trained at the Church Education Society's school in Kildare-place, and, after examination, had been placed in the first division of the third class in the classification adopted by the National Board. His salary from the Board was £24, and from the school-fees and manager £40, also a residence was provided for him at the school.

382. The girls' school-room was smaller than the former, but still was large enough to accommodate not only the number of scholars generally in attendance, but also the whole number on the rolls. This was sixty-eight—sixty-four Protestants and four Roman Catholics. The number present at my visit was forty-three, of whom about twenty were little more than infants. The girls were, however, Girls' school.

younger and less advanced than the boys; only three had entered the third class. I examined these girls, and some of those in the second class, and they were, if anything, superior to the boys of the same standing in the other school. The schoolmistress was assisted by two monitresses. She had been trained in the model schools and was in the third division of the first class. Her salary amounted to £67, of which sum the National Board paid £30, the manager £30, and the school-fees supplied the rest. No residence was provided for her.

383. The school receives considerable local support. The private subscriptions in the year 1866 amounted to £52 14*s.*, and the sum of £11 13*s.* 8*d.* was collected after charity sermons.

Donnybrook. 384. In Donnybrook the parochial school on the foundation of Erasmus Smith is the only primary school. There are National schools at Milltown and other places at no great distance which the Roman Catholic children attend if they go to school at all.

Donnybrook parochial school. 385. The parochial school had not been in full operation during the first six months of 1868. The boys' school had been in a state of great disorder, because no schoolmaster could be permanently appointed. On the day of my visit twenty boys were present, fifteen Protestants and five Roman Catholics. The police found sixteen boys in attendance, of whom four were Roman Catholics. I examined the boys whom the master selected as the most advanced. They wrote very badly, their spelling was exceedingly bad, and though they professed to have made considerable progress in arithmetic, their knowledge of its first elements was quite worthless. The wretched state of the school was not so very unintelligible when the long-continued state of disorder is taken into consideration.

Girls' school. 386. The girls' school was much more satisfactory. It is held in a large, well-appointed room, which was kept in excellent order. The number of girls on the rolls was fifty-six; the number present was thirty-six, of whom four were Roman Catholics. I examined the girls in the highest class. They wrote from dictation and worked sums in arithmetic without making any mistakes, and answered my questions on the history of England and on geography with great intelligence. I saw some excellent dictation exercises which the younger girls had just written on their slates in the ordinary course of the school-work. The girls in the highest class were rather older than usual; but making every allowance for their age, their proficiency showed that they had been very carefully taught. The schoolmistress had no assistance. She had been trained in the National model schools and was placed in the second class when she passed the teachers' examination. Her salary amounted to £45, towards which the Board of Erasmus Smith contributed £30, and the rest was raised by subscription in the parish. A residence rent free, with gas and fuel, was also provided for her.

387. The school is supported principally by local subscriptions, the aid given by the Board of Erasmus Smith being limited to grants towards the teachers' salaries. In 1866 the local subscriptions and collection after the charity sermon produced about £75. Besides this sum the school-fees amounted to £7, and there is a small endowment producing rather more than £2 per annum.

Harold's Cross. 388. Of the rest of the suburban towns I visited Harold's Cross only. The places are much alike, and any one is a fair representative of the rest. At Harold's Cross there is a national school for boys, and attached to a convent there is a school for girls, in which the secular instruction is given by ordinary classed teachers, but the religious instruction is provided by the nuns.

National school. 389. The boys' national school is held in a room of sufficient size, but without means of ventilation except by the windows. The room was kept in excellent repair, and the furniture was very good. In the large room, and a small class-room, accommodation was afforded for 144 scholars, two less than the number on the roll. The number present at my visit was ninety-seven, the number returned by the police was ninety-eight. All the scholars on the roll were Roman Catholics. Rather more than one quarter of the boys present had passed through the second class and entered the higher classes; only five, however, had reached the fourth class. I examined them, and some of the boys in the second class, with most unusually satisfactory results. They wrote well, could spell correctly, and had reached the standard of proficiency in arithmetic required in the programme. They had some knowledge of geography, and answered my questions with great intelligence. This school was one of the best which I saw, and could hardly be improved except by the erection of new buildings. The teacher told me that many of the boys were the children of persons in comfortable circumstances, and that their attendance was fairly regular. Certainly the scholars showed none of those signs of poverty which can be so easily noticed in the city schools.

390. The number of classed teachers was two, and there were two monitors. The head teacher had been trained in Dublin, and was in the first division of the first class. His salary amounted to £91; the stipend paid by the National Board was £70, the manager gave him £12, and the school fees amounted to £9 on the average; no residence was provided for him.

St. Clare's National school. 391. St. Clare's national school is held in a large room of inconvenient shape, consisting of two parts at right angles to each other, either one of which would have been sufficiently large for the number of children present when I examined the school. This number was 72 out of 148 on the roll; the number returned by the police was 170, which must include an infant school which I did not visit. About one-fifth of the whole number of girls had reached the third class, and six of these were in the fourth class. Many of the girls were little more than infants, but I was told that almost all remained at school until they entered the higher classes, though the small proportion of the whole number contained in the higher class would seem to indicate a less satisfactory state of affairs. The girls in the higher classes wrote from dictation fairly, and their arithmetical work was tolerably correct; those girls in the second class, whom I examined, were comparatively inferior, especially in arithmetic. Still, on the whole, the school was efficient, though by no means equal to the boys' school which I had just before visited.

392. Two classed teachers and two monitresses formed the teaching staff. The head teacher had been trained in Dublin, and was in the third division of the first class; her salary amounted to £39, of which sum the school-fees produced £9, and the rest was paid by the National Board.

393. An orphanage is attached to the same convent, but is perfectly distinct from the school; only eight children were there when the police counted the attendance.

R. Macklin's school. 394. Ralph Macklin's school is on the edge of this district, but is within the city. I have already mentioned this school at § 35, as being very inefficient, and at the same time pretentious. The

scholars who attend are nearly of the same class as those who go to the parochial schools; but there are no poor children among them. I was told that parents preferred this school because attendance at it was supposed to indicate the social superiority of the scholars. The desire of obtaining the best instruction for the children could not have been the motive which prevailed when the school was selected, for it was one of the worst which I saw. I did not examine the girls' school; it is held in a room of the same house, which is not large enough, and utterly without ventilation. I visited it at the end of the day, and found the state of the atmosphere so intolerable that I could not remain there.

395. The schools are under the control of a board of trustees, of whom the Rector of Maynooth is apparently the active member, and visits the school once in every week. In answer to some inquiries which I addressed to him, he gave me the following information:—

"(1.) The endowment was originally given for a poor school, to be held on Sundays and Thursdays; but on the best legal opinion the trustees had made it a daily school.

"(2.) The annual amount of the endowment is at present about £150.

"(3.) The school embraces the objects of a primary and better class school. There is no fixed rule with regard to religious instruction; but the children of the Established Church are examined in Scripture and the Church catechism.

"(4.) The salaries of the master and mistress are £45 each, and their posts are held on the condition of the satisfactory discharge of the duties attached, which they have done most faithfully for many years."

396. This concludes my description of the primary schools in south Dublin which I visited. Most of the principal National schools have been mentioned, and all other schools to which my attention was directed. It must be remembered, however, that my account is but a partial representation of the existing means of educating the poor, because very nearly one-half the scholars attend the Christian Brothers, the convent, and the model schools, and these were expressly excluded from the list of schools, into the circumstances of which I was to inquire.

PART II.

Section IV.—4. Schools in the Suburbs of Dublin.

Suburbs of Dublin.

397. I now proceed to give an account of the purely suburban district, of which Kingstown is the chief place, and which consists of the towns of Blackrock, Booterstown, Monkstown, Dalkey, Kingstown, and the adjacent counties. I was unable to examine more than a part of the schools situated in the district, but the general similarity which I noticed in the schools which I saw leads me to think that no advantage would have been gained by extending my inspection to a greater number of cases.

398. The following tables drawn up in the same way as those relating to Dublin indicate the proportion of the children of school age who are attending schools, and the kind of schools most frequented.

Table L.—Attendance of Scholars on June 19, and estimated Number of Children of School age.

Booterstown, Blackrock, Monkstown, Kingstown, &c.

Large number of superior schools causes an apparent increase in the proportion of scholars.

399. The large proportion of scholars in attendance at private schools of a superior class is peculiar to this district. Many of the scholars are boarders, and come from other places, and their presence in these schools raises unduly the per-centages of the whole number of children which is in attendance at school. The tables indicate a larger attendance here than in any other place which I visited, but I was assured by persons living in the neighbourhood, and able to speak with authority on the subject, that the irregularity of the children who frequent primary schools is at least as great here as anywhere else. In the summer especially great difficulty is found in procuring at all frequent attendance. The national schools, excluding the convent schools, do not take as large a share as usual in educating the poor, and the absence of Protestant children from them is almost complete. This is not remarkable, because occurring in a district in which so many of the inhabitants are of the wealthier class, and no difficulty is found in collecting money to support schools. Indeed I was told by the manager of a parochial school, that so far from finding any difficulty in collecting funds for his schools, the money subscribed was more than he wanted.

* See paragraph 400 for an explanation of the classes of schools grouped as A and B.

400. The private schools mentioned in the tables are of two kinds. Those distinguished by the letter B belong to the superior class already mentioned, the rest entered as "private schools A," include two orphanages only. One of these is for Roman Catholic girls, the other known as the "Bird's Nest," is an establishment supported by the Society for promoting Irish Church Missions. I heard the school frequently mentioned with very various comments, but I came to the conclusion that it was unadvisable to make any personal inquiry into the objects and method of conducting the school.

Booterstown National school.

401. The schools which I visited were these: the national schools at Booterstown and Blackrock, the national convent schools at Booterstown and Kingstown, the Christian Brothers' school at Kingstown, and the parochial schools at Booterstown, Blackrock, Monkstown, Stillorgan, and Glasthule.

402. The Booterstown and Blackrock national schools are under the management of Monsignor Forde, the parish priest of Booterstown. The school at Blackrock contains departments for boys, girls, and infants. The school at Booterstown is for boys only. The building, which is vested in trustees, has been recently erected, and is exceedingly good. The accommodation is sufficient for a much larger number of scholars even than the number on the rolls. The number present was fifty-four, all of them Roman Catholics, but the police found fifty-seven scholars present, one of whom was a Protestant. The schoolmaster had no assistant and only one monitor. He had been trained in the model schools and was in the first division of the first class. His salary amounted in all to £82; of this sum the National Board paid £63, the manager £12, and the rest was derived from school-fees. No residence was provided. The teacher was able, however, to increase his income considerably by giving private instruction. The manager told me he believed that a great part of the teacher's spare time was spent in this sort of work. It is the only instance of the kind of which I heard; but it is strange that other teachers do not endeavour to help themselves in the same way. This means of adding to the teacher's salary would not be available in the country, where no persons are to be found desirous of receiving instruction; nor would any but teachers of high qualifications be likely to obtain private pupils, and they are not the class of teachers who are in most straitened circumstances.

Convent school.

403. The national convent school at Booterstown was in many respects very different from all other schools of the kind which I saw. The buildings were not too small; the chief room was more than sufficient to accommodate the number of children in attendance, and there was a class-room besides; but the ventilation was wretched, and the offices were so badly placed as to poison the air which entered by the door and windows. The number of children present was 119, the number on the roll 145, all of them Roman Catholics. All the scholars, both girls and infants, were collected in the large room, but I found the state of the atmosphere so oppressive that I was very glad to go into the class-room, which is detached from the main building, and there examine the class I selected. This was the third class, the highest in the school, and containing nearly a quarter of the children present. Many of the girls had been but lately promoted, and consequently the usual proficiency was not to be expected from them. After making every allowance, however, the fact cannot be disguised that the majority of the girls were quite unfit for the class. Some of them read very badly, many could not write properly, and their knowledge of arithmetic was very limited, as nearly half of them were unable to work a sum in simple multiplication. The school is attached to a convent of Sisters of Mercy. Two of the Sisters conduct the school with the assistance of four senior and nine junior monitresses.

Booterstown parochial school.

404. The Booterstown parochial school was a very small establishment. It contained separate departments for boys and girls. Fourteen scholars were present in one and twenty-three in the other. The boys were very backward; they could read, but their writing and spelling were both very poor, and their knowledge of arithmetic was very limited in extent. In this subject, however, their work was more satisfactory than in any other. Two boys were more than fifteen years old, and two others more than fourteen; so that a higher standard of proficiency might have been expected. The clergyman told me that the schoolmaster had a great difficulty to contend against in the extreme irregularity of the children. Their parents were servants or lodge-keepers in the neighbourhood, and did not reside there permanently, and of course took their children with them when they moved. Books or clothes were given to the children at Christmas as rewards for regular attendance, but they did not prove very effective. I did not examine the girls' school. It seemed very quiet and orderly, and was held in a good school-room well supplied with furniture. The teachers of both schools had been trained in the Church Education Society's model schools. They lived in the school-house and were provided with fuel and gas. The schoolmaster was paid £32 10*s.*, the schoolmistress £22 10*s.*, besides the small sum which was received in school-fees. The school was entirely dependent on local subscriptions, which were quite sufficient for its support.

Blackrock National school.

405. The Blackrock National school contains three separate departments for boys, girls, and infants, all of which occupy the same building. The girls and infants' schools are on the ground floor; the boys' school on the floor above. The school-house was in good repair; the rooms were more than sufficient for the number in attendance, and well supplied with furniture. In the boys' school there is accommodation for 186 boys in the large room and a smaller class-room attached to it. The room is lofty and well ventilated. The number of scholars present was sixty-nine; the number on the roll 124, all of them Roman Catholics, but the police found forty-five scholars only in attendance. Not quite one-fourth of the whole number of boys present had passed through the second class. I was told that most boys remained at school long enough to reach the third class. I examined the third and fourth classes and part of the second; the boys wrote very well from dictation, and were very accurate in their arithmetical work; they had reached the standard prescribed in the programme. These satisfactory results were especially creditable to the teacher, because the school had only been in operation for three days since the end of the summer holidays, and therefore the boys must have been very thoroughly taught. The master had two classed assistants, but no monitors. He had been trained in the model school and was in the third division of the first class. His class salary was £38. The manager paid him £20 annually, and the school-fees amounted to £7 10*s.*

Girls' and infant schools.

406. The girls' school-room was much crowded and was not so well ventilated as the last. The infants' school, which was close to the other, was of much the same character. The number of children present was 223, of whom 168 were in the first class and belonged for the most part to the infant

school. The number of scholars on the roll was 352, all Roman Catholics. The school was conducted by two Sisters of Mercy, who came over daily from the convent at Booterstown; they were assisted by one pupil-teacher, five senior, and six junior monitresses. The proportion of girls in the third class was about one-fourth of the whole number, and I was told that most girls reached the third class before they left school finally. None had reached the fourth class.

Local support given to these schools.

407. These schools were also under the management of Monsignor Forde; he told me that in addition to the aid granted by the National Board, he was able to collect sufficient funds to maintain the buildings in a proper state, and to make any addition or alteration that might be necessary, besides supplementing the salaries of the teachers, not only of these schools, but also of others situated in the parish.

Carysfort parochial school.

408. There is a small parochial school in connexion with the district church at Blackrock, but it is little more than an infant school. On the day of my visit thirty children were present, eighteen girls and twelve boys, two of them Roman Catholics. The schoolmistress said that when the boys were old enough they generally went to the Booterstown school, but that girls frequently remained with her. One or two of the boys remained at this school because their sisters were there, and the parents did not wish their children to be separated. The room was of good size, airy and light, but was not well supplied with furniture. The mistress lived in the house, and was provided with gas and fuel; her salary amounted to £24 annually.

Kingstown Christian Brothers' school.

409. At Kingstown the Christian Brothers' school, and a convent school in connexion with the National Board, are the most important schools. I visited the former on a very unfavourable occasion, when many of the boys were at the church assisting at the celebration of some festival peculiar to the place. I went over the school-room, and examined some of the boys who were present. The schools seemed to me to be almost exactly like those at Drogheda, which I have described in a previous part of my report. Some of the boys here were more advanced than any in that school. There was a class learning Latin in preparation for the entrance-examination at Maynooth; and the director told me that he had made arrangements for teaching French to some boys. The class of boys who attend this school was unusually mixed; many boys were the sons of tradesmen, who were in comparatively easy circumstances, whilst the parents of others were labourers in the harbour, and many of them exceedingly poor. The boys of this class were less regular in their attendance, and remained at school for a shorter period than the others, and very few of them reached the highest department of the school, but they were treated in the same way as the rest of the boys. No great objections were made by the parents to the association of their children with those of a different class; yet elsewhere I was assured that it would be useless to try to induce persons of what may be called the lower middle class to send their children to schools attended by the poor.

Mixture of classes in this school.

410. The number of boys present when the police counted the attendance was 354, all of them Roman Catholics. A Protestant had attended the school for some time quite lately without receiving any religious instruction, or joining in the devotional practices of the rest of the school, but he had left the school for another, because his solitary position among companions of another religion was intolerable. A similar reason may have weight with Protestant parents elsewhere in making choice of a school to which they should send their children. Indeed it has been mentioned to me more than once in the course of conversation, that a few Protestant children in a Roman Catholic national school might be perfectly protected from any attempt to interfere with their religion on the part of the teachers, but that no regulation could neutralize the effect of association with Roman Catholic children.

National convent school.

411. The convent school is conducted by nuns of the Dominican order, who also maintain a school of a higher class which is not in connexion with the National Board. The poor school is held in a large building detached from the convent, and which can be approached without passing through the ground in which the convent stands. The school is divided into three branches, an infant school, a school for girls who have passed through the infant schools, and another for girls who have come to school in a state of ignorance, and at an age too advanced for the infant school. This arrangement is in some respects excellent, as I have frequently found in large schools of this kind, that a class of little children contained a few girls of much greater age than the rest, and who were generally the most ignorant of the number. Not uncommonly these great girls had been placed in a class far too advanced for them, simply in order to save their feelings. All the school-rooms were good, and though well filled were not at all over-crowded. They were well provided with school furniture, and kept in excellent order. The proficiency of the girls whom I examined was not as great as might have been desired. They were decidedly inferior to most girls of the same standing in writing, spelling, and arithmetic. I selected the two higher classes in the upper school, which might have been expected to contain the best scholars, so that their unsatisfactory state argues ill for the efficiency of the rest of the school. I was unable to see the report book in which the daily attendance is registered. It was doubtful whether the roll had been taken, though the hour at which it ought to have been done was past, and no one seemed to know what had become of the books. The school, generally, seemed to want organization, and a more efficient staff of teachers. The number of children present when the police counted the attendance was 592, 340 girls, and 252 infants, all of them Roman Catholics.

Monkstown parochial school.

412. Kingstown is situated in the parish of Monkstown, but there are two parochial schools situated in the district, one at Monkstown and the other at Glasthule; the latter is in the district attached to the church at Kingstown, known as the Mariners' Church. Both are in connexion with the Church Education Society. The Monkstown school contains separate departments for boys, girls, and infants; the infants' school is not held at the same place as the others, and has no connexion with them, except that the manager is the same for all the schools. I visited the boys and girls' schools only. They are held in a large building near the church, containing a residence for the teachers as well as the two school-rooms. These are very good and well supplied with furniture; but the passages by which they are approached were very sensibly deficient in ventilation. The number of scholars on the roll of each school was the same—eighty-three, all Protestants; the number present in the boys' school twenty-eight, in the girls' school twenty-three; the corresponding numbers

returned by the police were twenty and twenty-one. I examined half the scholars in each school, including the two higher classes, the third and fourth. The boys wrote well, the girls fairly, from dictation; in arithmetic the boys were rather more advanced than the girls, but their work was not at all more accurate. Both boys and girls did fairly in this subject. History and geography were learnt, the latter with more success than the former. On the whole the school seemed to be fairly efficient; the boys' department in particular seemed to be in a satisfactory state. The master and mistress were married, and occupied the school-house. Their joint salary, including the master's stipend as parish clerk, was £80. Gas and fuel were provided for them. The master had been trained in the National model schools, but the mistress had received no special training.

Glasthule parochial school, visited in the company of the Inspector of schools in union with the Church Education Society.

413. I visited the school at Glasthule in company with the Rev. H. Hamilton, Inspector of the Church Education Society, when he made his annual inspection of the school. He kindly furnished me with a copy of the report which he made to the Society on the school; this will be found in the appendices to my report, and shows clearly what sort of supervision the Society exercises over schools in union with it. The buildings were very fair and quite sufficient for the number of pupils assembled. There are two rooms, one for boys the other for girls and infants. Fifty-three boys were present in the former, thirty-seven girls in the latter. At the visit of the police five days before ours forty-six boys, twenty-two girls, and eighteen infants were present.

414. Mr. Hamilton examined the lower classes in the girls' school very rapidly, promoted many of the scholars to a higher class, and then dismissed all the children. He then sent for the two higher classes from the boys' school, united them with the corresponding classes in the girls' school, and made them read the parable of the tares verse by verse. Their Bibles were taken away and they began to write the parable as well as they could from memory, with such an interpretation of it as they could invent or remember. Whilst they were thus engaged Mr. Hamilton examined the younger boys and made a large promotion. It should be noticed that a small gratuity is given to the teacher for every scholar promoted. The examination of these boys was as rapid as in the case of the same class of girls, and I could form no opinion of the amount of knowledge which the children possessed. As, however, the children remain at school long enough to reach the higher classes, the proficiency of the scholars in them is a sufficient test of the usefulness of the school. After the little boys had been dismissed the higher classes of boys and girls were called upon to show what they had written. They stood up in class and read in turns what had been written on the slates. The account of the parable they gave was very good and contained less imitation of Biblical language than I should have expected. Their comments were not very closely connected with the subjects, but consisted of vague generalities expressed in the ordinary language of sermons. Indeed I could not but think that the recollections of previous Sundays had supplied the material of most of the compositions. I should like to have seen the actual writing on the slates, but Mr. Hamilton seemed to think that any interruption of the ordinary course of the examination was undesirable. He afterwards read a list of words for them to spell, which most of them succeeded in writing correctly; but an exercise of this sort is not a good test of habitual accuracy in spelling. Long passages from Scripture were then repeated, and questions on other portions of Scripture which had been specially prepared were answered readily and well. The handwriting of the scholars was supposed to be sufficiently tested by an examination of the copy books, whilst they were working sums which Mr. Hamilton proposed. The last sum given was an example of compound long division, which two-thirds of the scholars finished correctly. Some elementary questions on geography and grammar, which were answered with intelligence, would have concluded the examination had not the schoolmaster obtained permission to ask some difficult questions in all subjects, in order to show the proficiency which the best pupils attained. One or two of the boys gave a fair explanation of the meaning of the terms longitude and latitude, and calculated the difference in time between two places whose longitudes were given, without understanding, as far as I could judge, the principle of the method they adopted. The impression which I received from this part of the examination was, that some of the more promising scholars had acquired a good deal of miscellaneous information, but it was not possible to estimate the real value of their knowledge. The school was considered by Mr. Hamilton to be one of the best of those in connexion with the Society, and my experience leads me to think that his opinion is just.

Stillorgan parochial schools.

415. The Stillorgan schools were mentioned to me by Mr. Hamilton as especially worthy of a visit, but he did not accompany me on this occasion. The schools contain separate departments for boys, girls, and infants. The two former occupy rooms which form part of the same building; the last is in a separate building. The boys and girls' schoolrooms were both of them excellent and in admirable order. The accommodation was sufficient for a considerably larger number of children. The number of scholars present in each school was the same—seventeen, all of them Protestants; the numbers returned by the police were, for the boys' school twelve, and for the girls' school nine. In both schools the scholars were more successful than usual in writing from dictation, but their knowledge of arithmetic was very limited and inaccurate, though not below the average of parochial schools. The infant school wanted ventilation, and was rather crowded; many of the children in it might have been transferred to the other schools with advantage, as they were far too old for an infant school. Children were kept in the infant school until they were able to read a book of the same difficulty as the Second Book of the series published by the National Board, and in consequence some of the infants were of tolerably mature age. In these schools unusual efforts were made to procure regular attendance, and prizes of books or clothes were annually given to the pupils who had attended the school most regularly. Books were the rewards preferred by most of the children, so that it may be easily believed that their condition was far removed from poverty. The number of teachers was three, one in each school; they had all been trained in the Church Education Society's school in Kildare-place. The salary of the schoolmaster was £40, including his stipend as parish clerk. The salary of the girls' schoolmistress was £24, and of the infant schoolmistress £21. A residence, with fuel, was provided for each of the teachers.

PART III.

Workhouse Schools.

416. I have now concluded the account in detail of my examination of ordinary schools, situated in the district assigned to me. There still remains one class of schools of which I visited a few specimens, but which are not intended for the population in general—workhouse schools. These are attended by children living in the workhouses only, and therefore, in constructing the tables which show the numbers of children actually at school, I have taken no account of workhouse schools. As the inmates of public institutions in which workhouses are included, form a class by themselves in the Census returns, any error in estimating the proportion of children of school-age actually in attendance at school by excluding those attending workhouse schools was avoided by omitting the inhabitants of public institutions from the sum of the population. Workhouse schools, attendance in them not included in the preceding tables.

417. The workhouse schools which I visited were situated at Naas, Drogheda, and in Dublin, where there are two workhouses.

418. All these schools, except the South Dublin workhouse school, were in connexion with the National Board. Grants of books were made to them on condition that the rules applying to non-vested schools were observed, and the Inspectors or other officers deputed by the Board freely admitted. No further assistance was given, the teachers' salaries, and other expenses connected with the school were borne by the rates.

419. I visited the school at Naas, but did not examine the children. The rooms were large and well appointed, very superior to the ordinary National school-rooms in every respect. In one room the girls and infants were collected, in the other the boys. The number of girls was fifty-five, and of male infants fifteen; the number of boys thirty, all of them Roman Catholics. None of the children were very old, and in this respect the school differed from all other workhouse schools which I saw. I understood, however, that when they were old enough the boys were sent to work in the fields for a portion of the day, and the girls engaged in household work. In the girls' school were two teachers, both of them classed according to the regulations of the National Board; the principal teacher was paid £25, the assistant £12, annually. The schoolmaster had no assistance; he also was a classed teacher; his salary was £30. All the teachers lived in the workhouse free of expense, but the children were considered to be under their charge out of school hours. The school was entirely separate from the rest of the workhouse, and the children were not allowed to leave their part of the building. Many of them, I was told, were orphans, or had been deserted by their parents. Naas workhouse school.

420. The school at Drogheda was, in many respects, like the last-mentioned school. The rooms were large, airy, and well furnished, but some of the scholars were much older than those in the school at Naas. The rule here was to keep both boys and girls in the school until they were fifteen years old, and then to transfer them to the adult ward. The school-hours were different from those generally adopted. Work in school lasted from nine o'clock until one, and the rest of the day was spent by those boys who were old enough in field work, and by the girls in household work. Many of them become habitual paupers; they leave the house for a short time, and finding life outside more disagreeable than they expected, return to the place which is to them their home. Their early life and education in the workhouse effectually prevents any such feeling of repugnance to the life of a pauper as is common among the poor who have not entered its walls. The children who have parents in the house, and who follow their parents in their frequent departures from the workhouse, return to it as hopelessly pauperized as those who always remain in the house, and lose the advantage of the education which regular attendance in the school affords. Drogheda workhouse school.

421. In the boys' school thirty-eight scholars were present, with one exception, all Roman Catholics. Eight of them were in the third class, the rest had not advanced so far; a larger number of boys ought to have reached the higher classes in a school like this, where the attendance is so much more regular than in ordinary schools, and where the boys remain to so late an age. The proficiency of the boys whom I examined was, however, unusually great. They wrote from dictation, and worked sums on paper for the first time in their lives, yet the results were very superior to those which I was accustomed to obtain. The boys were able to spell correctly and write legibly; their arithmetical work was in general correct, and quite as quickly done as in other schools. In the girls' school, thirty-five girls and four little boys were present; all of them Roman Catholics. Ten had reached the third class, and though not quite equal to the boys, were very superior to most girls of the same standing in ordinary schools. It should, however, be noticed that both boys and girls in this class were of considerable age; three of the boys were fifteen years old, and only two under eleven years; four of the girls were above twelve, and only three under ten years of age.

422. The schoolmaster had been trained in the model schools, and was in the second division of the third class; the schoolmistress had also been trained, and was in the same class. Their annual salaries were £25 and £20 respectively, and in addition to this they lived free of expense in the workhouse.

423. The schools of the North Dublin Union workhouse are divided into distinct establishments. The girls' schools are at the workhouse in North Brunswick-street, the boys' are situated in the suburbs of Dublin. The buildings of the latter are merely wooden sheds, which were used as habitations during one of the severe attacks of cholera which the city has suffered, and afterwards were taken by the guardians of the North Dublin union in order to relieve the crowding in the workhouse. The school accommodation consisted of three rooms which communicated by folding doors and could be thrown into one large room. They were very hot but fairly ventilated and not at all crowded, as the space was sufficient for 280 scholars, and the number actually present was only one hundred and fifteen. The furniture was sufficient and good, in fact everything had been done to make the rooms fit for their purpose, but without overcoming the radical defects of such a building. Still many ordinary National schools are worse lodged. The number of pupils on the roll, that is, the number of boys actually living in the house was 143, but some of them were absent from the school and at work when I made my North Dublin Union schools. Boys' school.

visit. The master told me that all boys above the age of twelve were kept in the school during half the day only; the rest of the time was spent in teaching them some trade. After the age of sixteen had been reached the boys were no longer retained in the school, but were transferred to the adult ward, unless some means of employment could be found for them. This, however, could seldom be done, as boys from the workhouse found it almost impossible to get masters to take them, and, in consequence, many of them became habitual paupers whilst they were still young. Others, who do succeed in getting work often return to the house in order to lead a life of comparative idleness. Some enlist, or go to sea, and they return to the workhouse less frequently than any others. The schoolmaster told me that the prejudice against workhouse boys was not altogether groundless. They were unaccustomed to really hard work, and were neither willing nor at first able to exert themselves in the same way as other boys who had been used to hard labour from a much earlier age. The education given in the workhouse schools is good enough to fit the boys for situations requiring something more than mere manual labour, but very few persons are willing to trust such boys; and thus these means of gaining an honest livelihood are unavailable. The prospects of these boys appear to be almost hopeless. No one could fail to notice the difference between the appearance of the scholars in this school and of the scholars in ordinary schools. Here the boys showed none of the signs of want and destitution, but they had a dull and almost brutal look, which I noticed nowhere else. About three-fourths of the whole number were orphans or deserted by their parents; the rest the children of paupers resident in the house. Nearly one-third of the boys present had reached the third class. Six were in the fourth class, but they were older than the rest. The boys could write and spell better than most boys of the same standing in other schools, and their arithmetic work was better; yet they seemed much less quick and intelligent than the boys usually met with in schools. The number of teachers was three, two of them Roman Catholic the other Protestant. The head teacher had been trained in the model schools, and was in the third division of the first class. All the teachers were boarded and lodged free of expense in the workhouse. The head teacher was paid £45, the second £40, and the third £35 annually.

Infant school.

424. There was an infant school for boys, which I did not visit, in which, according to the return made by the police, ninety-one children were present. The girls' schools are, as I have said, a part of the workhouse itself. There are two school-rooms; the larger used by the girls' school, the other by the infants' school. The latter was not at all crowded and in excellent order. The children were well clothed, and seemed much better cared for than the children in the ordinary National schools.

Girls' school.

The girls' school-room was large, airy, and very well supplied with furniture. The number of scholars present was 106, of whom eight were Protestants; many were of comparatively advanced age, and a fair proportion had reached the third or fourth class. I examined the third class, which contained twenty girls, the youngest of whom was ten years old and the eldest fifteen. They could read well and write fairly; their spelling was not very correct, and their knowledge of arithmetic was limited; but they did not fall below the average proficiency of girls in the same class. Better results might have been expected in a school where the attendance of a large portion of the scholars is so regular.

425. The teaching staff was large, consisting of the schoolmistress and two classed assistants, besides two girls who acted as monitresses without being paid for their services. All the teachers were Roman Catholics. The principal teacher received £35, each of the others £30 per annum; they lived free of expense in the workhouse. The infant schoolmistress received £20 besides board and lodging.

426. The girls were, of course, far better clothed than most of the scholars in ordinary schools and showed no trace of poverty or want, but they seemed far less bright and intelligent. I was told that no great difficulty was experienced in providing the girls with employment when they became old enough to work. Soon after the age of fourteen most of them were sent out as servants, no objection being made to them on account of their pauper education. Many, however, afterwards returned to the workhouse either because they did not like work or when they had left one place and were waiting for another. More than half of the girls were orphans or deserted children; the rest came into the house with their parents and left it again, commonly remaining out for very short periods only. To girls of this class, of course, the remarks just made do not apply.

South Dublin Union schools denominational.

National system of instruction adopted in the Roman Catholic school only.

427. The schools of the South Dublin workhouse are not in connexion with the National Board and are denominational, at least to such an extent that separate schools are provided for Protestants and Roman Catholics. The number of schools in the system is eight: an infant school for Roman Catholics of both sexes, a senior and junior school for Roman Catholic boys, and a school for Protestant boys of all ages, a senior school for Roman Catholic girls, two junior schools for Roman Catholic girls, and one school for Protestant girls of all ages. The National school books are used in the Roman Catholic schools, and the programme issued by the Commissioners is used to regulate the course of instruction; but in the Protestant schools the books used are the same as those commonly found in parochial schools. The Roman Catholic teachers had been trained at the National model schools, the Protestants at the Church Education Society's schools in Kildare-place. The two methods of instruction are here in operation under very similar circumstances, and an excellent opportunity is afforded of estimating their relative efficiency. It should, however, be noticed that although the children in the two sets of schools are of the same age, and living in the same place, yet the Protestant children are constantly changing, whilst most of the Roman Catholics remain in the house. Thus the Protestant teacher has to contend with the difficulty of irregular attendance which scarcely affects the Roman Catholic teachers. On the other hand, the proportion of teachers to pupils is very much larger in the Protestant schools than in the Roman Catholic schools. . All the school-rooms were very good and well supplied with furniture. The Roman Catholic schools were more crowded than the others, but in them there was space for more scholars.

Roman Catholic infant school.

428. The Roman Catholic infant school contained 120 children of both sexes and of all ages between two years and a half and seven years. The schoolmistress was assisted by three monitresses, who were chosen from the other schools, but were not paid for their work. The proportion of teachers to children is smaller in this school than in ordinary schools, but the children evidently did not suffer from want of care.

429. The junior girls' schools had been recently formed; the girls in each were of the same standing and age, and were only placed in separate schools because their number was so large. Formerly they had been divided according to their proficiency, but the present arrangement had been adopted with the hope of exciting some emulation between the teachers and scholars in the two schools. The number of scholars in one school was sixty-one, and in the other sixty-eight. In each one classed teacher conducted the school without any assistance except from monitresses who were not paid for their work. Some of the girls in each school had been placed in the third class, but fell short of the standard required in the programme. Their writing and spelling were indifferent, their knowledge of arithmetic limited and their work incorrect. Roman Catholic junior girls' schools.

430. The senior girls' school contained scholars in the fourth and fifth classes only. The girls in the higher class were not at all superior to the others as far as I could discover, and certainly all were inferior to girls of the same standing in ordinary schools. This was the case, notwithstanding the greater age of the girls in this school. Their writing was very bad, but for this the teacher alone was to be blamed, for she made them practise an illegible angular hand which she considered good; their spelling was very bad, but they were more successful in arithmetic. The number of girls present in the school was thirty-six; all were more than twelve years old, and some of them more than fifteen. Roman Catholic senior girls' school.

431. The Protestant school was almost the worst I ever examined; the girls read badly, wrote badly, could not spell, and were very ignorant of arithmetic; yet some of them were by no means young. The number of girls present was thirty, of all ages, from two or three years to sixteen. Protestant girls' school.

432. The Roman Catholic boys' schools were much like ordinary National schools of the same kind. The junior school contained boys in the first class and a few in the second, the senior school the rest. The number present in the junior school was ninety-four, of whom seventeen were in the second class. The teacher was assisted by two monitors who were not paid for their work. In the senior school sixty-six boys were present, of whom thirty were in the third class, and nineteen in the fourth. Some of them were more than fifteen years old, and none appeared to be less than eleven or twelve. The boys in the fourth class wrote well, and were able to spell tolerably; they worked sums in practice readily and correctly, the most satisfactory of all those which I examined. The schoolmaster was assisted by three unpaid monitors. Roman Catholic boys' schools.

433. The Protestant school was better than the girls' school, but not equal to the Roman Catholic boys' school. The boys in the highest class could write, but their spelling was bad; they had learned a little arithmetic and were able to work sums in the four simple rules correctly, but were not so successful with examples of the compound rules. The number present was twenty-one; the eldest boy was only fourteen years old, and some were little more than infants. The teacher was assisted by one unpaid monitor. Protestant boys' schools.

434. The salaries of the male teachers were equal, £35 a year; four of the female teachers received £25, but the teacher of the infant school only £20. They all lived in the workhouse free of expense, but were expected to take charge of the children at all times. Salaries of teachers.

435. The master of the workhouse gave me much the same account of the scholars in these schools as I had heard at the other schools. He said that the number of boys and girls who remained for a short time in the school was large, and their consequent irregularity in the attendence at school prevented any satisfactory progress. The Protestants, as I have already mentioned, were especially remarkable for the brief period during which they remained continuously in the workhouse.

436. These schools were certainly less efficient than those of the North Dublin workhouse, and the cause of the inferiority can, I think, be easily assigned. In these schools the proportion of teachers to children is much smaller than in the others, and the number of children who live permanently in the workhouse is a smaller fraction of the whole number present at any time. Thus the teachers have at once more children to teach and worse material to work upon. The arrangement of the schools adopted does not allow the teaching power to be used in the most efficient manner. The boys' schools, for instance, are divided into three distinct schools, each under a separate teacher. One teacher has eighty boys under his charge, another 100, and the third only twenty. If the smaller school were combined with either of the others, the two teachers would be able to conduct one school of 100 or 120 boys much more efficiently than the single teacher can now manage the school of 100 boys. In the girls' school also a combination which would allow two or more regular teachers to be present in the same room, would render the efficient performance of the work of teaching much more attainable. This method is adopted in the North Dublin schools. In the boys' school three classed teachers were provided for 115 boys, and they were all present in the same room so as to be able to give the greatest assistance to each other in the work of teaching. The arrangement in the girls' school is the same, only the proportion of teachers to scholars is larger; three teachers for 106 scholars. The North Dublin schools are visited by the Inspectors of National schools; the South Dublin schools have no such advantage. Comparison of these schools with the schools of the North Dublin Union.

437. This concludes the account of the schools which I visited in the course of my inquiry. I have endeavoured to give a plain narrative of facts which I observed, uncoloured by my own opinion. The result will I hope, enable the reader to form a just estimate of the sufficiency of the existing means of educating the poor in those districts to which my report relates.

438. The appendices which follow contain some important information relating to particular schools, and a collection of answers to a circular of questions which I sent to all persons living in the district who were likely to be interested in the subject of education. Much of the contents has been embodied in my report, but the original documents are, in many cases, worthy of study.

439. It only remains for me to express my sense of the courtesy which was shown me by all persons with whom I was brought in contact in the course of my inquiry. I must notice especially the assistance which the teachers of schools gave me in the work of school examination, and the readiness with which they supplied me with all information that I desired.

I have the honour to be, my Lords and Gentlemen, your obedient servant,

THOMAS KING.

Appendix I.

The following circular of questions with which I was supplied from the office I sent to all persons whom I thought likely to be able to give useful information on the different subjects mentioned.

The answers were not very numerous; all which extend beyond a few words are subjoined.

1. The means of education in your neighbourhood. Are they sufficient for the poorer classes?
2. Reluctance of parents to avail themselves of the existing means. When it exists is it due to the distance of schools, the amount of school-fees, want of confidence in the teacher's skill, religious and conscientious objections, inability to forego children's wages, or any other cause that you can assign?
3. Industrial occupations that prevail in your neighbourhood, and their effect on school attendance.
4. Plans for securing increased or more regular attendance.
5. Local aid that may be expected in providing proper and efficient schools.
6. Government aid. Is it ever abused or misapplied?
7. Comparison of schools aided by the State or unaided, in reference to efficiency.
8. Mixed education, *i.e.*, education of children of different religious denominations. Is it beneficial or otherwise?
9. Gratuitous education.
10. Schools for boys and girls. Is the popular feeling in favour of the head teacher being a master or a mistress?
11. Evening schools.
12. Ragged schools.
13. Infant schools.

On any one of the questions suggested, or on any subject connected with the question of primary education, I shall feel obliged by the full expression of your views.

From the Very Rev. J. Spratt, D.D., Patron of St. Peter's, Whitefriar-street, National Schools.

1. There seems to be sufficient school accommodation for the children in attendance.

2. There is no reluctance on the part of Catholic parents to send their children to schools under the management of the Catholic clergy or the Catholic religious bodies. They would not be willing to send them to schools under Protestant management, even to National schools. Beyond this I am not aware of any *reluctance* on the part of parents to avail themselves of the existing means of education; but there is frequently inability or indifference. The inability arises from poverty, consequent upon the often recurring want of employment. When the parents cannot find employment, as so frequently happens, and in some trades at certain intervals and for long periods, they are obliged to keep the children at home for want of clothing, and not unfrequently on account of insufficiency of food.

The apathy of the parents arises mainly from their own ignorance, in the first instance, and secondly, from their not perceiving any immediate benefit to be derived from education *in their humble callings*. No doubt, bad habits also are engendered when they are obliged to keep their children at home through poverty, so that, even when they again find employment, they do not avail themselves of their opportunities as promptly and punctually as if there had been no interruption.

3. The introduction of sewing and other machines has caused the withdrawal of a number of young girls at an earlier age than was hitherto customary, owing to the *immediate* remuneration given, no lengthened apprenticeship being necessary. This has the effect of allowing a much smaller number of children to attain to the higher classes in the female schools. With this exception the industrial occupations of the neighbourhood are only those of the ordinary trades, to which children are not put until the usual age, for serving their apprenticeship.

4. Two modes suggest themselves—the hope of reward and legal compulsion. There remains little to be done to render the schools attractive, while there is, as a rule, nothing to make them repulsive or objectionable; so that, speaking at least for the city, little can be done by local parties to render the attendance larger or more regular. To offer rewards to the parents for sending their children to school would entail enormous expense, not to speak of other and more objectionable results. One, then, naturally falls back on the power of the law. It is dangerous to have recourse to legal assistance to make parents avail themselves of so great a blessing as education; but when one walks through the streets of Dublin and sees crowds of children lying about idle, during school-hours, hearing and seeing everything from which they should be carefully guarded, getting, in fact, trained in vice, while their neglectful parents can offer no reason whatever for keeping them from school, it seems wrong to allow such a power for evil to rest in the hands of unforeseeing people. And indeed it must be admitted that such a law would not be a greater interference with individual freedom and parental right than many already in existence, such as Vaccination Act, Factory Act, &c.

5. Very little local aid may be expected in my neighbourhood in providing proper and efficient schools.

6. No such abuse or misapplication has come under my notice.

7. The principal schools attended by the Catholic poor, of which I am able to speak, unaided by Parliament, in the neighbourhood, are the Christian Brothers' schools—to the efficiency of whose system such high testimony has been borne, that it is almost unnecessary for me to add a word in its favour. It is to be noted regarding these schools, that they not only enjoy that confidence of the parents which is accorded to all schools conducted by the Catholic religious bodies, but, that their system of secular instruction seems to commend itself specially to the approval of the parents. I attribute this to the fact, that the Christian Brothers have aimed specially at giving effective instruction in the essential branches, reading, writing, and arithmetic, confining their junior classes to these subjects, and not extending their course until the children arrive at the higher classes, when, if their parents can allow them to remain at school, they are introduced to a more extended course. This system it must be admitted secures to the pupils solid instruction in the essential branches, and I think the parents like to see that done. In the National schools an opposite course is taken, the children, even when mere infants—being introduced to the abstruse subjects of English grammar, to geography, and many other branches. Another and the principal advantage which the Christian Brothers' schools possess over the National schools is that being unrestricted by any rule forbidding reference to religion during the hours of secular instruction, they are able to pursue a constant and unceasing system of moral and religious training of their pupils, check a tendency to any vice by the most effective means—the motives and aids of religion, and obtain a moral control over their pupils which is not permitted to the teachers of a National school, all of which tells on the tone of the school, and tends to render it efficient and popular.

8. In the city of Dublin there is practically no mixed education *outside* of the *model schools*. Each religious denomination has its own schools, and the parents of one denomination will not send their children to schools under the management of another; thus, in my neighbourhood the Catholic parents would not send their children to St. Bride's National school, because it is under the management of the Protestant Rector (otherwise one of the most popular and charitable gentlemen in Dublin), whilst on the other hand Protestant children are not sent to my schools. We are indeed *hampered by a code of rules* constructed for an imaginary mixed attendance, but in fact the schools are purely denominational. With regard to mixed education I would refer you to the resolutions presented by the Catholic hierarchy to Mr. Cardwell, when Chief Secretary for Ireland, as embodying the views of the Catholic clergy of Ireland.

9. In all cases in which the circumstances of the parents enable them to contribute towards the education of their children, I think payment should be enforced, as it tends to make them take a greater interest in the progress of their children, to see that they prepare their lessons at home, and attend school constantly and punctually. But I should be sorry to see the children deprived of the means of education on account of the poverty of their parents.

10. There are no such schools in the city of Dublin, except *infant schools*, in which, on account of the tender age of the children, female teachers are decidedly preferable.

11. Evening schools, have not on the whole, perhaps, been very successful—but no doubt they have a great many difficulties to contend with. I am not prepared to say that under very judicious management, and with adequate means of instruction some might not be carried on with advantage to the young men of the city. At the same time, as our boys are generally left at school till a tolerably advanced age, they do not stand so much in need of instruction as they would in a factory district, where there is a demand for labour at even the earliest age. This absence of manufacturing enterprise perhaps supplies another reason that evening schools are not so much required here—namely, that there are not so many opportunities for advancement to artisans having superior information on special subjects, and consequently no motive for the acquisition of such knowledge. I do not know that there are any evening schools for females in existence here. I should consider such decidedly objectionable.

12. There is, no doubt, a great deal of poverty among the class from which the children attending the National schools are drawn, and assistance in the form of food, and occasionally clothing, is often very much needed. But the parents have a decided aversion to availing themselves of ragged schools for the purpose of receiving such aid. They feel the distinction humiliating and degrading, especially when this distress is but temporary. It might be possible to give such assistance through the medium of the ordinary National schools, and it would doubtless induce greater regularity of attendance.

13. Infant schools may be regarded as an absolute necessity in the city. They serve to preserve the children from the numerous physical and moral dangers of the streets—affording them amusement and such instruction as their years admit of, while at the same time they relieve the parents from a troublesome and embarrassing charge, leaving them free to pursue their various avocations or attend to other domestic duties.

A few years ago infant departments were very rare, but so thoroughly have they been appreciated by the people that they have been added to nearly all the parochial and other National schools in Dublin, and are everywhere well attended.

John Spratt, D.D.

From the Rev. W. Purcell, C.C.

Sir,—In reply to your communication I shall endeavour to give you all the information in my power. I speak only of the neighbourhood of St. Patrick's schools.

1. I think the means of education are scarcely sufficient for the very poor, so numerous in and about Mecklenburgh-street.

2. Many parents do not send their children to school, because of their poverty and nakedness, many are exceedingly careless, and this arises sometimes from slothful habits, sometimes from drunkenness—now and again children cannot go to school, as they have to mind infants, go of messages, attend to sick brothers and sisters, but very frequently they "mitch." The school is very central. The very poor are admitted gratuitously, no fee asked. The teachers are industrious, attentive, and kind to the children.

3. There is no factory or place of that kind near the school. There is no industrial occupation for children under twelve or thirteen years of age.

4. Plans for securing increased and regular attendance might be the securing of employment for parents, getting clothes, and even breakfast for the more needy children. We have not means to do these things.

5. As to local aid, the people are ever giving charity. Through the goodness of the poor, and by "penny a week" collections, we succeeded in building St. Patrick's, and in supporting them until we placed them in connexion with the Board of National Education.

6. "Government Aid."—We get no aid from Government except the salaries for the teachers, who are poorly paid. There is no misapplication or abuse in disbursing this money.

7. Comparison, &c. I believe the Christian Brothers' schools, unaided by the State, as also some convent schools similarly circumstanced, rank higher as to efficiency than the schools aided by the State, with perhaps a few exceptions. Yet, I cannot see why schools aided by the State *cæteris paribus* would not rank as high in efficiency as other schools, and higher too.

8. "Mixed Education."—It is not suited for the proper instruction of our children. Denominational education is preferable; because religion, which is the groundwork of proper education, has its true position in the denominational system, and the fear of proselytism is removed.

9. "Gratuitous Education."—In such a wretchedly poor locality as Lower Mecklenburgh-street, the majority of the children, *the great majority*, must be taught gratuitously.

10. "Schools for Boys and Girls."—Except in infant schools, boys and girls should be educated separately. It is not a correct thing to have grown girls taught by a master in National schools, nor grown boys taught by a mistress, unless she have attained a certain age, or be a married woman. Whenever such must be done, as in some country parts, if the teacher be a prudent man and married, I believe the feeling is in favour of a male teacher.

11. "Evening Schools."—Such would be very desirable for boys and girls whose education was neglected in youth, or who have to earn a livelihood during school-hours in the day time.

12. "Ragged Schools."—The term is insulting to the poor. There must be poor schools in a city where there is such distress and such a want of employment.

13. "Infant Schools."—These, to my mind, are the most important of all schools. The proper training and moulding of the children at a very tender age, when the mind is open to good impressions, are of the first importance. If infant schools are well managed they lay the foundation of future good.

I have thus roughly given you my views. They are merely local, and they are the results of my limited experience.

I enclose a reply regarding local support received.

I have the honour to be your obedient servant,

William Purcell, C.C., Marlborough-street.

7th October, 1868.

From the Rev. W. Murphy, C.C., National Convent Schools, King's Inns-street.

Presbytery, Marlborough-street,
October 21, 1868.

Sir,—May I beg you to excuse me for having so long deferred to forward to you the answers which I have deemed it incumbent to give to the inquiries made by you in the sheet sent to me and which I now return.

1. The means, though considerable, might, if under proper supervision, be enlarged with advantage.

2. The reluctance of parents arises chiefly from their conscientious objection to place their children under the care of a teacher not of their own religion. It arises sometimes also from the difficulty found to exist in convent schools in procuring the classification which the acquirements of their children would easily obtain for them in model schools.

3. As no factories are in this immediate neighbourhood children are not kept from school by the occupation they afford.

4. The plans existing are the interest and vigilance exercised by the conductors of schools in inducing the children to attend and in endeavouring to get parents to second their efforts.

5. Already the Catholic population of the district are too heavily taxed for educational purposes.

6. Not that I am aware of; unless the vast sums spent on model schools, sums wholly disproportionate to the number of children attending them, are to be considered misapplication of public money.

7. Comparing the National schools with which I happen to be connected with those in the district not having Government aid the efficiency of the former is decidedly superior to that of the latter. This observation refers exclusively to the few female schools in this district, which are not connected with the National Board. The admirable boys' schools under the care of the Christian Brothers in this locality far surpass in every respect any National school of which I have any knowledge.

8. Mixed education is certainly not beneficial.

9. The education in parochial schools is, to a great extent, gratuitous, owing to the inability of parents to pay school-fees for their children.

10. Popular feeling would seem to be in favour of having teachers of both sexes in schools frequented by boys and girls.

11. Evening schools for girls, when under the care of ladies of a religious order, are productive of the best results to a class who are unable to go to day schools.

12. I have no experience of ragged schools.

13. Infant schools wholly indispensable.

In reference to query 4 it occurs to me to observe that the carrying out of any plan that would provide a residence for the teacher near the school would greatly tend to make children attend in larger numbers and with more regularity.

I have the honour to be your obedient servant,

W. Murphy.

From the Rev. J. Gaffney, S.J., Patron of St. Francis Xavier's National Schools.

Presbytery, Upper Gardiner-street, Dublin,
27th July, 1868.

Sir,—In reply to your circular of the 25th instant, on the subject of primary education, I have only a few observations to make, but shall be happy to afford you any information you may require with regard to the National schools under my care. I am of opinion—

1. That the means of education in this immediate neighbourhood are sufficient for the poorer classes.

2. That the attendance of children might and ought to be greater.

3. That the non-attendance of the children is chiefly to be attributed to the neglect of the parents.

4. That a good plan for securing increased and more regular attendance would be a proper distribution of rewards given to the children according to their attendance during the year, or half year, which would be easily ascertained by reference to the rolls in each school.

I have the honour to be your most obedient servant,

T. King, esq. John Gaffney, S.J.

From the Rev. C. L. Grant, Wesleyan Minister, Manager of Lombard-street National School.

8, Lower Abbey-street,
27th July, 1868.

Dear Sir,—I am in receipt of your circular of inquiry respecting primary education in Ireland and have pleasure in submitting my opinions on some of the points suggested. I should premise that by the usages of the Wesleyan Methodist Church ministers are changed from one place to another, at farthest at the end of three years, so that my answers cannot have an exclusive reference to any particular locality. As I have been twenty-two years a minister, and during that time occupied stations north, south, and centre of Ireland, for many years a member of the Education Committee, and taken a deep interest in everything touching primary education in Ireland, I may perhaps, claim some acquaintance with the subject. I shall take the inquiries in order.

1. So far as I know the means of education are sufficient in my present neighbourhood.

2. I have only known children to be kept from school from two causes; first, the extreme poverty of the parents, being unable to pay any

amount of school-fees; second, from the prodigality of parents, and their consequent indifference to the future well-being of their children. No instance occurs to me in which even the poorest members of the Methodist Church neglect the education of their children.

3. I am not aware that the industrial occupations of this neighbourhood prevents, in any measure, school attendance.

4. A compulsory system, with entire exemption from payment in cases of extreme poverty, are the only plans which I can suggest.

5. My experience is that local aid cannot to any extent be relied on, and that a much larger amount of Government aid is imperatively required. One special requirement is a large increase to the salaries of teachers.

6. The only tendency to abuse or misapplication of Government aid which I have known has been an endeavour on the part of certain religious communities to make Government aid to schools a direct or indirect means of promoting the spread and influence of their own peculiar views.

7. In my judgment the schools aided by the State, taken as a whole, are much more efficient as regards apparatus, method, fitness of teachers, and education given, than the schools maintained by the several religious denominations.

8. I am strongly, very strongly, in favour of mixed education. In my judgment the bane of Ireland is the intense zeal for creeds and forms of worship as such which prevail in this country. A spirit of exclusiveness in business, of general distrust, of religious hatred, are the results even now; but if this zeal were fed and fanned by the establishment of denominational schools, supported by the State, the evil would greatly increase. To unite the youth of Ireland during the period of education, whether in the college or in the village school, in my opinion would greatly contribute to the future peace and prosperity of the country. Primary schools, on the principle of the National model schools, or a purely secular system of education seem to be methods of most good and least evil for Ireland.

9. Am in favour of gratuitous education, at least for the working classes.

10. When the children of schools for boys and girls are advanced I think the popular feeling is in favour of the head teacher being a master; when the children are very young a mistress.

11. I have not any opinion on the subject of evening schools.

12. I am doubtful about the success of ragged schools as such in this country, but think the interest involved would justify an experiment.

13. The infant schools of the National Board are extremely popular and deservedly so.

The establishment by the Government of a class of schools intermediate between the National schools and the Queen's Colleges, in which ancient and modern languages as well as science would be taught, has for a long time seemed to me to be absolutely necessary to the completenesss of National education in this country, and also to the full efficiency of the Queen's Colleges. It would be difficult to overestimate the advantages which schools of this class would confer. The Royal schools do not answer the purpose desired. They are costly, denominational, and connected with Trinity College, Dublin, and their curriculum arranged accordingly. Other intermediate schools are either denominational, and therefore, unsuitable to a mixed community, or private, and therefore, too costly for the means of the lower grade of the middle classes.

Trusting that I have clearly expressed my views on the above subjects, and grateful for the opportunity of doing so,

I am, my dear sir, your obedient servant,

Thomas King, esq. C. L. Grant, Wesleyan Minister.

I asked Mr. Grant to explain his remarks in answer to question 6, and received the following reply :—

8, Lower Abbey-street,
28th July, 1868.

My dear Sir,—I am in receipt of your favour of the 27th instant and hasten to give you some explanation on the remarks you quote from my letter of the same date. You ask me to give you an instance of attempt to make Government aid a means of spreading religious opinions. Permit me to refer you to two books issued by the Commissioners of National Education in December, 1867, called the Second and Fourth Books, "revised," and thereby judge of the tendency of the teaching contained in the following extracts:

"Her *beads* while she *numbered*,
The baby still slumbered,
And smiled in her face as she bended her knee;
'Oh! blessed be that warning,
My child, thy sleep adorning,
For I know that the angels are whispering to thee;
And while they are keeping
Bright watch o'er thy sleeping,
Oh! *pray to them* softly, my baby with me.'"

—See Second Book, p. 180.

Again—

"Soon after the good lady *made the sign of the cross on her breast*, and having recommended to God the king and her youngest son, Thomas, who was present, gave up her spirit, which I firmly believe was caught by the holy angels and carried to the glory of heaven, *for she had never done anything by thought, or deed, that could endanger her losing it.*"—See Fourth Book, p. 171.

I have given the above extracts as specimens of the books named and underscored the parts against which every *Protestant* in the land will protest. Many of the pieces have attached to them the rather suggestive name of Dr. Newman. These books are the joint production (as compilers) of two Inspectors of National Education in Ireland, received the sanction of a majority of the Commissioners and the Lord Lieutenant, and cost the Government upwards of £3,000. You will judge what must have been the pressure used to obtain a result like this, and also whether it does not amply sustain what I have said of "an endeavour on the part of certain religious communities to make Government aid a direct or indirect means of promoting the spread of their religious opinions."

This was what I had chiefly in view in my letter of the 27th. I do not say it was the only thing I had in view, but as you asked me for "*an instance*" I have given this as one which you may search out without stirring up any bad feeling or placing individuals in painful positions; and I humbly venture to think you will see it is very suggestive.

With regard to the school under my patronage I think the average attendance is about thirty-five, but I am not very clear as to the exact figures. The time of vacation is fully expired but the school-room is being cleaned and painted and will not be finished till the end of this week. The delay is with the painter; he has taken two weeks longer than the agreement, and scarcity of work I believe is the reason why he has failed in keeping his contract.

I am, my dear sir, your obedient servant,

C. L. Grant.

Thomas King, esq.

P.S.—Perhaps I should add that in consequence of the remonstrances of some Protestant Churches in Ireland, the Commissioners have withdrawn the books complained of; but of course this does not, in the slightest degree, alter the fact; it is rather an admission on the part of the Commissioners themselves that the charge was well founded.

C. L. G.

From the Rev. R. H. Wall, D.D., Chaplain of the Royal Chapel of St. Matthew, Ringsend, and Patron of the Irishtown National Schools.

Irishtown.—Subjects of Inquiry proposed by the Commission of Primary Education in Ireland, 1868—Replies thereto.

1. I think they are—there are in the English town of Ringsend (or Ringsend proper) three schools, viz., boys', girls', and infant schools, under the National Board—the two former principally attended by Romanists—the last by Romanists and Protestants—and in the Irish town of Ringsend, where Her Majesty's Chapel of St. Matthew, Ringsend (commonly known as Irishtown Church), is situated, there are two, viz., a boys' and a girls' school, these are likewise under the National Board, principally attended by the children of Protestants. Lately there have been erected a school at Tritonville by the Presbyterians, and one at Sandymount by the Wesleyans. Of these last mentioned I am not able to say anything, having been unable since their erection, from delicacy of health, to take any active part in the affairs of the neighbourhood, farther than my own immediate duties are concerned when health permits, but I have no doubt they will be efficiently conducted.

Of the first five mentioned I consider they have been well managed, according to the views of the respective patrons—some Protestants occasionally are found to attend the boys' and girls' schools in Ringsend, and *vice versa* some Romanists attend the Irishtown schools, but this is generally a result from mixed marriages.

I would observe, however, that though all the schools of Ringsend and Irishtown are *bona fide* conducted in accordance with the rules of the National Board, as far as I could ever learn, yet, *practically* they may be considered denominational—the parents, through fear of interference with the religious principles of their children, or in many cases *without that fear*, but unwilling to act against the directions of their clergy, selecting the school prescribed by *them*.

On the whole, in reference to the subject of inquiry No. 1, the means of the neighbourhood *with the present aid* are sufficient, *without it* not, so far as literary education is concerned; but *industrial* education is sadly needed, and there is a wide field for it in these populous villages.

2. No one in this neighbourhood can complain of the distance of the schools.

When I came first to this neighbourhood in 1818, there was no school, except occasionally an attempt at establishing a private school by roomkeepers, and when after some time I attempted to build the house in which the Irishtown schools are now carried on, I could not procure in the neighbourhood a tenth of the sum required. By extern aid (collected I may say *undique* among my private connexions), the house was erected. Through the same channel the annual expenses were for some years maintained, and when this aid failed, it became necessary to close the schools until I got assistance from the National Board.

I should observe that the care of schools is unconnected with my official position as Chaplain of the Royal Chapel of St. Matthew, Ringsend—anything done in that way is *extra-official*; yet seeing the deplorable ignorance of the surrounding pauper population, I could not rest satisfied with confining myself to my actual duties. I collected as many children as I could, something between two and three hundred, out of whom not a dozen could read, and not double that number could say the Lord's prayer. Now, though most of the parents are anxious to have their children earning before they ought, yet very few of them leave school before they can read, write, and know something of arithmetic, and other useful matters usually taught in such schools. I have noticed, during a long experience, parents of all ranks, and none more than those least able to judge, express a want of confidence in the skill of the teacher, especially when the pupil wishes to leave the school, and assigns to the parent as a reason, that the "teacher does not know how to teach him," and *that*, perhaps, because said teacher requires him or her to evidence more diligence than he or she finds agreeable.

I do not believe that either here or in any part of Ireland the amount of school-fees required in National or parochial schools keeps any child away from school. On the contrary, the Irish undervalue any school, where education is given gratis. One penny per week (the fee required in National and parochial schools for primary education) deters no one that *wishes* to have his child educated.

I remember well the hedge schools in the country parts of Ireland, which were well attended in the wildest parts of the country, and where (notwithstanding the abuse which it has been latterly fashionable to heap upon them) a rough, but sound education was to be had. In these the fee varied from three pence to ten pence per week (according to the branches learned by the pupils), nor have I ever known an instance, in which the schoolmaster had to complain of being unpaid, though he were to let it run unpaid to the end of the quarter, or half-year. No, the humbler class of the Irish feel a pride in *paying* (no doubt as little as they can bargain for) for the education of their children; they *will not* have them called "poor scholars."

3. The only industrial occupations in the neighbourhood of Irishtown, which affects the attendance at the schools is FISHING. This often takes *boys* away altogether, or causes them to be irregular in their attendance. *Girls* are often kept at home to mind the house or rooms, and young children, while the mother is away on some industrial pursuit, or perhaps to bring their meals to fathers or brothers employed at work at some distance.

4. I have, when able to attend myself at the schools, tried many plans, but without success; nor do I see any that can succeed. The general bulk of the school pupils will, by good looking after, attend regularly, and must be taught in classes. To let some come or go away at one hour, and some at another for this or that call of *home duty*, would destroy the efficiency of any school. To meet such cases would require a distinct school-room, and distinct teachers; and, perhaps, even if such expense could be afforded, would not make matters a bit better.

The Sunday school, when they can be got to go to it, is the only remedy I see for this class for *girls*, and the night school for boys; but such persons are not easily induced to go to either. They generally acquire a *distaste* for learning.

5. I believe the only local aid that can be expected in the neighbourhood is already in requisition, viz., small private subscriptions and charity sermons.

6. I do not believe it is.

7. I have no hesitation in stating that it is my firm conviction, that (although it is not entirely what I would desire, yet perhaps as much so as the circumstances of the country will admit) the education afforded under the National Board, *through the aid of Government*, when fairly and honestly carried into operation, is the very best, that in my long experience I have anywhere met; and I farther volunteer an opinion, that, *under the modification of the rules*, for some years now existing, where the patron is so inclined, the pupils, whose parents desire it, can get as great an amount of Scriptural instruction, suited to their capacity, as reason or Scripture warrants the patron of any school to enforce. Where the parents refuse to have their children instructed in the Sacred Scriptures, I never could believe that either the State or the clergy of any denomination, have any right to force such instruction upon them. This, however, is very different from the rule, which at the first foundation of the Board (at least the interpretation of that rule), required the clergyman, if the patron of the school, to be the *instrument in turning out* the children from the room in which such instruction was being given.

While this duty of *driving away* any children was required of the patron, I declined seeking any aid from the Board, even though for want of funds I had to close the schools until I found the operation of the rule alluded to was so altered that it might be expressed in the words, "no restriction, no compulsion;" then I thankfully availed myself of the Government aid.

8. I myself believe that if the clerical element were more limited in its power of interference with the parents of the children, and the parents left to themselves to select the schools to which they would send their children, the system called "*mixed education*" is not only the best and most suited to the requirements of the country, but what nine-tenths of the parents of the humbler classes would prefer, and I am convinced that a patron of a school, of no extreme or party views, would be able to gather into his school that proportion of the children of all denominations. This view I hold from what very many of those who differ from me in religious opinions have often expressed to the following effect:—"We like the schools and the teaching, but you know we cannot go against our clergy." While this clerical interference is permitted, the schools will be practically denominational.

9. This answered in No. 2.

10. Not only in Irishtown, but as far as I know, the general feeling through all Ireland is so strong against having boys and girls meet for instruction, in the same room, that (unless in the Sunday school, and even there only when it cannot be avoided) it is only a matter of necessity arising from the poverty of the district that would cause parents to submit to have their children under the care of a teacher not of the sex of the pupils respectively.

11. Evening schools for young lads whose education has been neglected are of the greatest use, wherever they can be got up; but it is very difficult to induce those, for whom they are suited, to attend them; or a master who has been fagged in the day-school, to be efficient in the evening or night-school.

Against an evening school for girls there are insuperable objections. It would be likely to produce a vast amount of harm.

12. I have not had much experience of what *are called* ragged schools, but the very name is calculated to prejudice the parents *even of ragged* children in Ireland against them. In any of them that I have seen, the pupils were, nevertheless, far better clothed than many in the National or parochial schools.

13. I have had the experience of an infant school under my own patronage at Irishtown, for some years, and so convinced was I of its usefulness, that it was with great reluctance I gave it up, being unable to raise funds to support it, especially after the Hon. Sidney Herbert established one at Ringsend.

For an infant school I consider none but a female suited to be the teacher, and she (to be useful) should be of a respectable class, of good temper, great patience, and cheerful disposition, joined with steadiness and a natural love for children. Such a combination of qualities is not easily found in one person, and if found, in order to retain her, must be well paid.

The children, too, must be fed while at the school. All these requisites make infant schools expensive, if they are to be efficient; but they are worth the expense if it can be afforded. The advantages are numerous—the young minds are drawn out—their powers developed—their lungs exercised in cheerful noise, not in fretting and sullenness—not in crying all day and being beaten for it and into it by an ill-tempered mother or sister. They learn a great deal more, and retain it more lastingly than most people imagine they are capable of, in a way that keeps them amused, and their mothers or sisters are released from the care of them for so many hours of the day, and enabled to attend to the household and family concerns, which they could not if the young urchins were at home.

These advantages and many others quite independent of the moral and religious training which they get, should make it an object with any Government, to support liberally infant schools, as if they were the *foundation stone* of their whole educational system.

Moreover, the poorer the place, the more need is there for Government aid, which should not be withheld on the ground that no subscription can be raised in the locality. This being in my view, the very reason why Government should step in and do for the poor what they cannot do for themselves.

Indeed the same argument applies to all schools, and should cause a considerable modification in the rule which refuses aid in cases where the locality does not first contribute a certain amount. In many places the whole district is so poor, that the required amount can never be raised.

RICHARD H. WALL, D.D.,

Chaplain Royal Chapel of S. Matthew, Ringsend, and Patron of the Irishtown National Schools.

July 29th, 1868.

From the Rev. A. G. Ryder, D.D., Rector of Donnybrook.

St. Mary's, Donnybrook, September 1, 1868.

SIR,—I shall endeavour to reply to your queries *seriatim*.

1. There are two National schools and one Erasmus Smith "English" school in my parish, affording adequate means of instruction to the poor.

2. The Roman Catholic clergy naturally object to the attendance of children belonging to their Church at the Erasmus Smith school; hence those children are almost invariably withdrawn as soon as they can read. The "inability to forego children's wages" also operates adversely to a considerable extent, causing either total absence, or what is nearly as bad, very irregular attendance.

3. Fishing; bottle-works; iron-works; laundry.
4. See concluding remarks.
5. See answer to Circular "*A. C.*, 15."*
6. Not as far as my experience goes.
7. As a general rule schools aided by the State must excel in efficiency those depending on precarious or gratuitously administered funds.
8. In this parish the Erasmus Smith school and the Irishtown National school are attended almost exclusively by Protestants; the Ringsend, by Roman Catholics. Hence, I cannot answer this query from actual experience. But I am convinced that the "mixed education" system, if *faithfully and impartially administered by the State*, is calculated to produce beneficial results.
9. Gratuitous education, if not compulsory, appears to me objectionable. What is not paid for is seldom appreciated. Pupils who pay are much more regular attendants than free pupils.
10. A master for boys; a mistress for girls and very young boys.

On the general question of primary education, I am strongly inclined to think that it ought to be made, to a certain extent, compulsory. Many of the existing impediments might, I believe, be modified or wholly removed, if the system of "Morning school," was introduced, say from 6–9, A.M., in summer, and 7·30–9·30 in winter. The hours of subsequent instruction might be curtailed, and attendance during them left optional.

Girls ought to be trained systematically in household duties (including the economic cooking of food), and far more time assigned to sewing than is now done in our schools.

I incline to think that catechists should be appointed wherever practicable by the State, and charged with the duty of the religious instruction of the children of their own persuasion at stated hours. Such appointments being offered in the first instance to the clergy of the several districts, but if declined by them, being tenable by laymen or women.

The increased expenditure to which the above suggestions point might in time be wholly defrayed if the State would assume the control of the endowed schools, and apply their funds, in part at least, to the benefit of that class of the community whom they were originally intended to serve.

Your obedient servant,

ARTHUR G. RYDER, D.D., Rector of Donnybrook.

From the Rev. R. B. Stoney, Curate of Donnybrook.

1. Quite sufficient.
2. None of the reasons assigned in question 2 have much effect on the children's attendance, except the "inability to forego children's wages." Distance certainly has not, as many children both from Ringsend and Irishtown attend schools one mile and two miles distant, some because they have been in the habit of so doing for years—the school in Irishtown was shut for a time some years ago—or because they think the other schools are of a more advanced nature, and therefore suit them better. The reluctance in Irishtown and Ringsend of parents to send their children to school generally arises from either pure indolence, that will not take the trouble to have the children ready in time and to send them to school, or that the children in some cases are wanted at home for household work, and nothing surprises one more when walking through Ringsend than the number of children one sees playing about the streets during the hours of school. Of course this is partly accounted for, in Ringsend being a fishing village.
3. In the immediate neighbourhood of Irishtown there are two or three rope-walks, a foundry, a very large glass-making establishment, and one or two ship-building and boat-making establishments. These, and employment in the boats with their fathers or relations, generally take away the poorer children that do not become labourers or mechanics; clerkships, messengerships, and employment in shops, generally take away the better class of children at the age of fourteen or fifteen, and some become apprentices to the higher mechanical branches of trade.

The girls generally go out either as apprentices in shops or as dressmakers, or stay at home if there are but few children, assisting in the household work. The poorer girls go out as servants or stay at home till they are married.

Nothing strikes a visitant of the Ringsend and Irishtown schools more than the apparent youth of most of the children, particularly in the boys' schools. This is, I believe, the case with most town schools, and arises from the readiness of finding employment. The average age in the boys' school in Ringsend is about nine; I almost think a little under. Irishtown is about the same.

If there were more paid monitors to take their turn at *different* hours of the day, and so get some education themselves while being monitors, or if the education was of a higher nature than it is for the bigger boys, this would be much remedied I believe. At present when a boy has learned to read and write, and to work some sums, and knows a little geography and Euclid, he has not much more to learn, and therefore leaves the school on the first opportunity; whereas, did some of the boys stay on and get some good posts, some that would be considered prizes, the school would have a great impetus given to it.
4. I would give money rewards in the Irishtown school as is done in the Ringsend, and which is found to work very well, to those children who come in time, and who are well conducted.

I would give a special certificate at the end of the half year or year, and also when leaving school, to those children who had attended *really* regularly. There might also be one given for general good conduct.

I would allow children to come for half the day, the first or second half to be agreed on hereafter, and teach during that portion of the day reading, writing, and arithmetic, and only these. The other lessons and those to be learnt at home could be got over during the other half of the day.
5. Lord Pembroke would willingly assist, and does very largely assist, the Ringsend National school.

The best local aid is, I believe, to be found in a good attendance of respectable children.
7. The schools aided by the State are, as far as my experience goes, and I have been in a great number of schools, by far the best. This arises from (1) their having in general better buildings, a better supply of school materials, and better teachers, and (2) from the inspection being of such a superior order to any other I have ever seen.
8. Decidedly beneficial.

I would add as reasons:—

1. It teaches the children of the different denominations to live in peace and harmony, a thing which is necessary for them in afterlife, and it teaches them this from their very earliest years. Children sitting at the same form for years can hardly learn to hate one another in afterlife.
2. It teaches the Roman Catholic children that neither are the Protestants nor their clergy those irreligious, careless set that they are so often represented to be and *vice versa* the Protestant children.
3. As for an Established clergyman to have an objection to teach in a National school, it is simply preposterous; the children are there and he should be glad to teach them; besides, he does teach *under the very same conditions* when he undertakes the chaplaincy of a workhouse; and I never heard of a clergyman who had a conscientious objection, where well paid, to take the latter. He goes into the workhouse, promises to teach only the Protestant children, to speak to only the Protestants, and to do this at only the fixed or convenient time; and what else does the National Board require?
4. The National system of Ireland is *the system* that they are aiming at as perfection in England.
9. Perfectly gratuitous education is the worst thing possible; the children almost invariably come very irregularly. Something, however small, should always be charged, then the parents and children will value the education given.
11. There is an evening school in Ringsend which is, I understand, very successful.

ROBERT B. STONEY, Clk., Curate of Donnybrook.

5, Leahy's-terrace, Irishtown.

From the Rev. H. H. Dickinson, D.D., Vicar of St. Anne's Parish, Dublin.

1, Upper Merrion-street, Dublin,
August 11, 1868.

SIR,—I answer your inquiries on the subject of primary education as follows:—

1. The means of education in my own parish are—
   I. The parochial schools, boys', girls', infants' (day schools).
   II. The Kildare-place Model Schools, do.

These are sufficient for the parish.

2. There is no reluctance on the part of Protestants, but there are swarms of *Roman Catholic* children in the lanes and alleys of my parish who are left in ignorance, not from any "objection" on the part of parents, but from simple indifference; their priests do not look after the children, and do not appear to care whether they are educated or not, being only careful that they should *not* be sent to Protestant schools.
3. Industrial occupations have no effect; the only apparent occupation of the children who do not attend school, being street-idling.
4. In Ireland nothing will be effectual as regards Roman Catholic children, but the adoption of the compulsory system of education *for all* denominations, religion being, of course, *not compulsory*.
5. The local aid already given is liberal; I do not think that local aid would be given to Government schools in my neighbourhood, unless the *administration* of the system be better secured against alteration and tampering than the National Board, as at present constituted, *is*.
6. Government aid is, I believe, largely abused and misapplied in Dublin, and in Ireland generally. I have always been a strong and

* This refers to some information with regard to the amount of local support which is given to schools: the substance of Dr. Ryder's answer is given at page 62 of my report.

thorough advocate of the National Board *system*, but the abuses of it in the covert and indirect promotion of denominationalism in monks' and convent schools, have prevented me from ever identifying myself with a Board in which I have no confidence, whose functions ought to be merely executive, and are in fact mischievously legislative.

7. I have no doubt that schools aided by the State are superior in secular efficiency, *as a general rule;* but the constant superintendence of the clergymen will in particular cases (as I believe in my own and other parishes) secure a school's efficiency, and make it quite equal to that of a Government school.

8. I think mixed education is a good—the separation of children for religious teaching has been objected to as a continued and daily direction of the children's minds to the fact of their religious differences—but this seems a less evil than total separation; and companionship in secular education must have a tendency to promote kindliness and good will, and is, I think, so far beneficial.

9. Education ought not in my opinion be ever *gratuitous*, except in the case of infants. No fees are paid in my infant school. Boys and girls pay a penny per week.

10. Popular feeling is generally in favour of the head teacher being a master for boys; a mistress for girls.

11. I tried an evening school for about five years with fair success, and only closed it when pupils were drawn away to the evening school at Marlborough-street, which offered a wider curriculum.

12. "Ragged Schools," *as such*, I hardly approve of; I do not think raggedness should be a disqualification; but on the other hand, I do not think it ought to be in a sort advertised as a *qualification* for attendance. Better take them in, however ragged, and by penny clothing clubs, &c., teach them to be decent in dress, as in behaviour.

13. I think the number of teachers usually supplied to infant schools is inadequate.

I think that grammar as usually taught in our primary schools is the most profitless occupation of the pupils' time that could be devised, and I believe that instruction in common things should be much more aimed at than it is. The cultivation of music wherever practicable, I think of great importance, and for boys in rural districts, some knowledge of agricultural chemistry would be very useful.

I have always thought that the non-vested schools were a mistake, and I am convinced that if Government schools (so called instead of "National") had been established everywhere, on the principles of mixed secular, and non-compulsory religious education, the "conscientious objections" of priests and parsons would not have been brought forward, and being relieved from personal responsibility, and from scruples of conscience, clergymen of the Established Church, and perhaps Roman Catholic clergy too, would have generally adopted or fallen in with the Government system; just as they have done in the case of poorhouses and gaols.

I am, sir, your faithful servant,
HERCULES H. DICKINSON, D.D., Vicar of St. Anne's, Dublin.

Thomas King, esq., &c., &c.

From the Rev. R. Barton, Vicar of St. George's Parish, Dublin.

St. George's Parish.

SIR,—In reply to the list of questions contained in your printed circular of the 29th inst., I beg to state that there are in this parish four schools for the education of the children of the poorer classes, attended principally by the children of Protestants, namely, the parochial school in Portland-street, comprising a boys', a girls', and an infant school, under the superintendence of the clergy of the parish. The Summer-street schools, connected with the Free Church, under the superintendence of the Rev. John Hare. The Phibsborough schools, under the superintendence of the Rev. Francis Le Hunte. And the Retreat School, Drumcondra, under that of the Misses Smith. These schools, I believe, afford sufficient means of education for the children of the poor of this parish. The following answers have reference to the parish schools only.

1. I am not aware of any reluctance on the part of parents to avail themselves of the existing means of education.

2. There is an extensive brewery and a large baking establishment in this parish, but the employment of parents in these establishments does not appear to interfere with the attendance of the children in the parish schools.

3. Our present arrangements include examinations at certain periods in the year, when premiums are awarded to the children for regularity of attendance and superior answering in their classes.

A good meal once a day would be a great boon to many of the children, and would conduce to a more numerous and regular attendance. This we are unable to do from the means at our disposal, except in the case of the infant school.

4. The local aid for providing proper schools is given by those parishioners who subscribe to the school fund, which consists of dividends payable out of certain charitable bequests.

5. No Government aid.

6. I should suppose that schools aided by the State would be more efficient than those deriving no assistance from the Government.

7. Mixed education decidedly beneficial when it can be accomplished; but of late years the Roman Catholic clergy do not permit their children to avail themselves of the instruction given in our parochial schools.

8. Such of our children as can afford it pay one penny a week for their education. This money is added to the fund for providing premiums.

9. In the St. George's schools there is a master for the boys' school—and two mistresses, one for the girls' school, and one for the infant school. In this I believe we are in accordance with the popular feeling.

10. No evening schools.

11. No ragged schools.

12. A numerously attended infant school.

Your obedient servant,
RICHARD BARTON, Rector of St. George's.

July 31, 1868.

From the Rev. R. Vance, Vicar of St. Catherine's, Dublin.

Dublin, 24, Blackhall-street, 1st August, 1868.

SIR,—In reply to your printed circular of the 29th July, I beg to say that the means of education in my neighbourhood are superabundant, so much so that it is not at all uncommon for parents to remove their children from one school to another for the most trivial and sentimental reasons. In some of these schools the children pay a penny a week for instruction; in others, as in my own parochial schools, the instruction is gratuitous; in others again, not only is the instruction gratuitous, but the children who attend the school receive one meal a day; and, in addition to these three kinds, there is the ragged school. Again, as a general rule, each place of worship has a school in connexion with it.

One impediment to the instruction of the children pervades all these schools, viz., the removal of the children from school at the age of eleven or twelve years, with a view to the assistance which such children are able to give at home or the wages which they are then able to earn. Different plans have been tried to counteract or overcome this impediment, *e.g.*, night schools, which have not been successful in consequence of the children being too tired after a day's work to derive much benefit from the instruction at night. Then, the payment of monitors has been tried; but this method, operating at best only to a very limited extent, has not, from the small amount of money usually placed at the disposal of the master for such purpose, been found to be a sufficiently powerful corrective. An idea then occurred of giving orally a sort of homely practical instruction to the fathers and mothers themselves at what have been called "fathers' and mothers' meetings." This has been tried in St. Catherine's parish and with some success. But the success will greatly depend upon the superintendent of such meetings. However, I think there exists in society much latent energy that might be utilized for this purpose.

The plan adopted for securing regularity of attendance at St. Catherine's school is this. If a child has been present at or before ten o'clock on *each* day of the week a penny is set down to its credit at the end of the week, and the sum thence arising at the end of the year is added to the money value of the premium, which the child may have gained for distinguished answering, and then the resultant sum is given to the child either in clothes or books as the child or its parents may desire. In this way a sum of about £36 is annually given to the children of the school.

St. Catherine's schools are supported by private grants, generally of an old date, made by parishioners, the amount of these grants being supplemented by the proceeds of an annual sermon on behalf of the schools.

In the year 1854 a private Act of Parliament was obtained for the better protection and management of these school and other parochial funds. And although that Act of Parliament especially provided that the trustees thereby appointed of these funds should not interfere in ecclesiastical or educational matters, yet this proviso is found to be practically inoperative in consequence of the power left in such trustees to vary at their pleasure the salaries of ecclesiastical and educational officers. Hence, I would strongly recommend that in any legislation whereby the management of educational or ecclesiastical funds is intrusted to local boards, the meaning of the words "ecclesiastical and educational matters" and the meaning of "interference with such matters" should be precisely defined, if it be intended to confine such boards to financial matters, and to exclude them from interfering in matters of an ecclesiastical or educational nature.

I believe a united secular education, a separate religious education, and Government inspection, to be requisite and beneficial.

The master of my school answers Nos. 9, 10, and 13 of your printed circular thus—

"Gratuitous education is good in poor districts, but it always tells against the respectability of the school.

"The popular feeling is in favour of the head teacher being a master.

"Infant schools are very important in poor districts, where the mothers are generally employed at home or in some factory."

I have the honour to remain your faithful servant,
ROBERT VANCE, Vicar of St. Catherine's, Dublin.

From the Rev. T. S. Gray, D.D., Incumbent of Stillorgan.

Stillorgan Glebe, Blackrock, co. Dublin,
August 14th, 1868.

Dear Sir,—I herewith send my answers to some of the subjects mentioned in your printed form.

1. In *Stillorgan* the means of education are sufficient for the poorer classes; but a good school is much required at Newtown Park village in the same parish.
2. Inability to forego children's wages is the principal cause of irregular attendance.
3. Agriculture is the prevailing occupation, and at times it keeps many of the children from school.
4. I find attendance cards and annual rewards the best means of securing regular attendance.
5. The local aid that may be expected would not be more than *half* the sum necessary for the support of efficient schools.
6. No Government aid is received.
8. I have never found *mixed* education beneficial.
9. I think it a good plan to make those who can afford it pay, even though a small sum, for their children's education.
10. Mixed schools of boys and girls are not popular. Parents will not allow their daughters to attend them after eleven or twelve years of age. When two schools cannot be had then a master is preferable to a mistress.
11. An evening school is much needed, but we have no funds for the support of one.
12. Infant schools are most essential. We have one; another at Newtown Park would be most beneficial.

I consider the only plan of education likely to succeed in Ireland, and one that would, so far as my knowledge and experience goes, be acceptable to *all parties*, would be payment for results in secular education under Government inspection.

I remain yours faithfully,

Thomas Sill Gray, d.d., Incumbent of Stillorgan, co. Dublin.

Thomas King, esq., &c., &c.

From the Rev. J. F. Peacocke, Curate of Monkstown.

Monkstown, County Dublin,
9th September, 1868.

Sir,—In reply to your paper of questions regarding the state of primary education in this neighbourhood, I beg to offer the following remarks, premising that in what I say, I *refer exclusively to the Protestant portion of the population*, and the schools existing for their benefit.

1. The means of education I consider to be quite sufficient for the poorer classes. Protestant parents have every facility of procuring a good primary education for their children without any cost to themselves.
2. The parents, as a rule, show no reluctance to avail themselves of the existing means. The schools are sufficiently close to the homes of most of the children. There are no school-fees. The parents, as a whole, are sufficiently satisfied with the skill of all the teachers. No religious objections keep children of any Protestant denomination from the schools. Where there is reluctance on the part of the parents to send or keep their children at school it is caused by their finding them useful at home, or requiring what wages they can earn abroad to assist in the support of their families.
3. Fishing is the only industrial occupation that can be considered as affecting school attendance; this it does, to some extent, amongst the boys, who often, at an early age, at least for certain periods of the year, leave school for sea; employment as messengers, &c., by the gentry and shopkeepers also takes away many boys before they are sufficiently educated. These causes do not operate in the case of the girls.
4. The only plan adopted for securing more regular attendance is that of giving tickets at the end of each month to every boy whose attendance, conduct, &c., have been satisfactory, and at the end of the year those pupils who have obtained a certain number of tickets are given rewards. I consider that the attendance could hardly be *increased* to any appreciable extent, but it might be much more regular than it is.
5. Any amount of local aid that could reasonably be required for supporting efficient schools, is easily procured, the parish being wealthy.
6. Our schools receive no Government nor other public aid.
7. There being no schools in the neighbourhood receiving State aid, so far as I know, I am unable to make any comparison such as that suggested in this question.
8. I have no practical experience of the advantages or disadvantages of "mixed education" all the pupils attending our schools being, with one or two exceptions, members of the Established Church, but my opinion is, that as a system it is likely to work well only when the instruction given is confined to secular subjects during the whole of school hours. The system of separating the pupils of different religions for the purpose of religious instruction at a certain hour each day, as it seems to me, tends to neutralize in a great measure the benefit intended to be produced by united education, by keeping constantly before the minds of the children their religious differences.
9. The education given in our schools is entirely gratuitous. I am strongly of opinion that this is a mistake; where children can pay even a trifle for their education, they should be required to do it. I see the evil effects of giving education gratuitously in our male and female schools. The parents do not value it as they ought, nor are they so careful in sending their children regularly to school, as they would be if they had to pay fees however small.
10. I should say the popular feeling is decidedly in favour of having a mistress at the head of the girls' school, and a master at the head of the boys'. This has always been the rule in our schools, and I have never known anyone desire that it should be otherwise.
11. For many years there was a night school maintained in this parish at considerable expense. It did not prove as useful as it was expected it would have proved, though it afforded to young men who had left the daily school for situations, the opportunity of improving themselves with a view to their advancement. It was for several years maintained entirely out of the school funds, when it became necessary to retrench in expenditure. The pupils of this school were required to pay a small sum quarterly, and provide their own stationery. This they failed to do, consequently, after a time, the school was finally closed. I consider night or evening schools are calculated to be most useful to young men employed during the day, but they ought to be nearly, if not entirely, self-supporting.
12. I have nothing to remark on ragged schools, having no practical acquaintance with the working of them.
13. Infant schools are most useful institutions, and I have always found them to be thoroughly appreciated by the parents, as they relieve them of the care of their younger children for several hours each day. I have often been surprised at the amount of instruction that can be given to even very young children by an efficient teacher. Our infant school is the most entirely satisfactory and flourishing of our schools. There are 106 children on the roll, and yesterday there was an attendance of ninety.

I have the honour to be your most obedient servant,

J. F. Peacocke, m.a., Curate of Monkstown.

Thomas King, esq.

From G. Wolfe, esq. D.L., J.P. for the Counties of Kildare and Wicklow.

Replies to Queries.

1. In this immediate neighbourhood the means of education are sufficient.
2. Generally speaking, the parents are willing to send their children to school.
3. Mostly farming occupation and factory employment on a small scale. At the hay season, say two months in summer, the attendance at school is not so good as at other times.
4. I do not know of any.
5. None required at present.
6. None given except by National Board, which is fairly taken advantage of.
7. No comparison in this locality.
8. There are so few Church of England school children I cannot tell.
9. There is none in this parish.
10. The popular feeling is to have both male and female teachers.
11. In winter there is an evening school—it works well; in summer there is none.
12. There is no ragged school.
13. There is an infant school; it works extremely well, and is much valued by all classes.

Signed, George Wolfe, j.p. for Kildare and Wicklow.

APPENDIX II.

The following tables exhibit in a condensed form some of the results of my examination of schools situated in the district of Dublin.

The first table relates to National schools, the second to parochial and other schools of that class.

The first column of the first table shows the tenure of the school buildings, whether vested in the Commissioners of National Education (v.c.), or in trustees (v.t.), or the property of the manager (not vested).

The second column gives the number of scholars on the school-rolls, and their religion, on the day of my visit. This number, it will be observed, is always greatly in excess of the number present, and for this reason: it is the duty of the teacher to enter on the school-rolls the name, age, and religion of each child on the day of its first attendance, and to retain the name on the list until it has been observed that three months in succession have elapsed, during which the child has never attended the school. It is not difficult to imagine that the teachers would, probably from simple inadvertence, retain many names for a much longer period than that which is prescribed; and even if they did strike off each name rigorously as soon as they were justified in doing so, yet the excess of the number on the roll above the average attendance would be considerable, in consequence of the habit of attending school casually which has been acquired by so many of the scholars.

The fourth, fifth, and sixth columns relate to the teaching staff, and require no remark, except to explain the symbols by which the grade of the principal teacher is denoted. These are the same as those used in the rules and regulations of the Commissioners. The letter T indicates that the teacher has been trained at the model school, and the date is that of his appointment to his present post.

Of the columns which follow four are taken from the appendix to the report of the Commissioners; the fifth I calculated from the results contained in the four preceding. I call it an estimate of the expense per head of conducting the school, on the supposition that this is due to the salaries of teachers and monitors. No account of other expenses, such as the repairs of buildings, &c., appears to be generally kept.

The second table, which relates to the parochial schools, could not be drawn up in exactly the same form as the former. The information it gives is of a similar kind, and will afford some data for a comparison of the relative expense of the two systems, National and private. I could not, however, obtain in all cases copies of the accounts which I desired, and thus the table is imperfect. In making a comparison, also, it should be noticed that the expense per head, on account of teachers' salaries in the parochial school, is calculated without regard to the residence which is so frequently provided. The emoluments of the parochial teachers are, therefore, larger than the mere salary, and, consequently, the apparent expense incurred in conducting these schools is comparatively less than the expense incurred for the same object in the National schools. In some of the schools I have discovered, either from the report of the Church Education Society or from accounts supplied to me by the manager, the whole amount collected for their support in the year 1866. These sums are entered in the tables.

Table I.—National Schools.

APPENDIX III.

This appendix contains some original documents relating to schools which I visited, and which I have thought so important as to justify their introduction here.

The first is the report of the Inspector of the Church Education Society on the school at Glasthule, mentioned at page 66 of my report. It needs no explanation.

Two letters I received from J. E. Vernon, esq., agent to the Earl of Pembroke, relating to the schools on the Pembroke estate, and some statements of accounts of the Ringsend school follow; a reference was made to these at page 60 of my report.

Mr. Stokes sent me an extract which he had made from the evidence given before the Commissioners of Education in Ireland in 1824, describing a curious state of affairs in connexion with a school which we visited; and I received from the office of the Commission copies of documents relating to the school at Shillelagh, which Mr. Stokes and Mr. Dunne visited towards the end of last year. All these are reproduced here.

REPORT OF THE INSPECTOR OF THE CHURCH EDUCATION SOCIETY ON GLASTHULE SCHOOL.

CHURCH EDUCATION SOCIETY FOR IRELAND.

30th day of June, 1868.

REPORT of the YEARLY INSPECTION of GLASTHULE MALE SCHOOL. Rev. A. Windle, Superintendent; Michael Shea, Teacher.

Gross number on Roll, 78. Sex—Males, 78. Religious Profession—Church, 72; Dissenters, 6. Average attendance, 45. Present at Inspection, 53. One or two came in after numbers counted.

EXAMINATION IN PROFICIENCY.

On Roll—1st Class, 24;	2nd Class, 29;	3rd Class, 11;	4th Class, 8;	5th Class, 5;	6th Class, 1.	Total,	78
Absent—1st Class, 10;	2nd Class, 9;	3rd Class, 3;	5th Class, 2;	6th Class, 1.		,,	25
Present—1st Class, 14;	2nd Class, 20;	3rd Class, 8;	4th Class, 8;	5th Class, 3.		,,	53
Promoted—1st Class, 4;	2nd Class, 18;	3rd Class, 7;	4th Class, 7.			,,	36

QUERIES.	ANSWERS.
1. Is it the practice to open the school with prayer? . . .	Yes; and singing.
2. Are the rolls, register, &c., properly kept, and the mechanical system of the Society observed?	Yes.
3. Are the pupils orderly and clean? Does the teacher seem to possess due control in the school?	Yes.
4. Is the school sufficiently supplied with books and requisites? If you found any books not sanctioned by the Society, name them.	Yes; fairly so.
5. Has there been any change of teacher since last Inspection? If so, state when he or she took charge; if married; if trained, and when, and where; amount of fixed salary.	Michael Shea (married; trained by Irish Church Missions); was appointed January, 1867. Salary, £65.
6. Other emoluments of teacher? Value of residence (if any)? Do. land? Do. fuel?	Master lives in own house.
7. Do the parents contribute anything towards the teacher's support? If so, state the amount.	Pupils generally pay—some 3*d.*, some 1*d.*, according to class. Capitation fees to teacher last year, £9 19*s.*
8. Are the Scripture Lessons repeated and read with accuracy, *reverence*, and intelligence?	Yes.
9. What is the regulation as to imparting Church instruction? .	Catechism taught to children of Church.
10. Is the school-house in good repair, sufficiently ventilated, and furnished; and by what means kept in repair?	All very good.
11. Was the superintendent, or were any of the local gentry present at the inspection? If so, name them.	Rev. A. Windle, Mrs. Swan, Miss Magrath, Mrs. Vesey, Miss Jones, and several others; also Thomas King, esq., Assistant Commissioner.
12. Let the master (or mistress) teach a class in your presence, and state his or her proficiency as to manner of imparting instruction.	
13. Give your opinion of the answering and progress of the higher classes in the following subjects:—	

1. Scripture—Very good. 2. Catechism and Formularies of the Church—Very good; improved. 3. Arithmetic—Very good. 4. Spelling—Very good. 5. English Grammar—Very good. 6. Geography—Very good. 7. English History—Very good. 8. Composition—Very good; improved. 9. Handwriting—Very good. Euclid—Three or 4 boys learning.

Also the progress of the lower classes in reading, &c., . . .	I found the lower classes above the scale, so I made a large move.
Portions of Scripture repeated by higher classes, ...	Acts 7.
Do. learned for examination, ...	Twenty-four chapters of 1 Sam.; 18 chapters of Acts.
Portions repeated by lower classes, ...	St. John, 10.

GENERAL OBSERVATIONS.

Since Mr. Shea's appointment the school has steadily improved in answering, and increased in attendance. I had very good answering in the usual subjects; catechism and composition much improved, and spelling and arithmetic above common schools.

HUGH HAMILTON, Inspector.

CHURCH EDUCATION SOCIETY FOR IRELAND.

30th day of June, 1868.

REPORT of the YEARLY INSPECTION of GLASTHULE FEMALE SCHOOL. Hannah Henessy, Teacher.

Gross number on Roll, 53. Sex—Males, 4; Females, 49. Religious Profession—Church, 49; Dissenters, 4. Average attendance, 36. Present at Inspection, 37.

EXAMINATION IN PROFICIENCY.

On Roll—1st Class, 19;	2nd Class, 17;	3rd Class, 12:	4th Class, 3;	5th Class, 2.		Total,	53
Absent—1st Class, 5;	2nd Class, 4;	3rd Class, 5;	4th Class, 1;	5th Class, 1.		,,	16
Present—1st Class, 14;	2nd Class, 13;	3rd Class, 7;	4th Class, 2;	5th Class, 1.		,,	37
Promoted—1st Class, 4;	2nd Class, 10;	3rd Class, 1.				,,	15

QUERIES.	ANSWERS.
1. Is it the practice to open the school with prayer? . . .	Yes; and singing.
2. Are the rolls, register, &c., properly kept, and the mechanical system of the Society observed?	Yes.
3. Are the pupils orderly and clean? Does the teacher seem to possess due control in the school?	Yes.
4. Is the school sufficiently supplied with books and requisites? If you found any books not sanctioned by the Society, name them.	A fair supply.

Queries.	Answers.
5. Has there been any change of teacher since last Inspection? If so, state when he or she took charge; if married; if trained, and when, and where; amount of fixed salary.	Hannah Henessy (unmarried; trained at Kildare-place); was appointed 1864. Salary £23.
6. Other emoluments of teacher? Value of residence (if any)? Do. land? Do. fuel?	£15 allowed for a house. The mistress pays £30 for her house.
7. Do the parents contribute anything towards the teacher's support? If so state the amount.	Mistress got £5 8s. capitation fees. Children, except a few, pay 1d. per week.
8. Are the Scripture Lessons repeated and read with accuracy, *reverence*, and intelligence?	Yes.
9. What is the regulation as to imparting Church instruction?	Catechism taught to children of Church.
10. Is the school-house in good repair, sufficiently ventilated, and furnished; and by what means kept in repair?	All very good; has been improved lately.
11. Was the superintendent, or were any of the local gentry present at the inspection? If so, name them.	Rev. A. Windle, Miss Jones, Miss Magrath, Thomas King, esq., Assistant Commissioner, and several others.
12. Let the master (or mistress) teach a class in your presence, and state his or her proficiency as to manner of imparting instruction.	
13. Give your opinion of the answering and progress of the higher classes in the following subjects:—	

1. Scripture—Very good. 2. Catechism and Formularies of the Church—Very good; improved. 3. Arithmetic—Fair; not as good as the boys. 4. Spelling—Very good. 5. English Grammar—Very good. 6. Geography—Very good. 7. English History—Very good. 8. Composition—Very good. 9. Handwriting—Very good.

Also the progress of the lower classes in reading, &c.,	Except the infants in 1st class nearly all have learned to read.
Portions of Scripture repeated by higher classes,	Heb. 11.
Do. learned for examination,	1 Sam. to ch. 25; first 18 chaps. of Acts.
Portions repeated by lower classes,	Ps. 19–121, 23.

General Observations.

Some of the best pupils have left school, and their place is not yet supplied. I had very good answering in most of the subjects, but the girls did not answer quite as well as the boys. This is merely casual. The spelling and exercise were very good; Miss Henessy has taken some hints which I gave last time.

Hugh Hamilton, Inspector.

Ringsend and Irishtown.

The following letters were written by Mr. Vernon in reply to a request from me for information on the points mentioned in them. When I visited the district for the purpose of inquiring into the condition of the schools Mr. Vernon was absent, and I had therefore no opportunity of obtaining the information which I have now in a definite form. The letters should be read with reference to the passage in my report at page 60, referring to the Ringsend and Irishtown schools.

Ringsend National School.

Wilton-place, Dublin,
April 17, 1869.

Dear Sir,—The statement contained in yours of the 13th inst. in reference to the above school does not appear to be quite correct.

The school originally, as you state, consisted of two departments—male and female. To these has been added a department for infants.

The school has always been visited by the Protestant rector of the parish or by one of his curates, as well as by the Roman Catholic clergyman or by one of his curates; but I have never heard that either of them exercised or claimed any voice in the patronage which was vested in Mr. Sidney Herbert (afterwards Lord Herbert) and has been for the last fifteen years exercised by me as patron of the school, without any reference to the clergy, and exclusively upon the recommendation of the Commissioners of Education.

Whether any such arrangement as you refer to may have originally existed I know not, but if so I have never heard of it. I have always maintained, with respect to the religion of the teachers appointed by me, the numerical proportion which I found when appointed agent to Mr. Herbert in 1853.

The school is vested. The buildings were, as I understand, erected at the sole cost of the late Lord Herbert. The enclosed memorandum will show precisely in what proportion the guardians of Lord Pembroke contribute to this school.

Irishtown School.

This school is non-vested and under a committee of management.

It is quite true that some time ago I was desirous that it should be vested and that some further control should be obtained over it by the Commissioners. The objection put forward was that the buildings were private property.

To this school Lord Pembroke's guardians contribute now £17 per annum, but have no voice in the management of the school nor in the appointments connected therewith.

Should there be any point upon which I can give you further information I shall be glad to do so.

Believe me faithfully yours,

John E. Vernon.

Thomas King, esq.,
Jesus' College, Cambridge.

RINGSEND NATIONAL SCHOOLS.

Wilton-place, Dublin,
April 28, 1869.

DEAR SIR,—I find that the above school is visited occasionally by the curate of the Established Church, and constantly by the Roman Catholic curate.

The Sisters of Mercy from one of the convents of the district visit and teach twice a week.

It is quite true that the parents of the most clever of the Roman Catholic children are advised to send their children to the Christian Brothers' school, but I am not aware of the Protestant rector having refused to allow a sermon to be preached in aid of the Irishtown school.

Since the opening of the latter school there has been a steady decrease in the number of Protestant children sent to Ringsend, as will appear by the return which I send you herewith.

If I am correct in the fact that all the teachers in the Irishtown school are Protestants it is not difficult to see the reason of the preference.

Believe me very faithfully yours,
JOHN E. VERNON.

Thomas King, esq.,
Jesus' College, Cambridge.

"Were there at any time more Protestant pupils at the school than now? If so, when?"

Ringsend School, 26 April, 1869.

SIR,—As I took in the words to-day the above is the question to which I requested Mrs. Richmond and Miss Waters, on my return from the office, to give me their replies for your information to-morrow.

The replies I received are:

In the male school.—The largest number of Protestant pupils was on the rolls in December, 1860. The number then was twenty-eight; it is now two.

In the female school.—In January, 1865, there were twenty-two Protestants; in April, 1867, seventeen; in April, 1868, eighteen; in April, 1869, twelve, and ninety-nine Roman Catholics.

So that in the female school the largest number of Protestants was in 1865.

In the infant school.—In the April of—

	1859.	1863.	1866.	1869.
There were Protestants,	42	30	27	21
„ Roman Catholics,	92	90	91	115

So that in the infant school the largest number of Protestant children was in 1859.

I am, Sir, your most obedient servant,
JOHN HARTE.

John E. Vernon, esq., D.L.
1, Wilton-place.

The following returns relate to the evening school and are mentioned at page 61 of my report.

Ringsend National Evening School.

TEACHER'S REPORT for month ending the last Saturday of September, 1868. To be submitted each month to W. Arthur, esq., Ringsend Glass Bottle Works, Treasurer to the Evening School Fund.

Amount £2 10s. 0d.

Received from W. Arthur, esq., Ringsend,
JOHN HARTE, Teacher.

The summer vacation was given in June, July, and August as usual.

Forty-two admitted free out of the 107 remaining on the rolls; 5s. 11d. school fees received during the last four weeks.

Date, 26th September, 1868.

ENNISKERRY SCHOOLS.

An Extract from the Appendix to First Report from Commissioners on Education in Ireland.

Examination of Rev. Robert Daly, 15th December, 1824.

Has there lately been a school established at Enniskerry for the education of infants?—Yes.

Will you be so good as to describe the nature of that establishment?—I think there are forty-four or forty-six children at the school at Enniskerry; Enniskerry itself has not a sufficient number of small children to justify an infant school, so that there is a caravan that goes up into the mountains, and brings down twenty or thirty, and carries them back again; there is a young woman who was trained under a Mr. Wilderspin in England, who has the care of them. She seems to have a very tender feeling for the children, they are very much pleased with the work they go through, and their learning; it is a very pretty sight to see them; Lady Powerscourt gives them one meal in the middle of the day, on account of their having to come so far, and they seem as happy as they can be.

At what age are they received?—From two years old to six; they are superannuated at six.

In what is it possible to instruct them?—They learn their alphabet, and they learn to obey, and they sing a hymn, it is wonderful how well they sing; in short they are trained to obedience until they are six years old, and then they are drafted into the other schools.

Are the parents fond of sending them there?—Yes, they are; but the Roman Catholics will not send them—the priest has objected to the infant school most strongly; I do not believe there is one Roman Catholic child in it.

Does he object to it more strongly than the other schools?—Yes; I think there was more said against it.

Do you know on what ground it was objected to?—I can only speak from hearsay; that the Rev. Mr. Daly said, it was the greatest attempt that was ever made to make heretics of them from their very youth; but I know the people say that they are not allowed to send them; they would be very glad to send them if they were; the consequence is, that I do not believe there is a single Roman Catholic child in the school.

What hours do they attend?—From nine to three.

Does the caravan take them home again?—Yes; it brings them down and takes them up again, it goes about two miles up the mountains; I met it the other day with twenty-two infants in it, and they seemed quite happy.

School maintained by Earl Fitzwilliam at Shillelagh.

The following correspondence relates to the school at Shillelagh maintained by Earl Fitzwilliam which is mentioned at page 38 of my report.

Office of Primary Education Commission, 46, Sackville-street, Upper,
Dublin, 6th January, 1869.

Sir,—Upon the occasion of the visit last November of some members of this Royal Commission you gave some information concerning Lord Fitzwilliam's school at Shillelagh, which it is advisable to have in a more authentic form.

Hence, we have to request that you will let us know as soon as possible—

1. The number of children borne on the rolls of the school.
2. Average attendance.
3. Number in each class—specifying the book read in the class, and the portion of arithmetic which is taught in the class.
4. Number of each class present on 19th November, 1868.
5. Number of each religious denomination on the rolls.
6. Number of each religious denomination on 19th November.
7. What arrangements are made for the religious instruction of the children.
8. Names, religious denomination, date of appointment, place of training and classification (if any) of the several teachers engaged in the school.
9. Salary, emoluments, and allowances of all kinds of each teacher, stating where residence is provided, and the extent of such accommodation.
10. Date of establishment of the school.

We remain, sir, yours faithfully,
George A. C. May.
D. B. Dunne.

To Mr. John Rebanks, Master of Lord Fitzwilliam's school, Shillelagh.

1. 106.
2. Yearly, 65, or for the months of September, 73, and October, 71.
3. First or senior class, 15; second class, 52; third class, 39—first class, the Fourth Irish book—the second class is subdivided into three parts, and reading Second Irish Book, Sequel and Third Book. Third class, First Book on boards. Arithmetic is taught with a different classification, according as the pupils advance and *not* according to reading classes; hence, we have children in nearly all rules.
4. First or senior class, 7; second class, 22; third class, 17. *N.B.*—Numbers low on that date owing to the prevalence of scarlet-fever, and in consequence of which the school was closed on November 25th, and not yet opened.
5. Protestants, 6; Roman Catholics, 100.
6. do. 3; do. 43.
7. Separate rooms—conducted from 10 to 11, A.M. Male and female for Roman Catholic children. Myself for Protestants; the Roman Catholics under the immediate superintendence of the parish priest and curate.

Name.	Religious Denomination.	Date of Appointment.	Place of Training.	Classification.
John Rebanks,	Church of England,	February 1, 1864,	Glasgow F. C. Train. Col.	Second year's.
Margaret Rebanks,	Free Church, Scotland,	Do.	Do. do.	—
James Doyle,	Roman Catholic,	May 1, 1845,	Diocesan School, Wexford,	None.
Sarah Deegan,	Do.	November, 1865,	None,	None.

9. As all salaries, emoluments, allowances, &c., are paid by Earl and Countess Fitzwilliam, and as each teacher make their own *private* engagements I do not feel at liberty to answer question 9.

N.B.—I answered question 9 to D. B. Dunne, esq., as regards myself on November 19th, but only with the understanding that it was to be used as private information.

10. March, 1822.

Offices of Primary Education Commission, 46 Sackville-street, Upper,
Dublin, 8th January, 1869.

Sir,—On the 6th instant we addressed a letter to Mr. John Rebanks, the master of the Shillelagh School, requesting information concerning the school under certain heads. Among them was the following:—

"9. Salary, emoluments, and allowances of all kinds of each teacher, stating where residence is provided and the extent of such accommodation."

In reply Mr. Rebanks says—

"As all salaries, emoluments, allowances, &c., are paid by Earl and Countess Fitzwilliam, and as each teacher make their own *private* engagements, I do not feel at liberty to answer question 9."

As it is important that the Royal Commissioners should be accurately informed upon all such matters, we have to request that you will be good enough to authorize Mr. Rebanks to furnish the desired information.

We remain, sir, your obedient servants,
George A. C. May.
D. B. Dunne.

The Honorable F. Ponsonby.

To the Commissioners on Primary Education.

Shillelagh School, January 14th, 1869.

Gentlemen,—In compliance to the wish of the Honorable F. Ponsonby—see back of this letter—I herewith enclose you a full answer to question 9.

I am, gentlemen, your obedient servant,
John Rebanks.

	£
To joint salary of self and wife,	80
„ allowance to self for superintending night school,	5
„ for fuel to master's house, soap, brushes, flannel, &c., to heat and keep whole place clean,	12
„ of two servant girls to keep all clean.	
„ of fuel to school-rooms, day and night,	7
„ of grass of cows.	
„ of free house, very commodious, exceedingly well furnished, having every convenience behind as wash-house, mangle-house, &c., together with *two* good gardens, one in front and the other behind the house. Residence situated contiguous to school-house.	
To salary of James Doyle, Roman Catholic assistant,	30
And free unfurnished residence and good garden.	
„ allowance for teaching night school,	5
„ for fuel for house,	5
To salary of Sarah Deegan, Roman Catholic female assistant,	4
And no emoluments or allowances.	

I may here mention that all wear and tear of my furnished residence, the assistant's unfurnished residence, together with the school-house, is made good by Earl Fitzwilliam.

Endorsed on back of letter.

Please to send the statement as required by the Commissioners.

Fred. Ponsonby.

PALL MALL

ANALYSIS OF MR. COWARD'S REPORT.

	Paragraph.
General view of District, and plan of operations,	3–4
Ready access to schools, and information given,	5–6
Exception—reluctance to express sentiments in writing,	7–8
Method of visiting schools, and of gaining information,	9–12
Education valued in Ireland—Proof,	13
Increase of National System evidence of earnestness,	15
Motives stimulating education,	16
Mixture of different classes of society in schools,	19–20
Middle-class education supplied in National Schools, in Christian Brothers', and in other schools of religious communities,	21–4
The farming class educated in Primary schools,	25
Children of the poor principal constituents of Primary schools,	26
Occupation of this class in towns and in the country,	27–8
Tables of occupation of parents,	28

DIFFERENT CLASSES OF SCHOOLS VISITED.

Summary of schools visited, and summary of attendance,	32–3
Means of education,	34–7
Proportion taught by "Religious Orders,"	38–9
Religious orders generally popular,	40–2
Number of Conventual schools unaided,	43–8
Efficiency of aided and unaided religious schools,	49–51
National Convent Schools not efficient,	52–3
Remedy, examination of Nuns, discussed,	54–6
Practice of changing teachers should be abolished,	57
Kinsale Convent National School; described,	59–63
Convent Schools large,	64
Schools conducted by Religious men,	65–72
Established Church National schools,	73–7
Presbyterian schools connected with National Board,	78–83
Comparative expensiveness of National Schools,	84
Church Education Society,	85–90
Workhouse schools,	91–3
Irish Society,	94
The Islands and Coast Society,	95
Hedge Schools,	96
Infant Schools,	97–106
Evening Schools,	107–9

MIXED SCHOOLS.

Mixed Schools,	110

ATTENDANCE.

Number at school in proportion to population,	115–122
Proportion of religious denominations at school,	123–4
School accommodation,	128–135
Number of scholars on the rolls of schools visited,	136
Statistics of National schools not quite trustworthy,	138
Classification,	140
Proportions in each class for all descriptions of schools,	140–1
Per-centage of each class in do.,	142–5
Ages,	146
Average daily attendance,	147–155
Average number of days spent in school yearly,	156
Causes of irregular attendance,	157–8
Irregular attendance may be remedied,	159
Age on coming to and leaving school,	162–3
Time occupied in passing through each book,	164–6
Remarks on scholars above fourteen years old,	167
Registers,	168–72

MIXED EDUCATION.

Education practically denominational, reasons,	173
National system has failed to unite persons of different religious denominations,	175–6
No mixture of religion in Catholic National schools,	177–80
National schools of Established Church,	181
Church Education Society's schools,	183
Majority desire denominational system,	184–7
Presbyterians oppose denominational system,	188–9
Benefits of denominational system,	190
Nothing in circumstances of country against it,	191
Present system meaningless,	192
Its effects bad,	193
Denominational system concerns welfare of State,	194
Good training system needed; only possible on denominational system,	195–6
Catholics and Protestants not treated equally now,	197–8
Christian Brothers increasing,	199
Their influence great,	200
Religious feeling and sense of right in favour of denominational system,	201
Circumstances justify claim,	201
Opinions of Established clergy and laity,	204–6
Presbyterian clergy strongly opposed to denominational plan,	207
Opinions of some of Established clergy opposed to denominational system,	208

TEACHERS.

Proportion of children to teachers in different classes of schools,	210–16
Grades of National teachers,	217–19
The low grade of teachers remarkable. Causes,	220–5
Relative efficiency of different grades fairly equal,	226–7
First class teachers,	228
Feelings of teachers on method of advancement,	229–30
Advancement should go with good service,	231
Principal teachers generally experienced,	232
Church Education Society's teachers classed,	233
Training. Trained principal teachers exceed untrained,	234
Assistant teachers, all untrained,	235–7
Training desired by teachers and managers,	238–9
Advantages and imperfections of present training system,	239–41
Class from which National teachers come,	242
Salaries; their sources; average amounts, &c.,	243–7
Deductions from salary,	247
No residences, as a rule. Average cost of rent,	248–9
Expenses which fall upon teachers,	250–2
Sale of books; teachers not benefited by it,	253
Assistants' salaries,	254
Extraneous employment of teachers,	255–7
Salaries thought insufficient by teachers,	257
Teachers' position and influence lowered,	258–9
Uncertainty of tenure of office a grievance,	260
Proposed remedies discussed,	261–2
Absence of pensions a great grievance,	263–4
Supply of efficient teachers,	265–6
Public estimate of teachers low,	267–8
Managers anticipate diminution of supply,	269
Necessity of a change,	270
New training schools, and better pay, &c., necessary,	271
Local aid should supplement increased expenditure,	272
Payment by results, &c.,	273–4
Teachers of Church Education Society,	275–6

INSTRUCTION.

Summary of schools,	277–9
General remarks on reading,	280–2
Reading in Convent and Christian Brothers' schools better than in National schools,	283
Writing in National schools,	284–5
Writing imperfect in Christian Brothers', &c., schools,	286–8
Arithmetic generally deficient,	289–90
More satisfactory in higher classes,	291–3

ANALYSIS OF EXAMINATION OF CERTAIN CONVENTUAL AND OTHER SCHOOLS.

Paragraph.

Examination of higher classes of five schools, . . 305–6
Notes of Examination of twenty-one schools, . 308–38
Grammar and geography taught in all schools, 339–40
Industrial occupations, ... 341
Intelligence of children, ... 342–4
Discipline deficient in National schools, . . . 345–9
Christian Brothers' schools patterns of order, . . 350
Discipline in Church Education Society's schools, . 351
Religious instruction, ... 353–4
Subjects, and time devoted to religious instruction, 355–6
General remarks on instruction, ... 358–63
Table A.—Showing in each class the average age of children, the number present, and per-centage which passed the examination held at various schools in the Cork district, so far as visited, . 364
Table B.—Summary of Table A, showing, in each class, the average age of children, the number present, and per-centage which passed the examination held at various schools in the Cork district, so far as visited, ... 364

SCHOOL FINANCE.

Finances of National schools simple, . . . 365
No subscriptions, ... 366
Landlords do nothing. Causes, ... 367
Activity of Protestants contrasted with apathy of Roman Catholics, ... 368–71
State looked to for everything as regards education, 371
Government grants, ... 372
Cost of education in different schools, . . 373–80
Aid demanded (by all classes) unconditionally, 381–82
School-fees, ... 383–7
General average payment unreasonably low, . 388–90
Indifference of managers injurious to people and teachers, ... 391–94
Reasons of unwillingness to pay fees, . . . 395
Gratuitous instruction generally prevalent, . 396–99
Effects of this vast system of gratuitous instruction, 400

SCHOOL BUILDINGS.

Classes of National school buildings, ... 401
Comparison of condition of schools vested in the Commissioners, and schools vested in Trustees, . 402–3
Two vested and non-vested schools compared, . . 404
Schools vested in the Commissioners not increasing, 406
Repairs imperfect of schools vested in Trustees, . 407
Condition of non-vested schools, ... 408–18

Paragraph.

Offices common but bad, ... 419
Condition of school-buildings not connected with the Board, ... 420–1
Condition of furniture, fittings, apparatus, &c., &c., 422–23

MONITORS.

Different classes of monitors, ... 424
Numbers; supply; method of appointment, . . 425
Their utility and general efficiency, ... 426–7
Monitorial system might be made more efficient, . 428
Monitors in Christian Brothers' schools, . . . 429

SCHOOL MANAGEMENT.

Schools entirely managed by the clergy. Causes, . 430–1
Duties of school managers very imperfectly discharged, ... 432
Education would benefit if managers took more interest in schools, ... 432
Lay influence desirable, but not practicable, . . 433

INSPECTION.

Results of inspection of National schools moderate, 434
Individual examination needed, ... 435
Moral value of inspection, ... 436

BOOKS.

Books of National Board generally used and approved, except as regards their un-Irish character, 437
On the whole they are good, but supply deficient, . 437
Books of Christian Brothers, ... 437

REGULATIONS OF THE BOARD.

Regulations of National Board observed, . 439–40
Some change of system necessary, ... 441

Page.

APPENDIX A.—Table showing different degrees of salaries of the teachers in—

(1) Ordinary National schools, . . . 158
(2) Church Education Society's schools, . 158

APPENDIX B.—Circular addressed to clergy and others, ... 159

Replies from ministers of different religious denominations—

(1) Established Church, ... 159–60
(2) Roman Catholic, ... 160–3
(3) Presbyterian, ... 163–4

Laymen, ... 164–5
National teachers, ... 165–9

Report of W. Scott Coward, esq., Assistant Commissioner.

My Lords and Gentlemen,

1. On 24th June, 1868, I was directed by the Secretaries of the Royal Commission on Primary Education in Ireland to commence my inquiries as an Assistant Commissioner in the district of Cork which was assigned to me as the sphere of my labours—the Constabulary districts of Cork city, Bandon, Kinsale, Skibbereen, Mallow, Fermoy, Mitchelstown, Middleton, and Youghal constituting it; and although Queenstown and Passage West were not included in the Constabulary lists which I received, I considered them places of sufficient importance to visit and report on, and included them, therefore, in my investigations.

2. I was unable, owing to my official engagements as Acting Inspector of schools in England, which extended over the whole of the month of June, to commence my labours on the day named by the Commission, and was obliged to defer my journey to Ireland until 30th of that month, on which day I arrived in Dublin, where a delay of a few days was incurred for the purpose of getting certain forms prepared and printed. I arrived in Cork on Friday, 4th July, and remained in my district until September 21st, when it was time to return to my post in England.

General view of district.

3. The district assigned to me was large, the distance between its extreme points, Youghal and Skibbereen, being about seventy-six miles, and its extreme breadth not much less than forty miles. It contained the city of Cork, containing about 80,000 inhabitants, and nine other smaller but important towns, with an united population of about 32,615, besides a widely scattered rural population. The number of schools of all kinds in my district amounted to 315. The time allowed me (and to which I was limited) for visiting and reporting on this extensive district did not amount to more than twelve weeks, of which, however, I lost one through the exigencies of my work in England, and two more through an attack of illness in Cork, which disabled me entirely for the time. My time, therefore, was diminished to nine weeks, a period by no means sufficient to report fully on the different districts, which, although, on the whole, they presented a recurrence of the facts I was commissioned to report on possessed points of difference, from what I could gather, which would not have been uninteresting to contrast in a report.

Plan of operations.

4. I saw at the outset that it was useless to attempt anything like a minute investigation of every locality, and that if I were to confine myself too closely to one or two places, a sufficiently general idea of the state of education in the whole district would not be gained. I therefore selected six of the constabulary districts, and determined to visit the towns that formed their sub-centres, and report on them as carefully as I could, taking some rural schools round them to serve as examples of the state of things in the country. I gave no notice of my visits, but took all schools haphazard, preferring to see them in their every-day working order. The anticipation of an official visit is sure to produce a certain unwonted care on the part of the teachers, which would partly obscure just what I was anxious to see—the schools of the country as they are going on day by day out of sight and hearing. I cannot help remarking here that my experiences, so far, were greatly to the credit of the teachers, as I never but in one instance visited a school without finding its teachers at their posts in the discharge of their duties.

Ready access afforded to all classes of schools and information given.

5. Schools of all denominations and kinds were cheerfully thrown open to me, and any information I wanted was given readily and courteously. The managers of schools with whom I came in contact evinced every willingness to assist me by affording me whatever information they could, and, whether Protestant or Catholic, both teachers and managers were equally ready and equally obliging.

6. I made it a point to call at the houses of the clergy who were in the management of schools, and whenever (which, however, happened but rarely) there was any lay person of sufficient position and intelligence to render his suggestions and information valuable to the Commission, I endeavoured to obtain an interview with him, and if that was not practicable, I sought to attain my object by writing.

Exception—reluctance to express sentiments in writing amongst laity and clergy.

7. But willing as people were in personal intercourse to express their opinions, it was very difficult to get any information by written communication, especially from the laity of all denominations. It is a curious fact that I received but three answers to about eighty circulars which I issued to laymen, and the clergy to whom I sent them did not manifest much more communicativeness, considering their more intimate acquaintance with the subject of my circulars.

8. I do not suppose that this reticence was owing altogether to unwillingness; I would rather attribute it to the want of knowledge that seems to prevail about education, or perhaps want of confidence. Distrust of the Government of England which, they say, has so often issued commissions and made promises, but failed to act upon their reports or keep faith, may account for the apathy and indifference of the Catholics of Ireland; but the same cannot be said of the members of the Established Church, who, however, manifested no greater interest than did the Roman Catholics in the subject of my inquiries. I had very many conversations with gentlemen of different professions and creeds, with private and public men, with upper class people and those of the middle class, and, with a very few exceptions, found that no one possessed any real knowledge about educational matters, and soon discovered that little more was to be hoped for than the barest generalities—"education must be denominational," "the teachers should be better paid," such were the phrases which were repeated to me over and over again, almost without variation, and never with development into details.

Method of visiting schools.

9. It may be interesting to the Commission to learn briefly my method of visiting schools. My first act was to learn the number on the rolls as distributed in classes, and then to make a note of the numbers actually present in each class. In doing the latter, I sometimes would (if I happened to arrive at the hour when the rolls are supposed to be marked) count the numbers present and then compare the results of my counting with the entries in the "Daily Report Book." I do not discover in my note books any memorandum of discrepancy between the two totals.

10. I then inquired the names of the principal teachers and their assistants, and all the circumstances respecting them, such as their training, length of service under the Board, salaries, &c., &c. I then proceeded to extract from the registers such information regarding school-fees, Government grants in salaries, school requisites and gratuities, and other matters as I thought it would be useful to record and report on. Whenever, as not unfrequently happened, I had not sufficient time to make the extracts myself from the registers, I would request the teacher to fill up a form which I left for that purpose. My next step was to examine the children, which at first I attempted to do in every class, but had subsequently to limit myself to a far less number, owing to the pressure of time. After their examination was concluded, I made it a rule to have some conversation with the teachers respecting the subjects on which I thought they would be able to inform me, and in which they were interested. I

endeavoured to make those interviews as unrestrained as I could, in order to elicit an unreserved expression of their opinions; and if the warmth with which I found them ready to express their feelings and make known their wants could be regarded as proofs of success, I must say my endeavours were eminently successful. The time taken up with such conversations varied, of course, in proportion to the intelligence of my informants, and the stage of progress at which my day's work had arrived. As a rule, I came away, if not convinced always of the practical good sense, yet greatly pleased with the intelligence of those with whom I had been in contact.

Method of gaining information from lower classes.

11. I was instructed by the Royal Commission to endeavour to ascertain the opinions of all classes of society respecting the question of primary education. I was not left to conclude from this that my inquiries were to be confined to the educated classes—the direction was explicit in including among "all classes" the "parents of children." It was not difficult to reach the upper classes. The opportunities of social intercourse which the frank hospitality of the people amongst whom I was thrown afforded me were embraced for carrying on my work, and where social intercourse could not be had, I endeavoured to make up for its want, as I have said, by written communications. But with the poorer classes it was very different, and presented greater difficulties; for, in the first place, time was short and did not allow sufficient margin to carry out any regular plan by which I might have met any numbers of them. Then the means of meeting the people in any numbers were not easily obtained. In an English town, especially in the manufacturing districts, there are many institutions in which working men meet in the evening for purposes of self-improvement; it is at such places, and by such means, that a person who is desirous of finding out their thoughts and feelings can attain his object. But in Ireland, there are no such institutions, so far at least as the district to which I was sent is concerned; and in Cork, except the "Catholic Young Men's Association," there is no place where I could have met the people I wanted to see. During the day it was out of the question attempting it; more pressing occupations rendered it impossible. I had to content myself, therefore, with taking the scattered, isolated opportunities which occurred as I drove from place to place, during my sojourns at inns, and in my walks; but on those occasions I derived sufficient information to give me an insight into the feelings of the lower classes with respect to educational matters.

12. But if I failed to come in contact with them personally to any great extent, I cannot say that I left Ireland without knowing something of their feelings, taking them as a whole; for I left that country with the clearest and fullest knowledge of what the clergy think and desire should be done about education; and between the Irish people and the Irish priesthood there is, on all the subjects which are now agitating public opinion, a full and perfect agreement; so that in knowing the mind of the priesthood on any public question, one may be said safely to know the mind of the people. The people trust the clergy, who have never been undeserving of their confidence, and learn from them their politics as well as their morality without doubting. As I walked into one of the National schools at Bandon with its manager, the parish priest, I asked him what were the feelings and opinions of his people with regard to the National system. He replied, looking at me with a sly gleam of fun momentarily lighting up his eye, "Oh! they are very much of my way of thinking." I thought this significant, and found afterwards that those few words summed up the state of things, as far as they apply, wherever I went.

Education valued in Ireland.

13. I believe it may be said with truth, that the Irish really value education. I do not mean to imply by this that there is to be found among the lower classes that consistent conduct with respect to the education of their children which implies the highest appreciation of its benefits. I do not think that such a feeling yet is very general, nor do I think it would be fair to expect such a high moral result in a people who have not yet had the blessings of a widely spread system of education for a whole generation, nor from a system of education which came, though bountiful in its good gifts, stamped with the brand of suspicion—an enemy's gift, that might bear within it many snares. And it is just this fact which to my mind indicates the real earnestness of the people in the search for knowledge. A cautious and suspicious clergy, fed on the traditions of the treachery of Great Britain in all her dealings with Ireland, and taught to believe her most false when apparently most fair; who held in their own hands the power to reject absolutely any overtures that might be made of a suspicious nature, accepted almost* universally an undenominational system of education offered by a suspected Government; and in a short time the schools of this system rose up over the length and breadth of the country under the patronage of the Roman Catholic Church, while the State Church stood aloof. I do not think that any fact can be stated of greater force to prove my assertion that the Irish really care for education than that.

Proved by acceptance of National system.

And existence of "hedge" schools.

14. The "hedge" schools, too, which still linger here and there, but now in less healthy localities than those which gave them their name, and were once literally the only means of education that the poor Irish Roman Catholics possessed, are in their past history a touching proof of the tenacity with which the people clung to the pursuit of knowledge. Many who have died but lately, and who were witnesses of the difficulties and dangers which beset both teachers and scholars have left their experiences behind them in tales which will be handed down to posterity in long years to come. This is not the language of exaggeration. The head of the religious community of those known in Cork as the South Presentation Monks told me that he recollected hearing from an old man, who had witnessed it, of the assembling of a hedge school near Mallow, I believe, which had its scouts out on the elevations of the land round them, of the approach of the officers of the law, of the signal given to warn them, of their flight in opposite directions, and of their re-assembling elsewhere to renew their studies. When it was a penal act for a Roman Catholic to teach or to learn, and when the eye of the law was quick to discover any breaches of its code, it must have been a real love which induced men to acquire knowledge at such risks. These "hedge" schools are quoted in the south of Ireland as an irresistible argument in proof of the value the people set on education.

Increase of National system evidence of Irish earnestness.

15. Had there not been a corresponding action on the part of the people, I do not see how the present National system, which has so many defects in the eyes of the Irish Catholic, could have spread as it has; for had the people been lukewarm about education, it could not have ramified and penetrated so widely and so remotely. I passed through no village which had not one school in it; I examined the map of my district, and found almost every parish with a National school-house marked upon it—even the islands off the coast have their schools, and the thinly inhabited extents of country where no villages exist are liberally supplied with the means of education.

Motives stimulating education.

16. There is a love of learning for learning's sake, for the superiority which it gives to its possessor, and for the advancement in life of which it is the great instrument. All these are strong inducements to become educated, but the latter is, I take it, the strongest of all, and it is the one which is now acting most powerfully with the Irish people to have their children educated. The National system has taught them, by the instances of people who have risen solely through the learning they acquired in its schools, that the way to advancement

* The Roman Catholic Archbishop of Tuam refused to encourage the National system in his diocese.

in these days is the knowledge of reading, writing, and arithmetic. They see in places of importance—at the altars of their churches and filling their pulpits, in professions and in trades, moving in affluence and respectability—people whom they knew as simple boys at the village National schools, and they are not slow to reason from such instances of the advantages of education to themselves and their children.

Emigration to America stimulates desire for education.

17. Another great impulse is being given to education in Ireland by the vast emigration of its people to America. A parish priest said to me on the occasion of my visit to his schools, "The people are doubly anxious to become educated now, as they find that without education they are not likely to do as well in America as those who go there educated." The relatives of people who go to America return with tales of success or of failure in proportion as they are able to read and write. No labour is so valuable in a country where the knowledge of reading and writing is almost universal as that which is educated. There is, besides, a great longing for America among the people. I went from Cork to Queenstown on an afternoon in August, and hired a boat for an hour, the crew of which consisted of an old sailor, and of a fine-looking lad, strong and well developed, with whom I soon made friends and began to talk. I asked him where he had been educated. He pointed to the National school, but did not remain long enough at it, he said, to get much good, as he left, I think he said, in the "Second Book," knowing a little arithmetic, which he had forgotten, and able to write a little. He left school at eleven or twelve years of age. I asked him what he meant to do. He said he would go to America, as he heard through the newspapers that it was *the* place to go to, since a man could always get work there and get on; but he wished he was better educated, as then he would get on better. He said, when I suggested that it was painful to leave one's country like that, "Sure, sir, but isn't Ireland in America?" A gray-headed schoolmaster told me, talking of the grievance of having no pension to look forward to, that if he had no children, he would emigrate to America, where his education would procure him a better living than he could get in Ireland, and save him eventually from the poorhouse in his old age. The Rev. Mr. Lucy, the administrator of one of the mensal parishes in the Roman Catholic diocese of Ross, told me that emigration to America was setting in steadily from his part of the country, and that it was giving a stimulus to education, for the people were getting to know more and more fully the advantages the educated emigrant possesses. They derived this information from correspondence with their friends in that country, and from reading (frequently American) newspapers.

Means used by the people.

18. It cannot be said that, although schools exist, there are no scholars in them. My own experience has taught me quite the contrary. I do not possess amongst my notes, a single instance recorded of a visit to a National school which I did not find fairly well attended. It used to be a matter of wonderment to me where the children came from. I have driven to schools to which there was no village nearer than three miles, and around which I could see no dwellings of any kind, and have found them always well attended. Upon asking the teacher where the children came from, he would inform me that they came from the farms and cottages on the neighbouring townlands, some of them having distances of four miles to go. I used often, as I drove along the country roads, to meet, in rain and in sunshine, parties of children, bare-headed often, and always bare-footed, sometimes racing at full speed, whom I have stopped and asked where they were going, and the answer was always either going to school or going home from school. There may be, and there is, great irregularity in attending school, of which I shall speak further on, but there is no general unreadiness in making use of the school to a considerable extent. When a new school is opened, its rolls are soon filled with scholars.

Contrast between England and Ireland as regards the mixture of different classes of society in schools.

19. In England, the different classes of society move from their school days to their old age in distinct circles; there is no blending of them together at any period of life, and this is particularly the case with regard to schools and education. I am not at all ignorant of the fact that at the great public schools, and at the universities, the youth of very different degrees of rank meet and associate; but that is not the same mixture of classes to which I allude. For, up to a certain point, people who differ very enormously beyond that point as to the accidents of rank or fortune, are, owing to their similarity of culture and refinement of mind and manners, pretty much the same, and may be roughly thrown together into one category, and, so far, may be considered equal. It is lower down in the social scale that the sharpness and distinctness of the dividing line is seen with us, separating class from class. Our schools are mirrors of these classes. In them, in their different gradations, may be seen the various divisions and subdivisions which compose the structure of English society.

20. But in Ireland the case is far different, for although society is there constituted, as it is everywhere, on the principle of gradations in rank, its manner of growth has been very unlike ours, which has been the development of each different class of society in a distinct individuality, with its own ways, its own thoughts, its own social machinery; while in Ireland, the comparative disorganization of society, produced by its numerous social convulsions, prevented anything like a true social growth. And hence it is, I suppose, that there is an almost entire absence of any arrangement of the educational machinery of the country in relation to the different classes of society.

Middle-class education supplied in great measure by National schools and others.

21. Middle class education is almost entirely unprovided for as such, and is supplied by the primary schools under the National Board to a very considerable extent in the towns and in the country, or by the Christian Brothers' and other schools conducted by people dedicated to the religious life, which are really of a primary character. The National Board supplies in the city of Cork, for instance, in its large Model schools, education for the children of people in the higher ranks of commerce, of professional men, of clerks, and of others who belong to the middle class. In the same city there are two National schools under Presbyterian management. These two (the Carmichael) schools, held in one building, were established, I know, to meet the want of a good commercial and (may I not say?) denominational school—despite the love that its excellent manager has for the undenominational character of the National system—felt by the Presbyterians for their children. Another has only lately been opened in what was an old chapel, I believe, by an energetic Presbyterian minister *close to the Model schools*. These schools are, of course, taught by persons who have arrived, although young, at almost the highest point to which a teacher under the Board can reach. It would not have been in keeping with the object of their establishment had they not been thus officered, and they are attended by children of the middle classes principally. The registers give a long succession of records of parents' avocations, which imply the power of paying for the education of their children independently of such aid as is given by the nation to primary schools. In the school I mentioned as just opened, I found that the list of parents' occupations comprised engineers, clerks, well-to-do business men, and the minister of the district figured as the professional man on the list.

22. The same facts may, in a less degree, be stated of the Saint Nicholas parochial schools, which are in connexion with the Board, and have at the head of the two principal departments well educated certificated teachers of the highest grades, who are attractions to the children of the middle class. In this school the number of well-to-do people is not quite so proportionately great as in the Model and the Carmichael and Queen-street schools, but the number of that class in them is sufficiently great to confirm my statement as to the extent to which the middle class is benefited by the primary schools.

23. The majority, however, of the ordinary National schools in Cork and other places where religious communities have established schools contain less of this element, owing to the attractions which the last mentioned class of schools possess for the people. They are more exclusively attended by the class of children they were chiefly instituted for.

Middle-class element in Christian Brothers' and other schools taught by religious communities.

24. This brings me to consider the state of things in the Christian Brothers', the Presentation monks', and the numerous nuns' schools. All these institutions were founded for the purpose of teaching the poor, that is, those who from poverty are unable to provide for their own education; but, whatever the intentions of their founders may have been, necessity has widened the margin sufficiently to include a very considerable number of people who can afford to pay for themselves. So much is the middle-class element now dependent on the Christian Brothers' schools for education, that they have been obliged to consider the expediency of relaxing the rule which excluded Latin from their course of instruction. The excellence of their moral training, and the superior quality of their instruction—advantages which, in public estimation, these schools impart better than any others—are the attractions which draw to them the children of the middle classes. I lodged, when I was in Cork, in the house of a well-to-do confectioner, whose affairs are so prosperous that he can afford to send his family to the sea side in the summer, and has, besides a commodious house in which his business is carried on, a good residence in the suburbs of the city; yet this man has had all his sons educated at the Christian Brothers' schools at the cost of a 1*d.* a week.

The farming class educated in primary schools.

25. The farming class, which comprises many gradations of position and education, is the rural middle class, and, having no other means, depends upon the schools of the National Board for the education of its children, They are more dependent on the National schools than the members of the corresponding classes in the towns, who have the monastic and nuns' schools to fall back upon. Now the members of this class, although many of them, perhaps (in the west of Cork the majority I should say), may be little better off than peasants as regards money, and are in no way superior to them, apparently, in regard to intelligence and education, must, nevertheless, be considered by virtue of their occupation as superior to the mere labouring class. But in all its gradations this class is represented in the primary schools. When near a town in which the Christian Brothers are established, the farmers' children are sent to them in preference to the National schools, or, if a particular National school has a name for good teaching, it is resorted to. Such a case I found at the Ballinora country school, near Cork, where the teaching is supposed by the people round to be better than elsewhere. Farmers' children are sent to it in preference to the schools more conveniently situated from distances of four and five miles.

Principal constituents of National and other Primary schools the children of the poor.

26. But, of course, although the middle-class element is largely represented in the National and other descriptions of primary schools, the larger element in them is that which is legitimately there, namely, the poorer classes, the children of those who are unable to pay for their education.

Occupation of this class in towns.

27. In the towns, the occupations of the people who form this class are such as one would expect to find in places where there are no manufactories or any staple employment. The people are employed in the many uncertain and nameless ways which such towns afford. Carpenters, shoemakers, tailors, and blacksmiths are pretty numerously represented, but these are the only cases, I think, of fixed occupations. The majority of the people are not constantly in employment, and make what they can when they can, which occasions much poverty, and is followed by the payment of irregular fees and, frequently, by the withdrawal of children from school for weeks together.

In the country.

28. In the rural schools I was struck by the small number of agricultural labourers' children on the books, and was, at first, not less surprised to see how numerously, as compared with them, the farming class was represented. It is a proof of how greatly the country has been drained of its population, and of the condition of the farmers generally. The mechanic class is fairly represented; but I am inclined to think that the largest element in these schools is from the farming class. I give some tables which will convey some notion of the pupil element in the Christian Brothers' schools, and the schools conducted by other religious bodies. They are fairly illustrative, too, of the composition of the different kinds of schools in the towns, and also in the country.

29. Upon arriving in Cork, I determined to commence my work in that city, which, with some schools in its neighbourhood not included in the constabulary district, but worth visiting, occupied me nearly three weeks. Had I known more of the National system than I did, my progress would have been more rapid, and I should have had more time left to visit more minutely the rural districts. Leaving Cork, I took Passage West, and then visited Queenstown. I have before alluded to the absence of these places from the constabulary list, and stated my reasons for visiting them. In those districts I visited no rural schools. My next point was Bandon, after which I visited Skibbereen, then Kinsale, and last of all Midleton. My intention had been to conclude with Mallow, taking it on my journey home, but unforeseen circumstances obliged me to abandon the plan. Bandon, Midleton, and Queenstown were so easy of access from Cork that I determined to establish my centre there, going in the morning and returning in the evening to and from those districts. But in the case of Kinsale and Skibbereen I was unable to do that, and was, therefore, obliged to make those places my centres for the time. Order in which districts were visited.

30. In some respects, the period chosen for conducting the inquiry, at least the earlier part of it, was disadvantageous, as so many schools of all descriptions were closed for the holidays, and as it was impossible to get any reliable information about the times at which the vacations began, much time was lost in fruitless visits. Thus in Cork I found the Church Education schools closed while all the others were open. At Bandon and Kinsale the large convent schools were closed, which entailed upon me the necessity of paying a second visit to those places. At Skibbereen as well, the convent school was closed, although I was able to see the rooms and inspect the registers through the Bishop's kindness, and at Midleton I met with the same ill luck, which was not mitigated, however, by a similar access to the books or buildings, as the nuns were in retreat. So far as good weather was concerned, I was most fortunate, not having experienced more than two rainy days during the whole time I was engaged in visiting schools, which, of course, was most favourable for the attendance of the children. Vacations interfere with work.

31. Much time was lost in visiting rural schools, as the journeys to and from them were made not over the most level roads, nor performed on the fastest going cars in the world. But as a rule, I managed, when the schools were not very large, to visit two, and sometimes three, on the same day. My work began, as a rule, at ten o'clock, and did not terminate before five in the afternoon. I have been engaged until six in the evening.

DIFFERENT CLASSES OF SCHOOLS VISITED.

32. The number of schools actually visited was 94, but I am able to report only upon 89, 5 having been closed for the holidays. I am aware that this is below the number I was instructed to visit by the Royal Commissioners, which indeed I would have exceeded, had not the illness to which I have alluded deprived me of a fortnight. Number of schools visited.

33. Sixty were National schools of different descriptions, fifty-one of these being of the ordinary National type, *i.e.*, taught by certificated teachers, and nine were schools conducted by "religious" of different orders and sexes; eight were conventual schools not connected with the Board, four of them belonging to the Christian Brothers, one to the Presentation Monks, and three to the nuns of the Irish Sisters of Charity, the Presentation nuns, and the Sisters of Mercy respectively; seventeen schools were in connexion with the Church Education Society, one of that number being also connected with the Erasmus Smith Board, one belonging to the Irish Society, and one to the Island Society; five schools fall under the head of "hedge" or private schools. The small number of girls' as compared with boys' schools, is easily explained by the great size of the convent schools, and by the existence of mixed schools. There were 18,025 names on the rolls, 10,473 actually present, and a daily average attendance, calculated for the year ending 30th June, 1868, of 10,870, being a proportion of 60·3 per cent. of the number enrolled. Summary of schools. Summary of attendance.

34. The education of the masses, who are Roman Catholics, is conducted in the National schools among which are included the majority of the nuns' schools, but, as in Cork and elsewhere, a considerable number of children are gathered into the schools of the Christian Brothers and certain other communities of women who have either refused, or been refused, aid from the public grant for education. Means of education for, (*a.*) Roman Catholics.

35. The majority of the youth of the Established Church are taught in the parochial or other schools in con- (*b.*) Established Church.

nexion with the Church Education Society, that is, schools which although not necessarily deriving aid from it, enjoy whatever good may be supposed to be derivable from the visits of the Inspectors appointed by that society.

(c.) Presbyterians.

36. A fraction of the Protestant community benefits by the National system, which provides almost entirely for the Presbyterians and Dissenters.

37. Now, while it is quite true, generally, that the National schools are the most numerous, and provide most largely for the educational wants of the country, it must not be forgotten that education, to a great extent, is furnished by the religious orders which, in all the provincial towns which I visited, absorb entirely female education, while in Cork, although as yet unable to accomplish as much as that, they have more than half of the young Catholic population in their schools. The greater number of those schools, it is true, are in connexion with the Board of Education, and therefore count as National schools, but it must be owned to be the National system in a modified form, not indeed modified by any relaxation of their rules, but as regards the teachers, and the principle of extending aid to them.

Education by religious orders extensive.

38. It may not be uninteresting to glance by way of contrast at the comparative number of children in the two classes of schools, the ordinary National and the conventual schools of all kinds. In five districts, the schools which I visited had on their rolls 16,883 names, and of that number the large proportion of 10,316 belonged to the schools of the different religious orders, or nearly 63 per cent. In this calculation I have included rural schools; had I confined myself to the towns the proportion would have been much higher. The details of each are given in this table:—

Proportion taught by them.

Locality.	Total number on Rolls of Schools of all classes.	Number on Rolls of Conventual Schools.
Cork City (and 4 schools in neighbourhood), .	11,720	7,759
Queenstown, . . .	1,156	683
Bandon, ...	1,348	850
Kinsale, ...	1,409	541
Skibbereen, . . .	1,250	483
Total,* . . .	16,883	10,316

Suggestive of their influence.

39. These figures are suggestive of the influence which these orders possess in the towns, and because the towns are the centres of the life of a country, in society at large. It is an influence, however, for which the country should be grateful, since it is one which, whatever defects may be observable in their schools, is always exercised for good.

Bishops favour them.

40. The religious orders have been, or are being, introduced everywhere in the south of Ireland by the bishops, with the view of supplying as much as possible a system with more of the religious element in it than the National schools possess. Nuns being more numerous than monks were more easily planted in all the towns, so that I am not aware of any provincial town in Cork in which there is not a convent and a convent-school. But religious communities of men being fewer, the difficulty of supplying "religious" to teach boys' schools was greater, and their progress has been consequently slower than the nuns'. Still it is not suspended, and the Christian Brothers will in time supplant in the towns of Cork all the National schools. It is to be hoped that by that time their schools will also bear that name. It is an easy thing to introduce these orders in any locality, as the Irish feeling in their favour is strong enough to insure them immediate success. It is not wonderful that this is so, for there is first the reverence, the unusual reverence, which the Irish entertain for any who have given up the world, and have dedicated themselves to the service of God, whether as priest, monk, or nun. Anyone wearing the religious dress is an object of respect; but when, in addition, there are the accompaniments of superior education and manners, unrecompensed service in behalf of others, the care of the poor and the sick, and sympathy and gentleness of word and action, the feeling of reverence soon grows into affection.

Popular generally.

Attractions to children.

41. The nuns combine all those recommendations in themselves. They attract the children by their kindness of manner, by the comfort of the rooms in which they teach them, and by the gifts of food and clothing which are frequently given by the convents. In several convents, it is a daily practice to give a slice of bread to the poor little creatures who would otherwise go fasting for hours. In one convent school, conducted by the Irish Sisters of Charity, I saw a whole pile of little frocks, boots, &c., &c., which had been made for distribution among the children. Then the elder girls are able to fall back on the convents for help when out of place; they secure situations through them, and seem to regard the nuns pretty much in the light of mothers. It is not an unfrequent thing to see in the work-room of a convent girls of twenty or more, who are allowed to remain at, or return to, school until they can find employment. The habits of greater neatness and cleanliness, and the modest and quiet manners which are acquired by the girls at the convent schools are also great attractions to the people. And, above all, the religious part of their education is what is most prized. The same reasons which operate in favour of the convent schools, will also account for the influence of the Christian Brothers, and the Presentation monks. But they have, in addition—especially the Christian Brothers—the advantage of having a high reputation as teachers. At their yearly examinations prizes are given with ceremony, drawings are exhibited, and the newspapers proclaim to the world their praises. And, besides, so many people have risen out of their schools into higher positions, that their education is sought after very eagerly as a more probable pathway to success in life. Besides, the Brothers seem to have, somehow, the art of making their scholars religious and good. In their schools in Cork all the boys, I was informed by the superior, go to confession and communion once a month. One of them whom I engaged to do some work for me in Cork lived at Blarney, and wanting "to go to his duties"† in Cork, rose at three, he told me quite simply, in order to arrive by five o'clock at the church, at which hour he must have attended, or have foregone that opportunity.

Special attractions in Christian Brothers' schools.

Moral influence secret of success of these schools.

42. I believe that the moral influence of all these institutions is the great secret of their success. If any—too many, I fear—leave their schools imperfectly instructed, they leave with what is better, a regard for the virtues which they saw in the daily lives of those by whom they were educated. I speak of all schools taught by religious, whether under the National Board or not.

* In this total all schools are excluded except those of the National Board and the religious orders.

† A common way among Catholics of expressing their approach to the Sacraments of Penance or the Eucharist.

43. There are eight of these schools which are not in its connexion, but two of them are involuntarily shut out from it, while the other six have made no attempt, not having the desire, to obtain State aid. Three of them are nuns' schools. Number of Conventual schools unaided.

44. Of the two to which aid was refused, one is a school taught by the Sisters of Mercy in Blarney-lane, Cork, and known by the name of St. Mary of the Rock, and the other is the new boys' school, lately built by the Presentation Monks, and known as the Greenmount Schools. The refusal to aid these schools is very justly considered as arbitrary and tyrannical, since they were both built by private charity, and are attended by the very poorest class of children in Cork—a refusal which is harder to endure when aid is given to endowed schools and to Presbyterian schools, which is either not needed at all, or not so much required as by those to whom it is refused.

45. The schools which voluntarily remain aloof are those under the Presentation Nuns, the Irish Sisters of Charity, and the Christian Brothers. The former community is the oldest I believe in Cork, and keep up the old traditional fear of anything connected with Government. They received me, however, most heartily, and gave me the freest access to their schools. They were determined, they said, never to have anything to do with the Government.

46. The Irish Sisters of Charity seem simply not to care about having Government aid, although they did not express any strong dislike.

47. All the schools of the Christian Brothers remain aloof from State connexion, and are unlikely ever to seek it under the existing condition of affairs. I visited four of them, three in Cork, and one in Midleton.

48. The number of children present in these seven schools on the day on which the education census was taken amounted to 3,384, distributed in the different classes of schools as follows :— Number present in these schools on 25th June, 1868.

Christian Brothers,	2,035	in four schools.
Presentation Brothers,	206	in one school.
„ Nuns,	540	„
Sisters of Charity,	415	„
Sisters of Mercy,	188	„
Total,	3,384	

Deducting 397, the number of boys in the Christian Brothers' school at Midleton, we have 2,987 as the number of children taught in the "religious" schools in Cork not connected with the Government, the Midleton school being the only one in any of the provincial towns visited by me which does not derive assistance from Government grants.

49. It may not be useless to say a few words on the relative efficiency of the two classes of "religious" schools, namely, the aided and unaided schools. It is difficult to make a fair comparison, since each community has its own ways and methods of action, and there are no such relations existing between the different orders which would tend to produce uniformity. Each goes on its own line, which never seems to intersect the path of any other. But broadly speaking, the difference between them is the presence of some system to work by in the Government schools, and its absence in the non-National schools. Efficiency of aided and unaided religious schools, former better than latter;

50. I must except the Christian Brothers to some extent, as they do make a study of their work, and go by system and method, although, in some respects, I believe their system to be defective. The possession of some rule to go by affects principally the instruction of the scholars, who are taught according to a fixed programme adapted to the different classes, and which, while it does not secure any brilliant results, owing to a defective method of inspection, does at least secure some definite plan by which advance is made in each subject of instruction *pari passu*. Then the advantages of having an uniformly graduated series of books at a cheap rate, of obtaining a good supply to begin with of maps, diagrams, &c., are such as combine to render the schools which possess them more efficient than any others. The visits of the Inspector, too, must have, more or less, a tendency to secure a due attention to secular instruction, since he measures, or ought to, the efficiency of the school not by the glibness with which the children can answer questions in the catechism, but by their ability to read, write, and cipher. Some knowledge, too, is expected to be shown of grammar and geography, which must, therefore, be taught. In these respects the unaided schools are greatly wanting; they appear to have no system, no method. The knowledge imparted is superficial and with great difficulty extracted from the children, who besides do not make concurrent progress in the staple subjects of instruction. A child able to read the Third Book of the Board would probably be unable to work a sum in subtraction, or if able to work a sum in multiplication would be quite unable to write from dictation on a slate a few simple words. Their supplies of books are inadequate, because being obliged to buy themselves at market prices, they must sell to the children at the same rates, whose poverty prevents them from buying. They have no periodical test applied to their schools by which they are able to discover how they stand, and, being isolated from intercourse with the world, have no means of learning by comparison their excellences or their defects. They put me very much in mind of a ship sailing without a compass, and without the stars. I do not mean to insinuate that persons of such devotion and moral worth need the spur to be applied to make them work; I mean only that their defects are the necessary consequence of their isolation. Christian Brothers excepted.

51. I have said that the Christian Brothers' schools form to some extent an exception to the general condition of the unaided schools, and in what respects they are so. Still they are not free from some of the defects which must always exist in isolated positions. Most of those defects are owing to their want of teachers, I know; but that is a want which, if they were acting in union with a National scheme, would soon cease to be felt, since they would be able to supply it by the employment of efficient paid monitors, or pupil-teachers; and their scholars would advance in each subject of instruction at an equal rate of progress in each. The great efficiency of their upper classes, however, is a proof of what they would do throughout their schools, if only they had the means.

52. I must not be understood to imply that the National convent schools are perfect. I only meant to say that they contrast favourably with the non-National convent schools. They are, as a rule, far from perfect as regards the efficiency of their instruction. I hope I shall not seem unkind, or not duly to appreciate the labours of these devoted people. It is, however, necessary to state facts as I saw them for the good of all parties concerned. The nuns are engaged in a vast work, which, if it has a relation to the eternal, has, at the same time, though a less, yet not an unimportant relation to this world. They are engaged in preparing many thousands of individuals to fight the battle of life, which, to do well, requires good instruction. The masses of people are becoming more educated every day, and individuals are valuable in proportion as they are educated. It is therefore most necessary that those who have the instruction of the rising generation National convent schools not efficient.

Importance of efficiency.

should do it well. It is for this reason I desire so earnestly to see the convent schools efficiently taught. The results of my examinations of these institutions were not satisfactory. Time is spent, and labour is expended, and there is not as much to show for it as there should be.

Reasons of inefficiency.

53. What are its causes? First of all the teachers are not really teachers in the strict sense of the word; they have never been trained to teach; they have never in the majority of cases prepared themselves for it, nor given any proof of their capacity. There is too much of the feeling that the religious habit and profession brings with it the power, as it does the willingness, to teach others. Next, there are no fixed teachers in charge of the schools, which, being conducted by different individuals, precludes the existence of responsible authority, and is fatal to the existence of any system being fully carried out. In the afternoon, the morning's work is undone. The various duties that devolve upon the same nun during the day is urged as the necessity for this. But in England it is found quite possible to employ some members of the communities exclusively in the schools. Why should the same plan not be adopted in Ireland? Too much, besides, is thus left to the monitors, who are employed throughout the whole day in the schools. The consequence of all this is that instruction stagnates. It is melancholy to look into the registers of these schools and see the ages of the children composing each class. In the first class an average of seven is the constant record, in the second of ten, in the third of eleven, in the fourth of fourteen, while the amount of knowledge possessed by the junior classes does not at all reach up to the standard of children of the same age in the English schools, although the intelligence is all on the side of the Irish child. The table in this report in which I have analyzed the results of my examinations of the convent schools will show how poor are the results.

Remedies: test of examination objected to.

54. The remedy for much of this want will be found in requiring the nuns to submit to some test of their fitness to become teachers. I am alluding to a matter about which they are not unnaturally a little sensitive, namely, being required to pass an examination before being allowed to teach at all. The idea is repulsive in the extreme to all the nuns, and finds no favour at all among the clergy or laity, and it will be a matter of difficulty to overcome their prejudices. There is something repulsive in the idea to the Irish mind of submitting nuns to such a test; the imagination pictures a large assemblage, staring looks, and suspicious and scrutinizing examiners, and the conception of the scene shocks the feeling of delicacy more than it can bear. I was several times asked by the nuns how I would like my sisters or any female relatives to be subjected to such a process? It was impossible to deny the shrinking which one would feel; but my answer was that I could see nothing more humiliating in it than in a delicate woman undertaking to brave all the horrors of a hospital, or a sick room, or in washing plates and dishes, which are the frequent occupations of nuns. After having made in the first instance such great sacrifices, I was unable to see the difficulty or degradation of undergoing an examination.

Examination might be conducted in exceptional way.

55. But the examinations need not be public, they might be conducted in a convent, with none but the nuns present; or it might be conducted in each particular convent, in the presence of the parish priest, or any person the bishop might suggest, and the Inspector, who would, of course, always be a Catholic, would assist. If these schools expect aid from the State on the same scale as the ordinary schools of the country, surely it is not unfair to expect them to give some guarantee that the public money thus laid out shall produce certain results. I may mention what I was told by the superior of a convent in the course of a conversation which, relating to education generally, touched on the question of the necessity of having properly educated teachers, to show that I am not exaggerating the importance of this matter. She told me that she found it necessary in the case of almost all the novices to send them back to school; that they were so superficially taught as to render it necessary, in order to make them useful in the schools, to recommence an elementary course of study. She is not one who thinks that knowledge comes with the three vows or the black veil. But, notwithstanding, she was one of those who spoke most strongly against the examination of nuns. She, with a clear perception of the value of being soundly taught, takes care that the members of the community who have to teach learn how to do it. But I should like to know how may superiors even see its necessity?

56. I hope, however, and trust that the nuns who have, with so much generosity, sacrificed so much already, and are, besides, so full of an enthusiastic patriotism, will not, upon seeing its importance to the education of their country, flinch from making one act more of sacrifice. It will be one of their highest rewards to have helped to prove that culture can go hand in hand with the deepest Catholic piety. If, however, the objection is insuperable, I do not see that less can be done than to insist that they consent to have duly certificated and trained teachers in their schools, to whom the State might look for their efficiency.

Practice of changing teachers should be abolished.

57. I have noticed the practice prevalent in the convent schools of employing a number of teachers who succeed each other in relays of two twice a day, instead of having the same teachers constantly employed, and I noted it as injurious to real progress. It is hardly, I suppose, necessary to say anything to prove it, as it seems self-evident. I am anxious only to suggest that some better plan should be adopted, and that the monitors should not have the care of the registers so much to themselves, as they seem to have in the Government schools. With one exception, I did not visit a convent school in which I received any information as to the attendance of the children from the nuns; it was all left to the monitors. It seems to be quite out of the order of propriety that the school records should not be kept by the superiors of the schools. Of the details regarding instruction and discipline in their schools I shall speak farther on.

58. I close these remarks by observing that, while not equal to the general run of the National schools as regards instruction, the convent schools are in every way else superior to them. A tone pervades them which I should be glad to see more prevalent in the National schools.

Kinsale Convent National school; buildings, apparatus, &c.

59. I cannot forbear giving here a short account of the Kinsale Convent School, of which frequent mention is made in this report, as it shows what might be done for education in the convent schools. It forms part of the buildings which belong to the Sisters of Mercy, and which comprise, besides the school, the convent itself and an orphanage. The buildings are well situated in every respect, and the school-rooms, three in number, besides two class-rooms, are lofty, well ventilated, lighted, and furnished, and patterns of neatness and order. Apparatus of all kinds is plentiful and good. In one of the school-rooms are glass-cases containing geological and other specimens. The school was just re-opened after the holidays, and the attendance was therefore not so good. 313 however, were present, of whom 86 were infants between two and five years old. The superior takes charge of the infants of working-women during the day. There was a little bed in a corner of the infants' room, in which they are put to sleep. There is a room in which the girls who come late to school and are too old to be classed with the others are taught, the object being to give them as much instruction as will enable them to read their prayer-books and write fairly, but they are taught needlework carefully. It is a plan very commonly followed in the convents.

Attendance.

Young infants taken.

Room for backward girls.

Instruction. Infants well taught.

60. I examined girls of every class, and found them all soundly taught, the greatest successes being attained in the junior classes. I was particularly pleased with the instruction of the infants, who were the best instructed I met with anywhere, coming quite up to those in the best English Roman Catholic infant schools. It was curious to observe the power of imitation in the little children; when reading they seemed almost to lose their

accent, certainly managed the *th* sound, gave full value to *i* and *e*, and read surprisingly well. But when the reading was over, and the occasion for imitation ceased, nature asserted itself in the finest brogue. One or two of them recited little bits of poetry very prettily. Discipline was admirably maintained throughout every class. Discipline. I saw a large number of girls writing, and their simultaneous obedience to the directions of the nun in charge, Writing class. given by signs, was done with military precision. The eyes of the girls were fixed on their work, they were minding their business although a stranger was present. Organization seemed to be fully attended to. Each Organization. class had its portion of the reading lesson for the week written on a card with the monitor's name upon it, so that every girl knew by looking at the card where she would begin on Monday, and how much she would do during the week.

61. Needlework, plain and fancy, was very carefully taught, lace making seemed to be also taught with success, Needlework. but I was pleased to see that the majority were learning plain sewing. The girls of the fourth and fifth classes had each a little bag or case in which samples of work were kept, which were exhibited to me by each girl, who is subjected to a similar overhauling periodically by the mother superior. Each girl had also a case in which she kept her exercise, account, and other books, all with greatest neatness. The girls are taught accounts sufficient for domestic purposes. Details were so carefully attended to that one felt confident in the excellence of the whole.

62. Original composition is regularly practised, and the girls (the upper ones) have acquired a considerable Original composition. facility in writing letters. I was very much interested with one letter, perfectly simple, written by an orphan girl, whose appearance did not betoken much intelligence. It was supposed to be written by a solitary being in the moon, and, for a girl like her, was a very respectable piece of imaginative writing. There was nothing forced or unnatural in it, the conception was good, and its manner of expression fair. Much of the success of the Success due to superior prizes. school is owing to the personal attention which the superior bestows upon it. She gives prizes, and has "judgment days," when the conduct of each girl is reviewed by her, all which stimulates the children. The school has much fallen off in numbers since the tide of emigration has commenced to flow again towards America, and its Numbers fallen off. attendance has diminished from nearly 600 down to not much above 300. In this school twenty-three nuns are employed, not continually, but at intervals in the day, and ten paid mistresses under the Board, besides twenty- Teaching staff. one others, some of whom are paid by the nuns, and others are unpaid. I must not forget to add that crotchet was once taught here so extensively that £1,100 was realized in one year by the sales; it has been given up as it had a tendency to make the girls idle and gossiping after they left school.

63. Particular care is paid to the instruction of the monitors, who compose the fifth class. Their instruction Monitors. is conducted with the view to make them efficient teachers, and so they receive a kind of training better than most of their class. Most of the female National teachers have been monitors in the nuns' schools, and in this respect it is important that the nuns should be rendered more efficient than they are, since they thus not only directly act on the education of the country, but indirectly by forming the minds and characters of its secular teachers. In seven schools there were no less than seventy-three monitors; this is a sufficiently large number to make the question of their education an important consideration.

64. The convent schools are of great extent, both as regards accommodation and actual attendance. Convent schools large. The South Presentation Nuns in Cork have a school with 1,228 on the books, and an average attendance of 645, for a greater number than which, however, they have no accommodation, which occasions much over-crowding when the weekly average attendance rises, as it does in every school during certain weeks of the year, above the annual average. The school attached to the Convent of the Sisters of Mercy in Fitton-street, Cork, has no less than 820 children enrolled, of whom not more than 367 can be counted as in average attendance; the school has accommodation for 485. The Blarney-lane school had present in it 204, the usual attendance being 284; the building could accommodate 700 children. No registers are kept, and it is, therefore, not possible to give the number on the rolls. The school at Bandon, conducted by the Presentation Nuns, with 636 on the rolls, records an average daily attendance of 396. The school at Queenstown of the Sisters of Mercy, with an average attendance of 469, contains on the rolls 683 names, with accommodation for twice that number. But these instances are sufficient to show how large these schools are, and how—divided as the buildings are into compartments—impossible it is that they should be well worked without some more responsible and efficient teacher at their head. The convent schools are particularly useful to the clergy, as they relieve them of the religious instruction of the children, which is very efficiently seen to by the nuns.

65. I visited 7 schools conducted by religious men; 6 of these were in Cork, and 1 in Midleton; 4 of them Monks' schools. belonged to the Christian Brothers, and 3 to the Presentation Monks. The former community has been settled Christian Brothers in Cork. in Cork for nearly half a century, and has gained respect and influence by its usefulness to the community in establishing schools in which the children of all classes of the Roman Catholic body are able to receive a good religious as well as secular education. Much, too, of the favour with which they are regarded is owing to their fearless assertion of nationality, combined with a spirit of submission to the Government under which they live. I have elsewhere explained the reasons of their popularity as teachers. They educate in Cork nearly 2,000 boys, of whom 1,610 are in daily attendance, thus making their schools the best attended in Cork, or indeed in any locality; and although their school at Midleton was not more than a year open when I visited it last year, it showed the same excellent attendance. They have a name for excellence, and are run after eagerly, which accounts for the good attendance; but the brothers themselves pay much attention to ensuring regularity. In Cork it is known to be the rule in their schools, and everybody acquiesces in it. A good deal of this regularity is owing besides to the superior class of children who are to be found in them.

66. There are three Christian Brothers' schools in Cork—the Peacock-lane, Blarney-lane, and Sullivan's-quay schools. They are in well chosen situations, two of them being in high open spaces commanding a view of the city, while a third is on the opposite side of the river in Cove-street. The Peacock-lane school School at Peacock-lane. forms part of the central establishment where the brothers reside. Good playgrounds stand at its back, in which excellent offices are built; and a slope of green pleasure ground, prettily planted with trees and ending in a neat flower garden, reaches up to the monastery itself, which, with the schools, are freehold property. Some farming land is, I believe, attached to it, and helps to maintain the brothers. It is the largest school in Cork, containing eleven departments, in which 993 boys assemble every day for instruction. The accommodation is ample as to space, and good in other respects. The rooms are all simply, but fully and suitably, furnished with desks, forms, maps, diagrams, &c., &c. Models are furnished to facilitate the study of mensuration. A good room for drawing is filled with boys, who learn mechanical, architectural, freehand, landscape drawing, &c., &c., including painting. The walls are hung round with specimens which have been done from time to time by former pupils. There is also a large hall in which their annual distribution of prizes takes place—the gift of an old pupil, who attributes his success in life to the teaching he received at the Christian Brothers' schools. There are other equally touching evidences about their

house and grounds of the gratitude of the people who have been educated by them. Thus their chapel altar was furnished by one, another gave the statue which stands in the garden, and so on. Blarney-lane school is situated on the same side of Cork, and has not very long been opened. It is a fine building in many respects, and is a monument of the charity of the Messrs. Hegarty, who subscribed largely to, and aided in, their erection in every way. It is held in trust, I believe, for the brothers, and has an average daily attendance of 439 scholars, who are accommodated in four rooms. The Sullivan's-quay school is, as I have said, on the other side of the town, and is attended daily by 350 of the poorest children in Cork. The buildings are inferior to the others, but are not deficient in essentials. The greatest defect in them was the want of space in the room in which the younger children were taught.

Blarney-lane.

Sullivan's-quay.

Education free.

67. The majority of the boys receive an entirely free education, which the payment of one penny a week by a few boys does not prevent me from describing as one of the characteristics of the Christian Brothers' schools. The whole amount of fees received from 1,610 boys was, at the beginning of last year, only £129, being an average payment of 1*s.* 7*d.* a year by each boy. The amounts obtained from that source are always expended on the buildings, and in the purchase of prizes, &c., &c. True to their principle, religion is made the chief thing, and the day begins and ends with prayer, which finds a place during the day in short ejaculations when the clock strikes, in making the sign of the cross, &c., &c. The best is done for the education of the boys possible, and if the results in the majority of cases are not commensurate either with the ages of the pupils or with the intelligence and devotion of the teachers, it must be attributed to the want of a sufficiently large teaching staff.

Fees.

Religion.

Upper class.

68. The upper class in their schools is always a large one, and is always well taught. Euclid, algebra, mensuration, and sometimes the higher mathematics, are invariably learnt, together with book-keeping, which latter art is a great recommendation of their pupils in the eyes of merchants, who, in Cork, are frequently supplied with clerks from the Christian Brothers' schools. Mr. Duggan, the superior, told me that he had more applications than he had boys. Mr. Murphy, one of the members of Parliament for the city of Cork, said in substance much the same, and added that the trustworthiness of the boys who came from that school was one of the reasons they were in such requisition. Their school at Midleton had been open only a year when I went there, but had already 502 boys on its rolls, 399 of whom were in daily attendance. There were present 350 on the occasion of my visit, and of that number 64 were already in the Fourth Book, but most of these boys had been educated originally in the ordinary National schools round Midleton, which were being drained by the attraction of this school. The National school there has disappeared entirely, although the advent of the Brothers has entailed an expenditure on the parish of £2,500 in erecting buildings, and the necessity of raising yearly £150 for their maintenance.

Midleton.

Christian Brothers' schools unpopular with National teachers.

69. The National schoolmasters naturally regard these schools with anything but favour, as they not only drive them out of the field wherever they appear, but deprive them of their best pupils when within reasonable distance. The superior of the Midleton school pointed out to me boys who had come from Cloyne, five miles distant, and did it daily, although there is a good National school at that place, as I can amply testify. The extent of the drain on the surrounding localities will be better understood if it is borne in mind that, at a high estimate, there are not more than 246 Catholic boys in the town of Midleton who should be at school, so that 156 children are being drawn from the neighbourhood round to this school. It is the only school conducted by "religious" in which I met with Protestants, of whom there were four, a fact which so roused the zeal of the vicar that he informed me he meant to build a school of three departments, in order at once to be able to induce the parents of these boys to withdraw them from such dangerous influences, and to prevent the possibility of its recurring; having, I suppose, a not incorrect notion that the deficiencies of the educational arrangements in his own parish were the cause of the children being sent to the Christian Brothers. At the utmost, there are not more than 26 children in his parish of a school-going age, for whom three departments are to be built, so that dividing equally, there will be 8·6 children in each department. Lord Midleton was going to subscribe, or had subscribed, I was informed, to their erection.

Presentation monks.

70. The Brothers of the Presentation Order form a small community, not having more than two houses, one of which is in Killarney, and one in Cork, in which city they have three schools, all of which I visited, but examined only one, owing to pressure of time. Two of these are in connexion with the National Board, and one is not. The former have long been established, and are situated, one in Douglas-street, and the other at some distance from it in a poor neighbourhood. They are known in Cork as the South Monastery and the Lancasterian schools. The former name explains itself, and the latter is derived, it is supposed, from the famous John Lancaster, who once visited the school. The third school is called by the Brothers the Greenmount school, but, perhaps, is better known among the people by the ghastlier name of Gallows-green school.

71. They educate about 1,050, on the average, of the poorest children, and charging those who can pay it 1*d.* a week, form a little fund, out of which their schools are supplied with ink and copy-books. The school which I examined is very fairly taught and disciplined, but there are the usual defects in the lower classes, counterbalanced, however, by their successes in the higher. The numbers in the fourth class were, in the Lancasterian school, small, not more than 50 out of 465 being in it, or not quite 11 per cent. out of the whole number; the proportion in the First Book being 43·4 per cent., which brings the school down pretty nearly to the same level with the ordinary National schools in this respect. The school-rooms at Douglas-street are not amiss either as regards size and ventilation, and are furnished adequately; and if the furniture looks worn and old, it must be recollected that it has been in use unchanged for forty years. The infants' room is decidedly bad in every respect. Over each of these rooms, containing, on an average, 120 boys each, presides a monk whom a paid monitor assists, besides unpaid monitors. There are class-rooms in each of their schools. The higher classes are taught mathematics, drawing, and composition; the latter they do very creditably as well as the former, and some of the specimens of drawing which were exhibited were promising. A class-room is kept for drawing. Although much kindness is shown to the boys, they fail to come regularly to school, their irregularity being quite as great as that of any National school.

72. The Greenmount school is new, and was built in the hope of getting aid for it; but the monks were disappointed in consequence of the resolution which the National Board made some years ago of no longer assisting monks' schools. The school-rooms, which are good in every respect, need furniture to make them cheerful and comfortable, which help from the Board would have enabled the monks to procure more easily. They possess room sufficient to accommodate 860 children, and the three schools together have sufficient room for 2,457 scholars, including class-rooms, or more than double the attendance. There is an orphanage attached to the school.

Established Church National schools.

73. I visited seven schools of the Established Church in connexion with the National Board, and attempted to see an eighth, but was disappointed. Six of these are the parochial schools of the parish of St. Nicholas in Cork, and are situated in different buildings in a courtyard. The school seems to have arisen out of the bequest of £166 15*s.* 10*d.*, left by a certain Moses Deane for the education of forty poor Protestants, which, however,

while fulfilling the object for which it was given, was [wisely] made, in Dr. Webster's words, to do the work of entirely "supporting the parochial male and female schools." That was prior to the withdrawal of the schools from the Church Education Society and their connexion with the National Board, which took place in 1859. I found on the rolls of five of the schools, in August, 1868, 332 names, and an average attendance of 185. One department was closed, but the attendance in it was small, I was informed, and the number on its books would not make more than a total of 372 on the rolls, and an average of 212 for the six departments. Dr. Webster, in his address, dated January, 1868, says that in '67 they had 511 children on the rolls, so that the numbers would have, in the course of seven months, diminished by 130. According to the returns of the National Board, extracted from the Thirty-Fourth Report of the Commissioners, I find that for the same period the number on rolls, for the five schools, exclusive of the one closed, was 468, and the annual average 185, thus creating, after only seven months, a difference of 136 in the numbers I found on the rolls, and a difference of 15 in the average attendance. I am quite unable to explain this difference, which really is a difficulty, since the children attending those schools are the regular inhabitants of the parish. Had the model schools been only just opened, I should have been able to attribute it to a sudden migration of a number of children to them, but they had been established long enough for any great exodus to have taken place before my visit. I found that the grants, exclusive of books, amounted to £189, being at the rate of more than £1 per child, or double the average grant to every description of school.

74. No objection appears to have been raised by the authorities in Marlborough-street to such an unnecessary multiplication of departments on the same spot on the ground of the unnecessarily extravagant expenditure it entailed. The male and female infants, only 136 in number in all, might be taught in one room very efficiently by one mistress and a monitor, seeing that their united daily attendance did not amount to more than 82; and, similarly, the girls and boys in the preparatory schools might very advantageously be taught in the senior schools. The expense would thus be lessened by half, and no injury inflicted on the schools. Their patron, Dr. Webster, seems to have become aware of the needlessness of so many schools, and had, I was informed before I left Cork, determined to abolish two of them by amalgamating the two preparatory with the senior departments.

75. The instruction in the infant schools wanted animation and vigour, but they were not, on the whole, unsatisfactory. The preparatory boys' school was very poor, while the upper was satisfactory in every respect except good discipline. A first class master is employed in it, and teaches with much intelligence and success. He is careful to have home tasks done, which are either exercises in composition or in arithmetic, and book-keeping or mathematics, and makes Saturday the day for their revision. Of apparatus there was abundance of every kind, but the furniture was not above the average. Warmth, cleanliness, drainage, &c., are most carefully looked to. I was pleased to see, from Dr. Webster's statement, that so much interest is taken in the schools by the parishioners, who subscribe towards their support. The subscriptions have been steadily rising. According to a printed statement, they seem to have risen to nearly six times their original sum. In 1855, they were only £6 13*s.*, in 1867, they were as much as £38 15*s.*

76. At Ballintemple, about two miles out of Cork, there is a National school, which was formerly connected with the Church Education Society. It is the school for the members of the Established Church of that district. It is held in a room in the master's house, which makes as good a school-room as it is possible to have under such circumstances; and if it is cramped and incommodious, it is in good repair and not wanting in the essentials of air, &c. I found 13 boys and 20 girls on the rolls, making in all 33, of whom 23 were present. There were 26 members of the Established Church, 5 Catholics, and 2 Presbyterians on the books. The annual average was 24. The master's salary amounted to £48 12*s.*, including £3 allowed for coals. The manager contributes £18 towards his salary, and gives him a residence rent free. The children were dull and poorly taught. Ballintemple.

77. Having been informed that there was a small National school in the village of Blarney, I paid it a visit. I drove through the village, and the usual regulation board caught my eye over the door of a small house, which, from its size, I judged to be the place I wanted to see, and so it was. I knocked, and a young man came to the door, to whom I explained my mission. He at once expressed every willingness to give me all the information he could. It appeared that the rector of the parish (Garrycloyne), Mr. Perrin, wishing to afford his parishioners the means of education, which they are unwilling to receive in the National schools because they are conducted by Catholics, obtained a house from Sir George Colthurst, converted it into a school, and succeeded in inducing the National Board to take it into connexion. A free stock of maps of the value of £4 was given, and the privilege of purchasing books was granted, with the advantage of inspection. The master was trained at Bandon in the Church Education Society's training establishment, and was classed. He is organist and clerk, and makes, together with his school fees, amounting to £16, £48 a year, and has furnished apartments given him, with a small bit of garden. There were on the rolls five boys and six girls, and an average attendance of 4·4 children. Eight were of the Established Church and three were Presbyterians. The report of the Commissioners gives no returns from this school, but mentions merely that they were not available, which is done likewise in the case of a school in Ballymartle parish of similar size, or perhaps smaller, but about which, as I did not visit it, I cannot say more than that there were nine children present on the day on which the school census was taken last year, two of them being Catholics. Blarney.

78. Of Presbyterian schools connected with the National Board only four were on the Constabulary lists, which, however, did not note them as connected with any religious body. But one at Queenstown, and another opened in Cork after the Constabulary lists were made out, brings the number up to six, although four only were actually visited, owing to vacations, my want of time, and the closing of one building for repairs. The first visited were the boys' and girls' departments of the Carmichael schools in Cork, which are frequently mentioned in this report. They were built not really to meet any existing need among the poorer Presbyterians, but to supply the want of a commercial school for the middle class children of that body, who were previously dependent on private schools, which the clergyman wisely thought undesirable.

79. Mr. Carmichael, a wealthy member of his Church, contributed the necessary funds, and a pretty but small and badly-ventilated building, in the Gothic style, was erected, in which two departments were organized with no other separation than a green cloth curtain between them. In appointing teachers, the object of middle-class education was steadily kept in view, and a master and mistress, each of the first class—the master being of the highest grade of that class—were engaged, able to teach, besides the ordinary subjects, drawing, singing, and physical science. The fact that only three children out of 166 on the rolls are free, and that sixteen others pay their fees quarterly in advance, which amounted for the year ending June 30th, 1868, to £88, the average attendance being 115·9, will show how almost exclusively the school is attended by the children of the middle classes. The master, from the north of Ireland, is much superior to the ordinary run of the National teachers, and much better educated, as was also the mistress.

80. The salary, from all sources, of the former was £121 19*s.* 9*d.*, and of the latter £73 16*s.* The Government grants amounted to £132 15*s.* 10*d.*, and, putting the average attendance in round numbers at 116, the

education of each child was costing the public £1 8*s.* 0½*d.* In no other class of National schools is the average grant so high. This inequality is the result not of unfairness, but of paying for the education of children not according to one uniform fixed rate, dependent on results, but according to the master's acquirements.

81. On referring to the returns of the National Board contained in their last report, I find that while the number on the rolls at the end of 1867 was 206 as against 166, seven months later, the average attendance was 117 as against 116, the grants being £99 5*s.*, as against £132 15*s.* 10*d.*, making a difference of £32 10*s.* 10*d.* at the time of my visit in excess of the amounts returned as granted at the end of 1867. This difference is worthy of remark, considering that the average attendance was lower by one at the end of June. In the boys' school, there was an assistant and a monitor, and in the girls' school, there were two monitors, the elder of whom was to be appointed assistant immediately.

Bandon.

82. There is one Presbyterian school in Bandon which the Board aids. It is in Watergate-street, and near to another National school in connexion with a dissenting body. I endeavoured to see them but failed. These facts about them are remarkable. With respect to one of them it appears that when the census was taken in June, 1868, not more than 39 children were present, which at that time of the year would represent about the daily attendance, but it is returned by the Board as having 109 on the rolls, with a daily average attendance of 50. The other school which is returned as having fifty-two pupils on the rolls, and an average attendance of twenty-two, and as having received £26 in Government grants, had in attendance only sixteen children in June, 1868. Now, in Bandon there are only 85 Presbyterians according to the Census, and 285 Methodists and other dissenters. Taking one in six of them—a very high estimate—as the proportion of the population who ought to be at school, there would be of Presbyterians 14·5 school-going children, and of the others 46·8. But two separate schools are maintained for these different bodies. Complaint reached me against the National Board of their unfairness in allowing Presbyterians and others to have their own schools without limit as to numbers, while they refuse the same privilege to Catholics.

Queen-street school, Cork.

83. The Queen-street school is entirely new, having been opened only a fortnight before I left Cork, and not much more can be said of it than it is a mixed school for the establishment of which I could see no reason whatever on the manager's principles of non-denominational education. Its rolls record none but the children of people who could pay for their education apart from the aid of a primary school, which, besides, is doubly useless, as the model schools are not a mile from Queen-street, and there is sufficient accommodation in the Carmichael schools for all the Presbyterians in the town. There are 63 on the rolls, and of that number 20 were members of the Established Church and could go to the St. Nicholas' National schools, which are equally good, and the forty Presbyterians would find equally good teaching and accommodation in the Carmichael schools of their own Church, if they disliked the Model schools. But without asking a question, the National Board has established another Presbyterian school in Cork, to which it will pay at least £35 a year, while it has refused aid to establishments which are struggling to educate hundreds of poor children.

84. The following table will give an idea of the comparative expensiveness of the National schools of which I have been speaking. I include the St. Nicholas's schools.

Name of School.	Denomination.	Average attendance.	Government Grant.			Payment per head.

Church Education Society

85. The schools of the Church Education Society take the next place in importance after the National schools, as being those in which the youth of the lower classes of the Established Church in Ireland are educated. They are important, too, inasmuch they are the evidence of the strength of religious conviction and feeling on the part of the members of that Church, and they seem to be one of the proofs of the necessity there is to adopt some recognition of definite religious teaching in the educational system of the country, if it be desired to gather all the different denominations under the influence of a central system, which alone, besides its other advantages, will make the instruction of the masses of the people efficient. And if it is desirable that none of the Roman Catholic educational machinery should be alien from the State, so is it equally desirable that none of the Protestant communities should remain apart from any great national movement with respect to education. And if it is important now, in a temporal point of view, that education should be sound, and that time should not be wasted in its acquisition, I think that they should be put into some way of becoming efficient.

86. In any other sense they are not important. They are small, and produce the very smallest results. Despite all the efforts that have been made to maintain and diffuse good education in the Irish Established Church by them, success, in the sense of educational efficiency, has not attended the schools of the Church Education Society. They are, so far as I have seen, feeble and inefficient. Indeed it would be impossible to expect any other results from a position of such narrow isolation as they occupy. None of the stream of energy and life which large bodies of men acting in concert together produce seems to reach them. There are no connecting links along which it can flow to them, and so they live a half life, doing their best indeed, but never reaching in height or development to the standard of even a respectable mediocrity. They are exposed to none of the tests which, if they are sometimes severe, excite, notwithstanding, a more vigorous action, and, in the end, do good.

87. They form the parochial machinery of the Established Church, and are planted wherever there is any Protestant population at all. In the towns they universally exist. I visited no town without such a school or schools.

* Only five departments are included in this calculation, one of them being closed I was unable to get information personally.

† This school was only just opened, and the average attendance is estimated consequently, but the amount of grant is determined.

‡ These returns are taken from the references in report of the National Board for 1867—*vide* p. 4467.

In Cork they are numerous, there being six separate schools, as distinguished from departments, attended by 393 children in that city. In Bandon there are six, attended daily by 238 children. Of that number, however, one must be counted as belonging to the Erasmus Smith charity, and another to the Irish Society, but as they are inspected by the Church Education Society and adopt its system, I have included them among their schools. At Kinsale there are three schools attended by 66 children, 44 of whom are infants. In Skibbereen there are two attended by 150 children and 20 infants. In the rural districts, the same care has been taken to supply the Protestants with school accommodation. However small the number in a place, there a school is established and maintained. Many of these places indeed are apologies for schools, but, anyhow, they go by the name, and are counted as such. At Kinsale I found present in the girls' school not more than 8; and in the school census cases frequently occur of schools with less than ten children in attendance. In the Bandon Constabulary district there are 20 schools of this society, and 9 of them were attended by less than 20 children on 25th June, 1868, the average for the 20 schools not being more than 10·5 children each. Now although it is satisfactory to see such a diffusion of the means of education, it still must be owned that its results cannot be of the most vigorous growth. It is gratifying to feel that, for conscience' sake, the clergy and people generally struggle to extend and maintain the blessings of education under such disadvantages, the greatness of which extenuates the faults and defects which are so common in their schools.

88. Some few of these schools are really efficient, but they are very few indeed, and it will always be found that the exceptions in excellence are always the exceptions in numbers. The larger schools are always the best. The schools at Bandon are examples of this. The girls' school attached to the female training institution there, is, taking everything into consideration, very well conducted, and the boys' school is certainly the best I have seen of the Church Education Society's schools. Strangely enough, in Cork, where the children should be quicker, owing to their town life, the schools are very inferior, those, at least, which I examined. The small country schools are dull beyond description. There is an aimlessness and sluggishness about them which is distressing to see. I do not see how it can be otherwise. There is not sufficient resistance in a few children to call forth a teacher's powers of organization, or discipline, or skill. The individuals are so immediately within reach that there is no call for system. And besides all that, the teachers are very young for the most part, have been brought up in the same schools, and have inherited their spirit, which a residence of a few months at the Bandon training schools is apparently unable to supplant with a better. Much care is bestowed on these schools by the residents in their neighbourhoods. In the towns committees are formed, and ladies are diligent to promote through their action the good of education. The clergy, too, do what they can for them. There are many mixed schools, but they are not in great favour, and whenever it is possible separate departments are established. The Church Education Society has seen the wisdom and necessity of training infants, and are careful to have infants' schools, which, if they were large enough, would be, there is no doubt, good stepping-stones to the upper departments. Many of them are to be found. I visited four, and found one fairly efficient, but of the others not much can be said. The ages of the children are high, and, like the general run of Irish school children, do not carry with them a corresponding amount of proficiency.

89. Of the moral tone of these schools it is difficult to judge. The children are certainly cleaner and more respectable looking than the general run of the scholars in the National schools, and their manners, though not so pleasant and friendly, are certainly less untamed. But then they are very frequently of a better class in the towns, and in the country are helped if they are regular at school. Much attention is paid to their religious knowledge, which is based upon Scripture immediately, with which the children are early made acquainted; they learn passages by heart as one of the subjects in which a successful examination must be passed in order to advance into the higher classes. They daily read it in the schools, whose discipline and morality are enforced by reference to the Sacred Text, although in one school it seemed to be not unnecessary to use the stinging arguments of the cane equally with its gentler admonitions. Copying and prompting were as prevalent in them as in any other schools.

90. Inspection does not seem to do them much good; indeed, since nothing is made to turn upon it, I cannot see how it can. Besides, the style of inspection is, from what I could gather from the Inspector's reports, either so superficial, or its unveilings of weakness so partial, as to counteract their effect, and so go for nothing. Plain speaking is absolutely necessary if inspection is to be worth anything, but it is, perhaps, not always thought expedient. I read in the "report books" of the schools of this society complimentary remarks on schools which I found to be deserving of very slender commendation. Those who are interested in them, and who now desire to see a denominational system established, will, I suppose, claim for each of these schools equal grants with larger establishments; it will become, therefore, an important economical question whether the present system of aiding schools shall be maintained. For if the teacher, and not the extent of work and its results, be the basis on which schools are to be supported, the addition of many thousand schools to the rolls of the National Board will involve an expenditure out of all proportion with the object to be effected.

Workhouse schools.

91. I visited only one workhouse school; it was at Midleton. The summer is not the season when the workhouses are fullest, and so there were few children comparatively in the Midleton Union. There were two separate departments on the ground floor of the building, in which there were 36 boys and 46 girls on the rolls, respectively, of whom 30 boys and 40 girls were present at my visit, the others being engaged in duties about the house. The average attendance was of boys 29, in whole numbers, and of girls 38. The average age on coming to school was for boys 9·4, and for girls 6·8, the former leaving, on the average, at 10·4, and the latter at 9·8. The girls, it would seem, therefore, receive three years' instruction, on the average, and the boys only one year.

92. Many of the girls whom I saw were orphans, and having no home, live in the workhouse. Several bore the marks of early ill-usage; and their disfigured and careworn countenance and (sometimes) deformed bodies made it painful to see them. They were well-behaved and well taught, and more intelligent than most of the children I examined, that is, their minds were more opened and better trained. Their explanations of their reading lessons in intelligible language, and their knowledge of the meanings of the words were creditable. In arithmetic they were equally proficient, the second class being specially good. Their sums were done with rapidity and accuracy, and very neatly, as was also their dictation. The children in the First Book were better taught than any I had met with, except, indeed, the children at the Kinsale convent, but their advanced ages, as indeed of the whole school, must not be lost sight of in estimating the condition of their instruction.

93. The mistress had been a monitress in a convent school, her grade being the first division of the second class, but she had not been trained. Her salary amounted to £20 in money with board and lodging. The master was in the highest division of the third class, was not trained, and had been teaching since 1860. He received £25 in money, with board and lodging estimated at £45. Both of them held their places under the Board of Guardians, who have the power of suspension, but not of dismissal without just cause. They would be entitled to pensions amounting to two-thirds of £20 in the event of old age or infirmity. No good service money was allowed. The school-rooms were, as such, very good, but the furniture was not very appropriate to a school. The books in use were those of the National Board.

Irish Society

94. There was only one school of the Irish Society in my district. It was the Ragged School in Bandon, connected with the Church Education Society, and occupying a pleasant building of ample dimensions, on the upper floor of which the elder children were taught, and on the lower the infants. There were present 19 boys and 32 girls, but on the rolls there were 35 boys and 42 girls, the average attendance being 46. The arrangement of the desks in parallel groups made the classification of the children complete. The walls were hung with maps and cards, and round the cornice ran a green scroll with the legend, "Search the Scriptures." The children looked remarkably neat and clean, although I went without giving any notice. There were no Catholics, so far as I could make out, but the registers of the Church Education Society contain no spaces in which to record the denominations of the children. I examined the third class in reading, but the results were very poor. Hesitation, mutilation of the words, and no intelligence, characterized it. A very kindly master, who had been there since 1853, conducted it, and was assisted by his daughter, who looks after the infants in the room below, and by a mistress, who teaches sewing, for which she is paid £12 a year. The master's emoluments are £41 a year, with a good house. The children are very regular, owing to the inducement which a payment of 1*d.* to those who are present during the week creates. They do not receive the money, but at the end of the year it is summed up, and its value given in clothes. The infants' room is damp, the floor being of brick. The Irish Society supports the school, but it is conducted on the Church Education Society's system. I may add that a few Methodists constituted the only foreign element as regards religion.

The Island Society.

95. The Island Society has a school in Shirkin Island, the only one in my district. It is hardly worthy of mention. There are, I believe, four scholars, some of them connected with the master, who is a small farmer, and receives, I was told, £10 a year. All the signs of a school that I saw were two maps, and one or two alphabetical cards; I saw no scholars. The room was a dark dingy place, with an uneven mud floor, in which the education of the children is conducted. The priest informed me that it was simply a trap for proselytes, baited in secret by the devotees who try to conceal their real object under the pretence of having a school. Unfortunately, he said, there were three little Catholics attending it, who, through some quarrel between their relatives, had been sent there.

Hedge schools.

96. Under the name of "hedge" school is comprised all the miserable little private schools which still hang about the towns, and sometimes the villages, and will continue to exist so long as the older people live. There is something respectable in the old type of "hedge" school, which really was occasionally dignified by the superior learning of the teacher, but the modern "hedge" school is an abomination. I visited five of these places, four in the town and one in the country. I cannot do better than take the school conducted by Mr. A—— H—— in Cork, to which I paid a visit, as typical of all. I drove up a street inhabited by the poor, and soon found Mr. H——'s academy, over which hung a board painted with his name. I knocked, and was civilly, if not cordially, received by the master, a deformed but very intelligent looking man. He led me up the stairs which were lined with children, ascending and descending, into a front room, in which, sitting, standing, and squatting, were forty-four children of both sexes packed together in an unhealthy, foul atmosphere, and engaged some in reading, some in writing, others in summing, and the majority doing nothing. From that I passed into a back room, apparently a bed-room, about eight feet square, in which I found about twenty-six little children so closely crowded as to render it difficult to get about amongst them. Both rooms could not contain more than twenty-four children at eight square feet each, but were made to accommodate seventy. I endeavoured to examine them, but the stifling, filthy odour was overpowering, and I left. There was a little trap door in the floor of the attic, into which some of the scholars went by means of a ladder. Of course there was no classification, and the teacher takes each child individually, which constitutes the great charm of these schools in the eyes of the people. The charge is 4*d.* a week for the most proficient, and 2*d.* and 1*d.* a week. The man informed me that he realized about 16*s.* a week by his day school, but had an evening school besides. He was unusually crowded in consequence of the vacation in the convent school adjoining, and I saw many children who were attendants there. Parents think that individual teaching is better than teaching in classes, and so send their children to these horrible places. Some think that the society is more select, and so send them, especially the girls, to private schools. I visited two others in Bandon of exactly the same character as the one I have been describing. In both cases the teachers had been connected with the National Board. It would be well for health and morality if such places were more actively discouraged. I was told by an Inspector that a parish priest encouraged them on the ground that competition would make the National teachers work harder.

Infant schools.

97. It is strange how little provision is made in the ordinary National schools for the proper instruction of infants. I came across only 6 separate infants' schools in connexion with the National Board, 4 of which were in Cork, 1 in Cloyne, and 1 in Skibbereen; and found on their books an aggregate of 812 children, of whom, however, not more than 456 were in daily average attendance, being not very much more than half of the number on the rolls, which may be accounted for by the small attendance, especially of young children, at school in the winter months, parents not wishing to expose them to the severity of the weather without shoes and with little clothing.

98. The ages of the children in these schools are higher than with us in England, and the presence, invariably, of a number of children of eight and nine years of age destroys very much their distinctive character as infant schools. I did not see in any of them a gallery class the average age of which was below five, and the more advanced children were over six. This is owing, perhaps, to a disinclination among the people to send very little children to school, and to the small extent to which the value of infant training is understood. Perhaps, a good deal of this disinclination is owing to the neglected condition of the younger children who attend the ordinary National schools, which never contain infants' departments. Then the schools themselves are very unattractive. The teachers either know little about infant school management, or if they do, the arrangements in the school-rooms are unsuitable, for skill must be seconded by such arrangements as will allow the carrying out of a good system. In Cork the SS. Peter and Paul Infants' school is conducted by a very intelligent mistress, who, although she has never been trained, has, by observation and study, as well as by her love of teaching, succeeded in learning something about the proper method of teaching infants; but her school is not roomy enough, and there is no gallery for the little children, who are perched upon benches, up and down which they are helped.

99. On the other hand, in the St. Patrick's Infants' school there are all the necessary arrangements, including space, for having a good school, but the mistress knew nothing about her business, and all those advantages went for nothing. From these two causes result the inefficiency which I noticed in all the infants' schools of which I have spoken. In two of them disorder was the order in the school. There seemed to be no command over the children. The scene in St. Patrick's school which I witnessed on entering was extraordinary. Near the door was seated the mistress with a class in reading around her, while 150 little children were scrambling up the gallery, swarming like ants, and screaming or crying as their humours swayed them. How the mistress got on with her lesson I cannot imagine. An endeavour, at my request, was made to obtain quiet, but the success was very transitory; in a few minutes chaos reigned again.

100. Much the same sort of scene was enacted at the Skibbereen school, which was very unsuitably furnished. I must make an exception in favour of the SS. Peter and Paul's school, in which, despite the accommodation, good order was preserved, the children kept in their places, were obedient, and were as neat and clean as any of the children attending the convent schools. They were also very well taught; but far too many children above seven were present. The mistress tries to get up a spirit of emulation among the children which, she says, succeeds. A little girl, for instance, is asked a question which, if she answers it well, is applauded by all the others, but if she fails entirely, she is sent into a back bench until she redeems her character, when she is restored.

101. The instruction of these schools, as the teachers generally seem to know very little about infant management, is of course deficient. The children can follow if they are led, but can do nothing by themselves. They cannot count without help, nor add unless in the form of repeating the addition table. None of the advanced children can copy letters, and the idea of expecting children reading the First Book to write letters from dictation is regarded as the theoretical fancy of some impractical being. Physical exercises, which lighten the labour of learning to the infant, do not seem to be understood or practised at all. But as these results are attained elsewhere, why should they not also be attained in Ireland? What is wanting is a supply of good teachers who should be made to work up to a certain standard, and their schools tested yearly to discover whether the standard is attained.

102. In the towns the demand for infants' schools is very fairly met by the nuns, who always have infants' departments, in which, although there may not be the same amount of elementary knowledge imparted as with us in England, there is always good order, neatness, cleanliness, and some systematic teaching. The children are taught to move together by signs, they go through a drill of physical exercises, accompanied with singing, with great precision and regularity, while they learn something in the way of counting and adding, the multiplication table, a knowledge of the letters of the alphabet, and, in one case, I heard a gallery class answer questions simultaneously on the geographical definitions very fairly. It is in these departments that the Irish nuns do best. It requires patience, much self-control, and perseverance, to discharge the duties of an infant school teacher successfully. The discipline of the "religious" life, and the motives which inspired them to embrace it, will explain their success in these schools. Whether connected or not with the Board, the nuns' infants' schools are creditable as compared with any others. One of the best managed—I do not say taught—infant schools I ever saw was the one attached to the convent of the Irish Sisters of Charity in Cork. It is the only infant school I saw in which a limit of age is observed, and so it is really what it professes to be. There were 269 children of both sexes present in a large room with plenty of space for the movements of the children. The average age of the school was not more than 4·5; and at 6 years of age the boys are sent to the Christian Brothers, and the girls to the higher departments of the same school. The drill of the children was admirable, and their instruction fairly good. The spirit was cheerful, pleasant, and vigorous. The infant departments of the Sisters of Mercy schools are not in any respect equal to the other convents; but they are superior to any of the ordinary National infant schools.

103. The Church Education Society must be commended for its carefulness to have infants' departments in their schools whenever it is possible. Of seven schools there were five which had separate departments for infants, in which were present, on June 25th, 1868, including the infants from two schools without such provision, 170 children. Judging of these departments from two which I saw, they seem to be conducted systematically and very fairly. They want, however, numbers to give them life.

Number of infants attending school in Cork.

104. The following figures will give an idea of the number of infants attending school in Cork. According to the school census there were present in all classes of schools, 1,842 infants; the number of infants, who ought to be at school being 3,040, between the ages of four and six, and between three and six, 4,549; the per-centage, according to the former estimate, being 60·5 per cent. at school, and according to the latter only 41·1 per cent. The first estimate supposes that a child does not go to school until the age of four is attained, and gives as the average attendance of infants the same per-centage which, I believe, represents the proportion of children of all ages present daily throughout the year at all. But as every infant is able to go to school at three years of age, the latter estimate is the truer one; and 41·1 per cent. only of infants at school is more in keeping with the appearance of the streets in Cork daily, which are filled, in the poorer parts of the city, with little children.

105. Looking at the supply of schools, and their situations in the poorest localities, there are no defects in these respects which can explain the absence of so many infants from school, and the school accommodation in Cork is much in excess of the actual needs of the population. It is, I believe, very much owing, as I have said, to the want of a full perception of the value of infant training which seems to exist generally. The people too, are very indulgent to their children, and it seems hard-hearted to them to send them to school so young. But I have no doubt that the increase which has of late years taken place in the convent schools will break down the prejudice, and parents will find that the school is a better place in every way for their little ones than the streets.

106. In the National schools, which have no separate departments, but which take in infants, some special regulations seem to be necessary to ensure proper attention being paid to the younger children who attend them, and especially in rural districts. A gallery should always be insisted upon, and a certain amount of instruction for the children under six required, with something higher for those of them who are rather more advanced than the mere babies. It would not be requiring impossibilities, and would be laying good foundations, if the children were expected to come up to the English standard, viz., to count to 100 without assistance, to point out the letters of the alphabet, both small and capital with facility, and in the case of those a little more advanced to be able to copy letters from a black board or slates. By this means time would be gained, and the children would at six years old be better prepared for the next step in their education, and progress would be more rapid and more easy. But it will not be sufficient to create a standard, there must be some test applied to ascertain that it has been reached, since unless that is done, the standard will never be reached.

Evening schools.

107. The period of my visit was unfavourable for seeing evening schools, of which, however, there were not more than three in Cork, one only of them being in operation when I was there. These three schools were established by the zeal and benevolence of private individuals. One of them, in the north side of Cork (the one I visited), was first of all started by a pious working man, Mr. Trevor, who feeling himself, he said, the disadvantages of the want of proper instruction, was resolved to do what he could to afford the means of instruction to those who were too old to go to day schools. He therefore betook himself to Mr. Hegarty, whose assistance was at once afforded him, and to Professor England, of the Queen's College, who likewise gave him countenance and personal aid. Thus strengthened, he began by obtaining leave to use the girls' school (St. Mary of the Rock) in Blarney-lane, engaged a paid teacher, one of the assistants at the Sundayswell Female National School, and commenced operations. He himself taught occasionally, and was aided by other charitable individuals. The school was intended for girls, and on the evening of my visit there were 46 present out of 120 on the rolls, the average attendance for the three months it had been opened being 52. The ages of the girls ranged

from twenty to twelve; they were principally hands employed in the flax mills. The majority of them had left school very early, and were very ignorant; some of that number were able to do no more than write copies in text-hand with difficulty, and the best were reading no more advanced book than the Third Book of the National Board series. The modicum of arithmetic was very small. No one, I was informed, was able to do the compound rules, while the majority knew nothing of figures at all. The school at the time I saw it was not fully organized, which, unfortunately, it had not time to become, as before I left Cork it was discontinued, at least it had no longer the privilege of using the same premises, and had not, so far as I could gather, re-assembled elsewhere.

108. On the opposite side of the river, a male evening school was established not long before the one I have been describing by the same excellent people, aided by a priest; it was closed when I was in Cork, and I could not, therefore, visit it, and was not provided with the statistics respecting it which I had been promised; I can, therefore, say but little about it beyond the fact that it was composed of young men and boys whose religious education was so neglected, that the first work to be done was to teach them their catechism and the moral principles of Christianity. Secular instruction had not been regularly commenced, for which reason they had not yet applied for State aid. Another evening school for boys is held during the winter in the Blackpool National School, and is patronized by the Society of St. Vincent of Paul. But as it was not in operation, and no registers were kept, I could gather nothing more about it. It appeared that the teachers of the private schools have evening classes, from which they derive part of their support. The scholars in them go to learn what they can of arithmetic, accounts, and letter-writing; but they are not of the class who compose the normal type of evening scholars.

109. Looking to the proportion of children in the lower classes of the National schools, and the small amount of instruction which that classification implies, and the advanced ages of the children composing them, which fact, in its turn, suggests how many children leave school imperfectly educated, the establishment of evening schools in a town like Cork would be most beneficial. The young are without employment after six o'clock, and if they could be induced to spend two hours during the winter months, say from seven to nine, in an evening school, they would be in the way of improvement, and out of the way of the numerous temptations of the lowest kind which beset the young in a large town. If the clergy would lend a hand, and take the matter up earnestly, it might, I think, be effected. It would, in its way, do as much good at least as pulpit admonitions, and would not probably be of less penetrating influence than the solemnity of a bishop's pastoral.

Mixed Schools.

Mixed schools.

110. The number of mixed schools of all descriptions visited was 15, or nearly 17 per cent. of the whole number. They were distributed as follows:—8 were National schools, 5 of these being under Roman Catholic management, 2 under the Established Church, and one Presbyterian, and 7 were in connexion with the Church Education Society.

111. The private schools I exclude, although they would, from the fact of their containing children of both sexes, come under this head. Six of the National schools were conducted by masters, and two by mistresses; and of the Church Education schools, five were under masters, and two under mistresses. The National schools were the largest, the Roman Catholic schools being all in more or less populous situations, and standing, if it can be said of any Catholic school in Ireland, in the light of parochial schools. The Kilmacabea school is in the large village of Leap; the Cove of Kinsale school is situated in the fairly populous village joining on to Kinsale; the Belgooley school is in the village of that name, as also the Clogheen school; the Ballintemple school is in the town of Ballintemple, near Cork, and is the school of the Established Church district of that name; and similarly, the Blarney school is the school of the parish of Garrycloyne. The Presbyterian school is in Cork, and is the only mixed National school in that city. The Church Education Society's schools are, with exceptions, also parochial. The Irish Industrial Ragged school in Cork and the Irish Society's Ragged school in Bandon form the exceptions.

112. The Roman Catholic schools are held in the worst buildings I saw. A description of them may be read further on under the head of school buildings. The structures, besides being bad, are so wanting in space that overcrowding ensues, which is just the very thing that ought to be guarded against in mixed schools; and worse than all, these schools are not supplied with offices of any kind. The Church Education Society's schools are also held in inferior buildings, though many degrees better than the others, and are mostly without offices.

113. On the rolls of the National mixed schools I found the names of 252 boys and 231 girls, in all 583, 349·6 of that number being in daily average attendance. In the schools belonging to the Church Education Society there are 160 girls, and 116 boys on the rolls, making in all 276, of whom 185 were in daily attendance. Counting the two classes of schools together there were 859 children on rolls, with an average of 534, or a fraction more than 62 per cent.

114. Mixed schools are not in great favour anywhere, the feeling being much against mixing boys and girls together, and they only exist when nothing better can be done, or where there is not much activity among the clergy. In the very poor places inability to raise enough to build separate departments entails the necessity of a mixed school, which it is preferred to put under the care of a mistress, popular feeling being very averse to having masters over them, but whatever feeling may be, facts show that they are more frequently taught by masters than by mistresses. In the National schools there is always a mistress who superintends the girls and teaches them needlework. In three cases the mistress was the master's wife. Mixed schools may be productive of good, and are, if they are under the care of teachers who have some power of influencing their scholars by moral means; but I should be afraid of them without some such guarantee. A mistress who is well trained is particularly valuable in such schools, as she is able to subdue and soften the boys better than a master, which is, of course, the great thing to be done in order to make their association with the girls less objectionable. In Ireland, officered as they now are, I should doubt much whether they are likely to do much good. As regards instruction, the mixed schools appear to be among the most deficient, as they are, indeed, in every respect.

Attendance.

Number of children at school in proportion to population.

115. In determining the proportion of the population of the country who are at school, we may take either the number on the rolls, or the average daily attendance, and compare either with the whole population, and thus arrive at the proportion of children at school to the population, or with the number who ought to be at school, and thus arrive at some definite conclusions respecting the number of children who actually do go to school.

116. For the former process to be at all satisfactory, it would be necessary to obtain carefully the number of children on the books of every school in each district, and to assure one's self that such records were correct;

but as I was quite unable to go to every school in each district, and, moreover, as only in the National schools could any real information be obtained respecting the numbers on the rolls, owing either to no books being kept, or to their imperfect condition, or to a misleading system of registration, I determined to ascertain the numbers actually present on a certain day in all the schools in the towns and parishes which I visited, and compare the number thus obtained with the numbers who ought to be at school, taking as my standard the generally accepted proportion of one in every six of the population as representing more or less accurately that number.

117. The period at which the school census was taken was the most favourable that could have been chosen, as the attendance at that period about represents the proportion of children calculated to be in average daily attendance during the year, and the following table will show the school attendance in seven districts together with their population on June 25th, 1868 :—

Districts.	Population.	Number of children who should be at school.	Number of children actually present on 25th June, 1868.	Proportion present.	
				To population.	To numbers who should be at School.
Cork (City),	80,121	13,353	8,658	1 in 9	64·7
Passage West,	2,288	381	291	1 „ 8	73·4
Queenstown,	8,717	1,452	1,188	1 „ 7	81·1
Bandon,	6,243	1,040	835	1 „ 7	80·2
Kinsale,	3,714	619	738	1 „ 5	119·
Skibbereen, Town and Country,	10,397	1,729	1,182	1 „ 8	68·3
Midleton, including Cloyne and Castlemartyr,	11,475	1,912	1,387	1 „ 8	72·5
Totals,	122,955	20,486	14,279	1 „ 8	69·7

118. Of those seven localities, in five cases the population of the towns alone is dealt with, and in two only, rural districts are included, viz., Skibbereen and Midleton. By rural districts is not meant all the parishes which are comprised in the Constabulary lists, but only the parishes which were actually visited. Thus Skibbereen, besides the town itself, includes Abbeystrowry, Tullagh, and Creagh; and Midleton, besides the town, includes the rural districts of the parish of Midleton, Mogeesha, and Cloyne, as well as Mogeely, which, although properly belonging to the Youghal Constabulary list, I have for convenience placed with Midleton.

119. Out of a population of 122,955, it appears from the above table that on 25th June, 1868, 14,279 children were in attendance at school, or 1 in 8, the number which ought to have been there, taking 1 in 6 as the rule, being 20,486; and the number absent being 6,207. The absence of that large proportion of children from school I account for by the small number of infants, *i.e.*, children between three and six, in attendance at school. I have alluded to this matter under the head of infants' schools. It would appear that about one-third of the children who ought to be at school are infants of that age, of whom somewhat more than one-third seem to go to school. In Cork there are 13,353 children of a school-going age, of whom 4,549 are infants between the ages of three and six, or rather more than one-third of the former number. On 25th June, 1868, not more than 1,842 infants were present in the schools in Cork, or rather more than one-third, speaking roughly.

120. The same proportions appear everywhere, and may be taken presumably as the rule, and applicable in explaining the absence of those 6,207 children from school. That number is, like the case in Cork, more than one-third of the total of children who should be at school, and may therefore be considered as infants who were kept at home either through the dislike of their parents to send them to school so young at all, or owing to the distances in the country districts being too great for such young children to travel. But supposing one-third of the 6,207 infants to have been at school, which is very likely, that would imply the absence of 2,069 of the older scholars, caused by the same circumstances which keep even tolerably regular attendants from school.

121. The proportion of children at school to the population is lowest in Cork and highest in Kinsale, while in all the other districts it is nearly equal. The facts regarding Kinsale must not be considered as representing the real state of affairs there, as the population of the town and the rural part of the parish is taken, while the large convent school there is attended by the girls of the surrounding rural parishes, the populations of which are not included.

122. The number of infants in Cork not attending school at all explains to a very considerable extent the small proportion of children at school in that city. But, besides, there is this fact to be recollected, the necessary existence in large towns which have no large industries in operation of a considerable number of very poor people, whose poverty degrades them, and renders them insensible or careless about the interests of their children, who are, consequently, either left to run wild, or are employed in getting what they can for their parents. It would seem that 2,000 children not infants are daily absent from school. In the smaller towns there is not so much poverty, or, at least, it does not exist in such an aggravated form as in Cork. It is more within reach of the influences which, if they cannot check, at least modify it, and prevent it from lapsing into entire degradation. Queenstown and Bandon, each of them large country towns, make a respectable appearance as regards the number of their populations at school. In an estimate which includes all classes of schools—primary, middle, and upper—it is difficult to determine exactly the state of affairs among the actually poorer classes. There is, first, an absence of any means of discovering the proportion between the rich and the poor of the population, and consequently of determining their relative number in the schools. The number of children of the better classes at school would be, proportionately to the population, greater than the children of the lower classes, who, therefore, in a general estimate make a more respectable appearance than they would if the different classes of society were taken apart.

Proportion of different religious denominations at school.

123. As the members of the different religious denominations attend schools more or less directly connected with their churches, it may be instructive to glance at them separately. There are 67,148 Roman Catholics in Cork, 11,191 of whom ought to be at school; but on the 25th of June, 1868, not more than 6,705 were present, or not more than 1 in 10 of the population, and only 60·4 per cent. of those who should be at school. The members of the Established Church number 10,632, of whom 1,772 should be at school, but only 1,146 were present on the occasion of the school census last year, making a proportion of 1 in 8 of the members of that Church, and giving a per-centage of 64·6 of the numbers who ought to be at school. The differ-

ence of attendance at school between Catholics and Protestants in Cork does not, therefore, appear as great as might have been expected; but it must not be forgotten how many of the members of the Established Church educate their children in England, so that these figures can hardly be taken to represent the state of things among the Protestants who make use of primary schools. The Presbyterians and members of different dissenting bodies number together 2,350, of whom, supposing 391 to be the number who ought to be at school, there were present in different schools in Cork 201, or about 1 in every 11 of the population, and 51·5 per cent. of 391, the number who ought to be at school. But as the members of all these bodies are without exception almost of the upper classes, we may fully account for these low figures in the same manner in which the low per-centage of members of the Established Church was accounted for.

124. In Bandon there is a Roman Catholic population of 4,315, of which 719 should be at school. In June, 1868, there were 535 children present, giving a proportion as regards population of 1 in 8, and a per-centage of 74·4 of actual attendants. In the same town the members of the Established Church number 1,541 souls, of whom 256 should be at school, while the number actually present was 274, or 1 in 5 of the population, and more than 100 per cent. of the number who ought to be at school. This is remarkable, but it is, I think, easily accounted for by the presence of so many scholars above sixteen in the schools, in several of which young men are prepared for the Civil Service. Of Presbyterians, Methodists, and other persuasions there is an aggregate population of 387, and 64 should be at school, but not more than 49 were present when the school census was taken, being 1 in 7 as regards population, and a per-centage of 73·4 as regards attendance. These instances serve to illustrate the towns, I will conclude them by reviewing three country parishes.

Attendance in the country.

125. Kilmacabea is a parish in the west of Cork, and contains a population of 3,149, of whom 2,903 are Catholics, and 245 members of the Established Church. Of the former denomination 482 ought to be at school, and of the latter 40. When the schools of the parish were visited and the census taken, only 232 Roman Catholics were present, and 33 members of the Established Church. So that while in the case of the latter body 1 in 7 of the population and 82·5 per cent. of 40 were at school, in the case of the Catholics only 1 in 12 was attending school, being a per-centage of only 48·1 per cent. of the number who ought to have been there. Myross, another rural parish, numbers a population of 1,493 souls, the number of Catholics being 1,325, and of the Established Church 159, besides 9 Methodists. Of the former 220 should be at school, and of the latter, including the Methodists, 28. In the National school 196 Catholics were present, and in the parochial school 18, the proportions being as regards Catholics 1 in 6 of population, and 89·8 per cent. of its school going part, and, as regards the Established Church, 1 in 8 of the population, and 64·2 per cent. of school goers. Again, in Tullagh, one of the wildest districts in that part of the country, there is a population, including the little town of Baltimore, of 1,868 Roman Catholics and 151 Protestants; of the former 331 are of a school going age, and of the latter 25. The schools attended by Catholics contained 233 at my visit, and the Protestants numbered 17, giving a proportion 1 in 8 in population, and a per-centage of 70·3 present of the number old enough to go to school for Catholics, and for Protestants nearly 1 in 9 of population, and a per-centage of 68 per cent. of actual attendants.

State of attendance in Bandon and Skibbereen districts.

126. I have taken the trouble to calculate from the census the populations of the Bandon and Skibbereen constabulary districts, with the view of comparing together the whole population of each district with the number of children who were present in school when the census of schools was taken last year for the Royal Commission. The results, although in some respects the two districts are very different, are curiously similar. In the Bandon district, there is a population of 19,917 Catholics, 3,502 members of the Established Church, and 508 Presbyterians and Dissenters of different kinds. On 25th June, 1868, there were present of Catholics 2,200, or 1 in 9 of the population, of members of the Established Church 537, or 1 in 6, and of Presbyterians 58, or 1 in 8. The latter proportion must not be taken to represent the real state of education among the Presbyterians, as being scattered over the country, they are included in other schools or are educated out of Ireland. The population of the Skibbereen constabulary district is divided between 23,799 Roman Catholics, 708 members of the Established Church, and 175 Presbyterians and Methodists. On the day above named, 2,521 of the first mentioned class were in school, 708 members of the Established Church, and 15 Presbyterians, so that 1 only in every 9 Catholics, and 1 in every 7 Protestants was in attendance at school.

Protestants attend school better than Catholics. Reasons.

127. These facts, together with others, lead to the conclusion safely that in the whole of the Cork district Roman Catholic children do not attend school as numerously as the Protestants, the latter body coming very nearly up to the mark, while the former fall below it considerably. The fact that the Protestants are generally a superior class of people to the Catholics must not be forgotten in trying to arrive at an explanation of this difference; nor their smaller numbers which, of course, brings them more easily within the reach of the higher influences which the Protestant landlords and middle classes exercise in the country. The Roman Catholics are more numerous, and were for centuries in a helpless state, during the whole of which time the Protestant community was enjoying whatever blessings and advantages a growing civilization could bring. Efforts in behalf of education existed many generations in Ireland previous to the creation of the National Board, but it affected only the members of the dominant party, and so far as the Catholics were concerned might never have existed. It is not more than thirty-five years since the National scheme made education general, and the Roman Catholics, as a body, cannot boast of an educational tradition older than that. It is not wonderful, therefore, that they are not as alive to the advantages of instruction as their Protestant neighbours, considering, too, the economical, physical, and other difficulties which stand in the way of education.

School accommodation.

128. The question next arises as to whether the school accommodation is sufficient to meet the educational needs of the people. I should be glad to be able to give full particulars with respect to this question in each district which I have been discussing, but as all my information on this head relates only to the schools I visited—not amounting to one-third of the total number of schools on the constabulary lists—I can do no more than give such facts as may be taken to represent the general condition of affairs. The question of the sufficiency of school accommodation has of course two significations—it may either relate to the sufficiency of separate buildings to meet the convenience of localities, or it may mean the sufficiency of space in the existing buildings in relation to the wants of the population.

Supply of school-houses sufficient.

129. Now in both these aspects I do not think there is anything to complain of. As far as my experience went I came upon no district which was not supplied with a school more or less conveniently situated, nor were there any complaints on this head, except in one or two instances—there certainly was no generally expressed feeling of want among the clergy, and the reports of the constabulary are satisfactory. Speaking roughly, there are school-houses at distances of from three and a half to four miles from each other. This I noticed on my journeys. And the utmost distance I ever heard of a child having to walk to school was five miles, and then it was done voluntarily to attend the Christian Brothers' schools, or the nuns' schools. There was no necessity for it. The parish priests who, in the first instance, found the schools, take care to establish

them in such positions as are central for the districts the needs of which are to be supplied. Only one priest in charge of a parish complained of the want of schools. Mr. Rice, of Queenstown, says, "we want a school at the west end of this island, and a suitable school at the east end."

130. This, as may be seen from the letters contained in the Appendix, is the only distinctly expressed want. Others complain of distance, but if schools were to be founded merely to meet the inconvenience of distance, which after all affects very few, there would be an end to all economy. In a widely-scattered population there must be inconveniences of this kind. The sub-inspector of constabulary in the Skibbereen district reports the want of a school "at Bade, in the parish of Myross." In the Passage West district "there is no primary school in operation in the district of Victoria, containing about 4,550 acres." In the Mitchelstown district "there is a very considerable tract of country at Grayden in which no primary schools are in operation, and much inconvenience is felt in consequence of that want." One very good evidence of the supply being equal to the demand is that no new schools are being established. There are new buildings here and there in the course of erection (there should be many more in that condition), but only as substitutes for unsuitable ones. Emigration has so much drained the country that the schools which were established when the population was greater are now found to be sufficient for its present extent. All the provincial towns of the south of Ireland have diminished in size, and Cork, its chief city, has made no advance in numbers. This brings me to consider the actual accommodation in the schools I visited, and its relation to the needs of their localities.

Accommodation in schools abundant.

131. In calculating this, I took as my basis the requirement of 80 cubic feet of space for each child in average attendance, which the Committee of Council on Education expects in every school to which annual grants are made. The capacity of buildings estimated in that way is much higher than if area only is calculated, and when the buildings are lofty, as is frequently the case, the gain in height quite obscures any deficiency of area in a calculation. I have, however, calculated by the rule of the Revised Code, and find that in 86 schools which I visited, with 17,819 children on the rolls, 10,264 present at visit, and an annual average attendance of 10,704·3, there were contained 1,926,975 cubic feet of space, which shows them to be capable, at an allowance of 80 cubic feet of space to each child, of accommodating 24,087 children, or 13,383 children more than are in daily average attendance. This excess, startling as it is at first, will not seem so great if it is recollected,—first, that cubic capacity, and not area, has been calculated, and that, therefore, the real capacity of the buildings is exaggerated; second, that class-rooms are included; and third, that several very large school buildings not a quarter filled, and connected with the Church Education Society, are likewise included, and swell the number considerably. In Cork alone, three of these schools, with only 142 children on the rolls and an average attendance of 111, could together accommodate 1,267, or more than half of the Protestant children who ought to be at school. At Bandon, again, there was accommodation for 949 children in schools which were attended on the average by no more than 203. The school attached to the Female Training Institution has room enough for 365 children, although it is attended by an average of only 43, and the practising school for boys could accommodate 332, but has no more than 68 in daily attendance. But, making due allowance for the effect which the inclusion of these schools has upon the results of the calculation, and even taking area as the basis of calculation, a great excess would still remain.

Accommodation in ordinary National schools:

132. In the ordinary National schools there is a great excess of space. Wherever I went I found it so, except in the case of a few non-vested schools. Thus in Cork the ordinary National schools are capable of accommodating 3,257 scholars, of whom, however, there were not more than 1,397 in daily average attendance. In Queenstown the National schools have space enough for 1,391 children, but have an average attendance of only 365. In Bandon, where the accommodation is poorer than in any other town, the two National schools, with an average attendance of only 143, could hold 317. In Skibbereen the schools could accommodate 1,190 children, but are attended by 437. I might continue this over the whole of the district.

in convent schools:

133. The convent schools, whether in connexion with the National Board or not, have likewise superabundant space. In Cork, they are attended, on the average, by 4,869 children, but could accommodate 9,913. Class-rooms are included in this estimate. With one exception, the rooms in these schools are very lofty, and so gain in cubic capacity, which, I repeat, must not be confounded with area, of which there would not be the same excess, although it is always beyond the demand for accommodation. The excess is observable in all the convent schools wherever situated.

in Church Education Society's schools.

134. The schools of the Church Education Society in the country are no exception to the rule. In the rural parishes of Tullagh and Baltimore 2 schools, attended by 28 children, had room for 179, and in the country parishes of Enniskean and Ballymoney, 2 schools, attended by an aggregate average of 55 children, were large enough to contain 347.

135. Very few schools fell below a good standard in this respect, and they were all National schools. The two departments of the Ballinora school, capable of accommodating 161 between them, are attended by an average of 238; the Cove of Kinsale National school, with room for 125, was attended by 131, and the wretched cabin in which a National school is taught at Belgooley is made to accommodate 53 children, having space for no more than 40. This excess in school accommodation is owing chiefly to emigration and the loss of population by the famine. At Kinsale, the convent school, which ten years ago was attended by 600 girls, has dwindled down to half that number. The incumbent of Ballymodan parish, Bandon, told me that they had lost more than 700 Protestants in twelve years. It is not wonderful, therefore, that the schools are not filled.

Number of scholars on the rolls of different descriptions of schools.

136. The number of scholars on the rolls of the schools visited amounted to 18,025, and the number in attendance 10,473. They were distributed as follows:—

Description of School.	Number on Rolls.	Numbers present at visit.
Ordinary National, .	6,375	3,161
Conventual, . . .	6,447	3,110
Conventual, not National,	4,326	3,510
Church Education, . .	559	371
Private, . . .	318	318
Total, . .	18,025	10,470

137. As registers are, as a rule, kept regularly and systematically only in those schools which are in connexion either with the National Board of Education, or with the Church Education Society, or the Christian Brothers, it is impossible to arrive at any definite conclusion as regards the numbers of scholars who are supposed to belong to any other classes of schools. The unaided convent schools and all the private schools belong to this

class, and all that could be done was to endeavour to get some approximate information, or to take the numbers actually present on the day of visit as representing the full extent of the pupil element.

Statistics of National schools not quite trustworthy.

138. And even the National school registers must be treated with some reserve, and their returns not so fully trusted as they claim to be. For, owing to the rule which requires 13 unbroken weeks to elapse before the removal of an absentee's name from the rolls, it happens not unfrequently in the towns that the same child's name is enrolled at the same time on the books of two schools (or sometimes three schools, I have been informed), and thus two scholars in a general summary are returned for one; and again, owing to the same rule, it happens in almost every school that numerous scholars are returned as attending who have never made any attendances at all. Instances illustrative of both these cases came under my own observation. At Kinsale, on the occasion of my first visit, the convent school was closed, and several (I discovered 6) of the pupils were sent to the mixed school at the Cove of Kinsale, and, of course, in the returns from each school of the number on rolls, these children are counted as 12 distinct scholars. In Cork likewise I met the same children in different schools. The holidays happening at different times occasions this to a great extent, as parents do not seem, although they do not check irregularity, to appreciate holidays, which are the great harvest time of the private schools. Then again, the people are capricious and changeable about schools, and remove their children frequently from one school to another, or if a teacher seems to be inefficient in comparison with another the children forsake his school in numbers. There had been an excellent teacher at a boys' school in Cork up to a short time previous to my visit, who attracted large numbers of pupils. He was, poor man, drowned in a fit—I was informed—of intoxication, to which report says he was addicted more or less. Another man was appointed, and in the course of a few weeks the attendance had fallen 20 per cent., and was rapidly falling when I visited the school. Now, a diminution of 20 per cent. in the course of the quarter, while not affecting the return of the numbers on the rolls of that school, would swell the rolls of another school, and, in a summary, there would be higher figures than there would be scholars. The National teachers informed me that no one knew the extent to which this prevailed, and I can quite believe it.

139. From the returns of the attendance of children at the National schools, I gathered some curious information as to the number of scholars who may be returned as on the books, but who have never been at school. Thus I had returns of 50 boys on the rolls of one of the Presentation Monks' schools in Cork, who had never made a single attendance. At the Sundayswell boys' school 12 boys were returned as on the rolls, but with no attendances. At Blackpool school 24 boys had made no attendances, and so on. I cannot think, therefore, that the returns of the National Board regarding the numbers enrolled in the books of their schools can be treated with entire confidence.

Classification.

Proportions in each class for all descriptions of schools.

140. The classification of the scholars deserves notice. Private schools are not included in these remarks, as they possess no system of classification. The proportion of children in each class for all classes of schools was:—

First Class.	Second Class.	Third Class.	Fourth Class.	Fifth Class.	Sixth Class.
37·6	28·8	20·7	10·2	2·3	·4

141. It will be noticed how large the proportion of scholars is in the lowest class, which has the advantage of having included in the calculation the schools of the Christian Brothers, in which the per-centage for that class is not much more than 20. And so large are the two classes below the third, that a per-centage of only 12·9 expresses the proportion of scholars whose education can be considered as anything more than merely elementary. If my observations on the small number of children under 6 attending school are borne in mind, this per-centage will assume a more important aspect. It is, however, very much greater in the schools in connexion with the National Board as a rule, while it is lowest in the schools of the Christian Brothers and the Church Education Society.

Per-centage in each class in ordinary National schools.

142. The average per-centage of scholars in the first class of the ordinary National schools is 40·9, or very nearly 41; in the second class 31 and a fraction; in the third class 18·8; in the fourth class 8·5, and in the fifth class ·6 per cent. In particular districts these per-centages vary considerably, but are always highest in the lowest classes in the larger towns. Cork I found to be the most unsatisfactory in this respect, for of 3,257 children on the rolls in the ordinary National schools 46 per cent. were in first class, 28 in second, 17 in third, 8 in fourth, and 1 in fifth, or very nearly one-half of that large number of children, among whom there were very few children under 6 years of age, were in the lowest book of all, and not more than 9 per cent. above Third Book. In three other districts the proportion in the first class is pretty nearly the same. Kinsale takes the next place after Cork—the per-centage for the first class being 45·5, for the second class 32·9, for third class 12·8, and for fifth ·2, the per-centage above third class being not more than 8. In two other districts, Skibbereen and Bandon, the first class presents a more hopeful aspect, containing not more than 35·5 and 34·7 per cent. of scholars respectively; the second class is more gloomy than elsewhere, as 32·9 and 37·1 per cent. respectively represent the extent of that class in those districts, while the per-centage above third class is, in Bandon, 13·2 (the highest I met with in any National school), and in Skibbereen 8·6 per cent.

In conventual National schools.

143. In the National conventual schools the general average per-centage of children in the first class is pretty much the same as in the ordinary schools, being 41·5 in first class; in second class, 28; in third class, 20·7; in fourth class, 7·6; and in fifth, 1·3. In two districts, Kinsale and Bandon, the per-centages in first class are 49·3 and 48·4 respectively, which is owing to babies being taken in those schools in greater numbers than elsewhere.

Conventual, not National.

144. In the conventual schools not aided by the State we find a much more satisfactory condition of things. In the first class, 27·1 represents the proportion of children; in the second, 25; in the third, 27·4; and in the fourth, 22·8. Among these schools I include the Christian Brothers, who have a larger per-centage of scholars in the fourth class than any other class of schools. It reaches 28 per cent. The presence of a considerable number of infants in two of the nuns' schools included in this calculation, who are counted in the first class, gives a still more favourable aspect to these schools viewed in this respect.

Church Education Society.

145. The schools of the Church Education Society also stand very favourably in some cases as regards the distribution of their pupils in classes; for I find that in their first class there was not a greater proportion of children than 31·3 per cent., which is so high only in consequence of the inclusion of certain schools with infants in the calculation. In their second class there was a per-centage of 26 scholars; in the third class of 23·8; in their fourth class of 17; in the fifth of 3. There was also a very small per-centage of sixth class scholars.

Ages.

146. The ages of the children who compose these classes are high; and so the preponderance of numbers in the two lower classes, and the very small proportion above the third class in the schools which do the greater part of the work of the country, make it an important subject as regards the rate at which children advance in the schools. From the census it appears that the majority of the children attending school in Ireland are between 7 and 12 years of age, the children under 7 coming next to them, but at a great distance, while the numbers between 12 and 14 are very small. In Cork, in May, 1861, there were present

in school 8,124 children between the ages of 3 and 14, of whom only 2,048 were under 7, and only 941 above 12 and 14; while 5,796 were between 7 and 12 years old, or 71·3 per cent. Those proportions remain unchanged, and we have, therefore, with 71·3 per cent. of children between 7 and 12, comprising the majority of the attendants in the primary schools of the country, as large a proportion as 37·6 in the lowest class in all descriptions of schools, and in the National schools more than 40 per cent.; while we have only 12·9 per cent. in the highest class in all descriptions of schools, and in the National schools not more than 8·5 per cent. in the fourth class. It is not an encouraging sign of the educational proficiency of the country, this preponderance of numbers in the lowest classes, if we bear in mind the ages of the children.

Average daily attendance.

147. The average daily attendance of 18,025 scholars in all description of schools visited amounted to 10,900, being a proportion of 60 per cent., or not more than $\frac{3}{5}$ of the number enrolled. With the exception of the Christian Brothers' schools, I think that, with variations on either side, that per-centage may be taken as the correct expression of the attendance of children at school.

Christian Brothers' schools.

148. The average attendance in the Christian Brothers' is remarkably high, and must be considered quite exceptional. Indeed, I know of no primary schools in either of the three kingdoms in which anything like such a high proportion of attendance can be found. In Cork they had at the beginning of last year 1,990 scholars on the rolls, of whom 1,610 were in daily attendance, being 80 per cent. or $\frac{4}{5}$; while at Midleton it was only a fraction per cent. less, although the school had been in operation only a year when the return was made. The number on rolls was 502, and the average 399. This regularity is owing to the great popularity of the Brothers, and to the consequent run upon their schools for education; to their own efforts to secure regularity; and, lastly, to the presence in their schools of a considerable number of boys of a better class, who, by their regularity, set a good example to the others.

Church Education Society.

149. The schools of the Church Education Society come next to the Christian Brothers' in point of attendance. The daily average attendance for all the schools I visited stands in the ratio of 75 per cent. to the number on rolls. Of 559 scholars on the rolls, 395 were in daily attendance, being 75 per cent., within a fraction of the former number, or only one-fourth less. In Cork the proportion of attendants is higher, being as much as 78 per cent. In Bandon it is slightly over 73 per cent., and 70 per cent. is the minimum in every district except Skibbereen, where, in the rural parishes, not more than 53·2 per cent. of the number on rolls can be said to attend school daily. The comparative regularity observable in these schools is, no doubt, owing to the fact that the Protestants are of a better class generally than the mass of the people, and to their small numbers which thus brings them more into personal contact with the clergy and members of the Established Church, who are, as a rule, not backward to promote education.

Ordinary National schools.

150. The ordinary National schools fall many degrees below them in this respect. In six districts, the total number on rolls was 6,375, but not more than 3,470 were daily attendants, being 54·4 of the former number, or not much more than one-half. Cork stands lowest, for of 3,257 children attending school in that city, only 1,643, or 50·4 per cent., could be said to be regularly present. A large city may have the means of education close at hand, and they may be abundant, but unless some pressure is brought to bear upon the people, the inducements to keep their children away are sufficiently numerous and strong to keep the attendance at school low. The lower classes in the towns are much more difficult to deal with than the corresponding classes in the country, and it appears to be one of the most difficult tasks to awaken them to any general sense of the importance of having their children educated; and if these schools possess so few attractions for either parents or children, it is not difficult to imagine why they are so badly attended. Perhaps, too, the presence in larger numbers than elsewhere of young children may account, owing to their great irregularity, for the low average attendances in Cork; nor must the fact of the same names being enrolled in different schools at the same time be lost sight of, as partly explanatory of this.

Average attendance in town.

151. But matters are not much better elsewhere, as in only one district (Bandon) does the attendance rise to 72 per cent., while in two others it reaches only 62 per cent., and in the remaining two it sinks to 55 and 52 per cent. respectively. Striking contrasts are observable in the average attendance of the schools in the same town even. Thus, while one National school in Bandon has an average attendance of 86·7, another has only 55·5 per cent.; or if, in Cork, the St. Patrick's male school boasts as high an average as 76·6 per cent., the almost neighbouring school in Paradise-place is down to 55 per cent. The superiority of the teacher, either actual or supposed, I have invariably found to be at the bottom of the difference.

In country.

152. It is in the rural districts that the lowest averages exist, which is more intelligible and excusable than in the towns. In 10 rural schools, in widely distant localities, extending from Shirkin Island on the one side to Midleton on the other, the average attendance was not more than 55·1 per cent., 1,130 being the number on the rolls, and 623 the number in daily attendance. In neither of them was 70 per cent. reached, 4 being between 60 and 66 per cent., 3 between 51 and 57 per cent., and 3 between 39 and 48 per cent., excluding fractions. Some of the localities in which I found these schools are very thinly inhabited, and the people poor, so that distances, inclement weather, and the value of the children's labour during the harvest time, combine to make the attendance irregular. Low as the average for these ten schools is, I am inclined to think it is too high, as several of them being small, the usual expedients would be resorted to, of which I shall speak farther on, to show a daily attendance of 30 in order to avoid a diminution of salary.

Conventual National Schools.

153. The average attendance in the Convent and Presentation Monks' schools stands lowest of all, since not more than 52·8 per cent. of the children entered on their books can be said to be at school daily. In five schools I found an average attendance of only 3,408 scholars, as against 6,447 enrolled, or 52·8 per cent. of the latter number. In only one convent was there anything like a good attendance. It was in the Queenstown Convent School, which was attended by 523 girls daily, out of 638 enrolled, or by 81·9 per cent. In two districts it was as low as 46 per cent., one of them being Cork, where the attendance in these schools is not more than 46·7 per cent. It is not so difficult to explain these low averages, which are at first sight doubtless perplexing, considering the attractiveness of the convent schools. In a place like Cork the presence of infants in larger numbers at their schools than elsewhere has, owing to their irregularity, a depressing effect on the average attendance, and the schools in the smaller towns are attended by so many children from long distances in the country, who are made irregular by bad weather, home duties, labour, &c., &c., that the same effect also is produced in them. The numbers on the rolls are enormous, but the actual attendance is not at all commensurate with it. In St. Finn Barr's Convent School in Cork there is a vast total of 1,228 girls on the books, but when I came to investigate the actual number present daily, I was disappointed to find that that could be said of only 645 children. Similarly in Bandon, there were only 396 girls in daily attendance, out of 850 on the registers of the convent school.

Explanation of high average attendance in small National schools.

154. I have alluded above to the probability there is of the average attendance being exaggerated in the case of the smaller schools. Indeed, a certain license appears to be granted by the National Board which enables the teacher, by excluding wet days, or days during the prevalence of illness on which the attendance may fall

slightly, from the calculation of the daily attendance. This is permitted, I have no doubt, to avoid the necessity of enforcing the rule which inflicts the penalty of a reduction of salary on the teachers if the average attendance of the school falls below 30. But I fear that unsatisfactory as it is to go even to that extent permissively, greater liberties still are taken by needy teachers by resorting to fictitious entries of attendances, when the plan of omissions of days would be inadequate to save a reduction. The buoyancy of the average attendances in the small and remote country schools was very suspicious, because it was a phenomenon that was rare in districts more favourably situated, and was observable just where it would be most valuable. Thus the little school at Clogheen, near Cork—a poor place in every respect—with 43 on the rolls, had an average attendance of 34·5, or 79 per cent.—as great a proportion as in the Christian Brothers' schools. The size of the school will suggest at once the probability of the necessity for using every expedient to bring out as high figures as possible in the average; and it illustrates very well one of the permissible methods of so manipulating the calculations of the average attendances as to evade the enforcement of the fine. I found that previous to my visit scarlatina had been prevalent in the village, and several scholars caught the infection, and their absence lowered the ordinary attendance, although it never seemed to go below half, and in most instances was much above it. Nevertheless, for several months, the days on which there had been *any* diminution were excluded. Thus, three days in January, 1868, although *on them* the attendances out of a total of 43 on rolls were 33, 28, 28, respectively, in calculating the average, the master told me, would be left out. The average would have been below 30 had all the days in question been included. At Kilmacabea National school, with only 78 on rolls, 50 were returned as in daily attendance, or 64 per cent. In Shirkin Island boys' school 35 were returned as daily attendants out of a total of 50 on rolls, or 70 per cent. Now, bearing in mind the circumstances of locality, efficiency, &c., &c., attending these schools, and the rate of attendance in other rural schools more advantageously situated, I cannot think that their returns are quite to be trusted. I took the trouble in several instances to have the average calculated twice—first, excluding wet days, &c., and then including them, and the comparison of the results showed invariably in favour of the school.

155. This is an evil resulting from the system of not paying by results, for if numbers alone are to be the evidence of the teacher's deserving an undiminished salary, the certain tendency will be to encourage fraud and trickery—a temptation, however, which besets only small schools to any extent, since a fall in numbers sooner affects them than larger establishments. I am unable to see how it is possible to prevent it entirely. I heard two Inspectors say that, unless by accident, it was quite impossible to detect fictitious registers.

Average number of days spent in school yearly.

156. After the facts that have been stated relative to the average attendance in all classes of schools, it is scarcely necessary to say that irregular attendance is the rule and regularity the exception. But statistics concerning the average attendance of children, give no idea of the proportion of time spent, on the average, by each child at school. I took some trouble to arrive at a clear notion about the matter. My plan was to add up all the attendances which had been made during the year, and divide the sum by the number of scholars who had made them—the quotient would of course be the number of attendances or days (they are the same in Ireland) made by each child. The different classes of schools stand nearly in the same order in this respect as they do regarding the average number of pupils in daily attendance—the Christian Brothers coming first, the Church Education schools next, after them the conventual schools in connexion with the Board, and, last of all, the ordinary National schools. The following table summarizes the conclusions at which I arrived.

Description of School.	Number of days open on Average.	Number of Days each Child attended on Average.	Proportion per cent.
Christian Brothers, . . .	215	176	81·3
Church Education, . . .	220	100	45·3
Conventual National, . . .	200	86	43·4
Ordinary National, . . .	220	79	35·8
Total, ...	213·	85·1	39·9

In the above table I am unable to be certain about the Church Education Society, as their registers are not always kept very accurately, and I was, besides, unable to get returns from several of their schools, but I believe that in all the other cases the statistics given are accurate.

Causes of irregular attendance.

157. The causes of the great irregularity which it is evident prevails in the majority of the schools are not difficult to explain. Poverty, and the severity of the weather in winter combine more than anything else to produce irregularity at school; nor is the unattractiveness of the schools a slight cause of the evil, which is also further aggravated by the carelessness and over indulgence of parents. But I believe the most prevalent cause is the first mentioned. It is the one invariably mentioned by the teachers of all descriptions of schools without exception. The records of the schools which note at the end of each month the proportion present in attendance quite bear out the assertion. They all, with a curious uniformity, indicate the months of December, January, and March as the periods of the year at which the school attendance is lowest, and May, June, and July as those at which it is highest, and give between 40 and 50 per cent. as the lowest points to which it falls, and 65 and 75 as the highest to which it rises. In very poor neighbourhoods, such as the town of Kinsale, the children during the winter take refuge in the poorhouses, and are, during the time they are there, regularly at school. When the warm weather begins to return they leave the Unions, and the school registers are filled again. The absence of suitable arrangements for warming the schools during the winter, and of any inducements, such as prizes for success or rewards for regularity of attendance, are so many negative reasons for bad attendance, to which the carelessness of the parents does not contribute a little. In the purely agricultural districts the attendance falls as there happens to be any occupation which the seasons bring round. Seed time and harvest, haymaking and potato gathering, &c., &c., all act detrimentally to regular school going.

158. One of its worst features—and one entirely inexcusable—is its existence at periods of the year when neither bad weather nor occupation can be pleaded in excuse of it. And it so breaks up into disconnected periods those intervals of time which, small as they are, would be valuable as giving opportunities for some continuous instruction, that no real progress can be made, and the effect is, that while his years increase the child's education remains comparatively stationary. Much might be done in three months of regular attendance, but if every alternate week is omitted, advance is almost hopeless. I was struck with two boys whom I saw at the Ballymartle National School; they were farmers' sons, and although 16 and 17 years of

age respectively, were not higher than the Second Book, which they read too imperfectly to secure their passing in reading. They had been at school, off and on, for 10 years, and were unable to write a word from dictation, or to do a sum in multiplication. They were irregular attendants—that is, never at school for a month consecutively, which, of course, accounted for their backwardness.

Irregular attendance may be remedied.

159. The evil, although a great one, is not quite incurable. I endeavoured to make out what people on the spot thought might act in a remedial way upon it. A few were of opinion that compulsory education would be the best thing; others said "let the schools be religious, and it will diminish," but no one seemed to think that the schools might be so managed as to attract the children and influence the parents in favour of sending them to school. It did not seem to strike anybody that the school-rooms were insufficiently, or not at all, warmed, and that children would be slow to go, as their parents would be slow to send them, where they must shiver in their rags for hours together; nor did it seem to occur to any one that by introducing some method of rewards sufficient interest might be created in coming to school as would produce regularity. Thus keeping a record of regular attendances, and, at the end of the month, rewarding several of the most regular with some little distinction, however trivial, would stimulate an interest in going to school.

Remedies.

160. At present no kind of efforts are made to insure regularity of attendance. Schools are established and are left to the teachers and the scholars, but the admonitions of the former fail to produce regularity; another obstacle to which exists in the payment of fees *after* the child has been at school. Parents do not consider that payment is due unless their children have been attending school the whole week, and that feeling acts as an inducement to keep them away for half the week in order to avoid payment at its end. The remedy for this would be to require payment of school fees in advance. A gentleman suggested that it would be a good thing if the National Board were to give prizes in their schools. Of the utility of prizes there can be no question, but whether they should be provided in the manner he suggested seems to admit of some doubt, as it would be relieving the local public too much of the duties it ought to discharge in the cause of education.

161. I cannot allow this opportunity to pass without saying a few words on the good that might be done if the Catholic clergy, who are almost all without exception the patrons and managers of the National schools, would take more pains to teach their people the duty of sending their children to school regularly, and would—not content with that only—also take such a detailed interest in their schools as would quicken a similar interest in their parishioners. They do not do so now as a rule. The schools may be visited, or they may not, but the results are pretty much the same in either case, since the visits seem to be made without any very definite objects. I heard of only one instance in which the manager examined his school, but I know of cases in which the schools are hardly ever visited at all. Here and there an address may be delivered from the altar by the parish priest on the necessity of being regular at school, and his admonitions may take effect for a time, but as they are not followed by any action on his part, things soon fall back into their old condition. In the case of the school to which I have alluded as forming an exception to the general rule, I found the happiest results attending the manager's personal superintendence of it. The teachers were vigorous and full of interest in their work, the children were regular, well behaved, and neat and clean in their dress, and formed a striking contrast to the general run of National schools. I refer to SS. Peter and Paul National schools in Cork, which are under the special care of Rev. Canon Maguire, who visits them frequently during the week, inquires carefully about the attendance, visits the parents of irregular children, inspects their condition as to cleanliness and neatness, makes them all come to school in a uniform dress, examines them himself not unfrequently, and takes a not inconsiderable share in their religious instruction, and advocates his schools from the pulpit. The consequence of all that is that his schools are well attended, and are better conducted than most of the schools I saw in Ireland. The clergy of the Established Church are very much to be commended for the care which they take to make their schools effective.

Age on coming to school.

162. The average age at which children begin to attend school in Ireland varies with town and country. As there is no feeling yet among the people in favour of sending very young children to school, the earliest period in Ireland is, I imagine, considerably higher than in England. In the latter country, so far as my experience enables me to form an opinion, the average age, in the towns, is between three and four. But in Ireland, in the towns, it is five, while in the country it is somewhat above six, although not much. In the convent schools in Cork the average age is four and a half, while in the same class of schools in the smaller towns it is nearer five, the difference being attributable to the distances from which a large proportion of the children attending these latter schools have to go, which reason also explains the difference generally observable between town and country. Now, although these ages are attained before the work of education regularly begins, it is not uncommon to find many of the more advanced children (as regards age) who have mastered the alphabet before going to school. The elder children, chiefly the girls, are made to teach the little ones in the evening after their return from school, and so lay the foundation of their instruction at home.

Age on leaving.

163. The average age of leaving school I made out to be for boys, in the towns, 13, and in the country, 14; and for girls, in town and country, 14, or nearly 15 years of age. In this estimate the convent schools are included. The average time, therefore, spent at school cannot be considered as less than eight years; but when the average time spent by each child in school is deducted from that, viz., not much more than one-third of the whole time he ought to be there, the actual period is not much more than three years, which, I think, will support the following assertions as to the time which is spent in getting through each book.

Time occupied in passing through each book.

164. I endeavoured to gather from the teachers some information about this matter, and they generally agreed with each other in saying that 18 months was the minimum time in which children were carried through the First Book, but I believe, judging from the ages of the children in that book whom I examined, and from the great number of children who seemed to leave school finally in the Second Book, that not much less than three years can be said to be the time, which would just bring the children in the country up to 8 years old when commencing the Second Book, and in which it is the rarest thing to find children below that age. It is not wonderful that so much time is taken up in accomplishing so little, considering how imperfect the method of teaching young children is in the Irish schools, and the irregularity in attending school; it would be wonderful if it were not so. How can a child not yet taught how to learn, be expected to advance more rapidly when he is only one-third of the year at school, and that not consecutively but at broken intervals?

165. It is in the Second Book, I believe, the majority of the children in all the National schools stick, and those who complete it do not do so under two years, the Third being got through in two more, and the Fourth not got through at all, but remained in for a year, at the end of which the time for leaving school arrives. Not more than 10 per cent. of the scholars ever reach the Fourth Book; and the most serious aspect of the case is that the majority of the children who remain at school do not succeed in getting, as I have said, beyond the very elementary Second Book, which they know, besides, only very imperfectly.

166. Now, the education of the country cannot be said to be in an efficient state under such circumstances.

But what effectual remedy can be applied in the face of the difficulty which the irregular attendance of the children presents? I answer, legislate so as to get as much regularity as can be got, if a compulsory system is not introduced, by fixing a minimum of attendances to be made by each scholar as an essential qualification for bringing a grant to his school, and those who are locally interested will not be slow to devise the means of securing a fair school attendance. Self-interest will set invention to work. It is idle to say that the majority of the children could not attend at school 100 days in each year, which seems to be the lowest reasonable limit that should be fixed. This would insure attendance. But besides that, progress must likewise be insured, and the most made of time, to effect which I would require every child to be examined in a higher class each year, and would allow no public grants for any scholar above 14 years of age. Unless these two methods are adopted, I am unable to see how the evils of which I have been speaking can be dealt with effectually.

Remarks on scholars above fourteen years old.

167. With reference to the suggestion I have made regarding children above 14, I desire to say a few words here. It is very well known, I believe, that children of advanced ages are more numerous in the Irish schools than in any others. It is most commonly observed, however, in the convent schools. The absence of any staple industries in the towns, and, indeed, the general scarcity throughout the country of occupations for women, at once explain its existence. Now, I do not complain of the presence of such persons in the schools if they choose to go, and if they are freely taken. What I object to is, their being paid for by the State at an age when they are old enough to take care of themselves. If they are allowed to go to school, they should not be enrolled as scholars. It is out of all reason that young men and women above 17 years of age should be continued on the class rolls of primary schools. I have seen young men of 18 and over 22 in the classes of the National schools. In one instance, I met a young farmer, who, although 21, was counted as a regular scholar, and attended and took his place among the little boys with praiseworthy regularity. In the rural districts it is a common thing for the young men during the winter, when there is no field labour, to go to school, to which, in itself, I can have no objection, provided only these individuals go in a strictly private capacity, and pay for themselves. A reference to the tables on pp. 140–43 will show to what an extent it prevails in the convent schools, which are allowed strangely enough to count their monitors as pupils, the fifth class being invariably composed of them; so that the convents are paid both for teaching these girls as monitors and as scholars.

Registers.

National Board.

168. I do not know that there is much to be said on the head of registers beyond expressing satisfaction with their excellence and with the manner in which they are kept. I refer to the National schools, for of the others not much can be said. The National schools are supplied with three distinct books, the "Class Rolls," the "Daily Report Book," and the "Admission Register." On "the rolls" the names of the scholars are entered in separate classes, and their daily attendance is recorded in spaces which are of sufficient number to last during one whole quarter, and are extended over two pages, at the end of which are columns in which is a summary showing the number of school-days the quarter contained, the number of days the scholar was present, and the number of days he was absent. In this book are also recorded the religious professions of each child, and the rate at which he pays school fees. The "Daily Report Book" is, I consider, a most useful one, as in it is made a daily entry of the number on rolls, and of the number present in each class, and these figures are summarized at the end of the week, and again at the end of the month, so that it is only necessary to look at the bottom of the page allotted to each month to ascertain the total number of attendances that have been made, the average number on the rolls, the average number present, and the proportion per cent. between them. There are also, in their places at the end of the book, quarterly summaries, to which if an annual summary were added, it would be a complete record of the attendance of the school. In the quarterly summaries are included the amounts received in school fees, and the amount of school requisites received. This book likewise contains the entries of grants of all descriptions made to the school, and is its account book. The "Admission Register" contains the names of the scholars, the dates of admission, residence, occupations of parents, and records, under their several dates, their progress from class to class, and the dates of their removal from the school lists, and their ultimate destination. There is another book in which the Inspectors make notes of their examinations of the schools, and such other observations as they may think useful. The class-rolls are marked every day at noon, and at the end of the day they are added up and the results entered in the "Daily Report Book."

Defects.

169. It is impossible to refrain from noticing the strangeness of the regulation which requires the attendance of scholars to be recorded only at noon, as it seems to leave so much room for not attending school fully, for by it the school is able to count the attendance of a child who may not have been present a longer time than was sufficient to answer to his name. There is no guarantee whatever that a certain amount of time has been *bonâ fide* spent in school. To counterbalance that, however, a rule exists requiring a slate to be hung up in the school, on which the names of any children who leave before the closing of the school must be inscribed, but it did not seem to be very generally complied with. It would seem to be a much more efficacious plan to divide the day into two parts, and fix a minimum of two hours, during which the scholar must be present in order to be counted as having attended, and to have the rolls marked at the commencement of each meeting of the school at a fixed hour in the morning and afternoon. The custom of leaving a scholar's name on the rolls of the school for thirteen consecutive weeks of absence before striking it off should also, I think, be abolished, and a much more limited time fixed. I have noticed the effect it has of complicating and rendering fallacious the statistics of the National Board.

Registers well kept.

170. I am glad to be able to say that I found the Registers kept with much care and neatness. Indeed their condition was wonderful considering how old they were in most cases. The entries regarding religion were carefully made. I found them omitted only in two instances—one was in a convent school, where, owing to the entire absence of Protestants, the teachers had thought it unnecessary to do it; and the other in the case of an ordinary school, where it had not yet been done at the time of my visit, the master said, but would be. I could not make out how far accurate the entries under the head of school fees were, but it was impossible to check them without unravelling the class rolls, for which there was no time.

Registers of Church Education Society.

171. The Registers of the Church Education Society would be useful if they were perfectly kept, but as they are not, their value is not great. The attendance of the children, and their classification are always recorded, but no mention is made of religious denominations, and the Admission Register is in most schools so badly kept that no reliable information could be got respecting the rate of the children's progress, or the ages at which they leave school.

Christian Brothers.

172. The Christian Brothers have only one register in which the same particulars, except that of religious denomination, are given as in those of the National schools. No class rolls are used, but the number of boys present is noted, and weekly summaries are kept in a note-book by the superiors, who, at the end of the year, make use of them in calculating their annual returns to be sent to the central house in Dublin. Their custom is to strike off any scholar's name who has been absent for two weeks consecutively.

Mixed Education.

173. Education in the district which I visited is practically denominational. It seems to be unnecessary even to assert, much less to attempt to prove, this, since the separation of the youth of different denominations in separate schools is one of the most prominent features of education in the south of Ireland. This is not wonderful, seeing that the people of one religious denomination so enormously preponderate that in the chief city of the south of Ireland, which contains a large Protestant community, the members of that community stand in the proportion of not more than one in six to the Catholics. That proportion would of course be preserved in the schools, did even mixed education exist, and the predominance of the members of one faith would give to the schools at least a denominational aspect. But besides the force of numbers, the strength of the determination of the members and clergy of the Established Church to unite with the National Board of Education only on the condition of the acceptance of their own views with respect to the use of the Holy Scriptures in every school, and the necessary refusal of that body to adopt those peculiar views, gave a more distinctly denominational colouring to the educational machinery of the country; and it had this most important effect, of leaving the National schools entirely in the hands of the largest religious body, the Catholics.

Education practically denominational. Reasons:— (1) Predominance of Catholics. (2) Dislike of Established Church to National system.

174. This gave them a practically denominational character, which was again increased by the exclusive control which the Catholic clergy acquired over them, so far at least as patrons and managers have any power. That clerical influence had the further effect of scaring away from the schools the small body of Presbyterians and dissenters, who immediately seized the opportunity which the facility of opening non-vested schools afforded of having schools of their own. And thus the National Board, while maintaining its neutral legislation on the hypothesis that its school attendance was mixed, has been forced into encouraging denominationalism with one hand, which, with the weapons of its legislation in the other, it is unceasingly threatening to destroy.

(3) Clerical Managers. (4) Withdrawal of Presbyterians

175. If the National system had succeeded in its object of uniting the different religious denominations of Ireland in its schools, we should not find in the same localities, separate National schools for the Catholics, for the Established Church, for the Presbyterians, and for Dissenters. That such is the case a glance at Cork will suffice to prove. In that city there were last year 22 separate schools (departments), including the Model Schools, which were distributed according to religions as follows:—10 were attended by Catholics, and under the management of Catholics, 6 belonged to the Established Church, and were under clerical patronage, and 3 were Presbyterian, and under the care of the clergy of the Presbyterian Church, and 3 constituted the model schools.

National system failed. Schools in Cork.

176. Ten departments were affording education to an average attendance of 2,705·2 Catholic children, 6 were educating 212·2 children belonging to the Established Church, and 3 were educating about 153 children, for the most part Presbyterian, but many of them members of the Established Church. There was once a Wesleyan school as well, but it was closed at the opening of the Model Schools. It must be borne in mind that the managers of the Established Church and the Presbyterian schools above alluded to are all of them warm supporters of a mixed system of education, but do not make use of the Model Schools, which are just the institutions they most desire to see established throughout the length and breadth of the country. One of the hottest advocates of the mixed system is the originator of the new Presbyterian school in Queen-street, not more than a mile distant from the Model schools. Holding the views he does, I am utterly puzzled to explain his motives in opening a school for which there is no need at all.

Children of different religions in them.

177. I come now to consider whether there is any mixture of religions in the National schools, as it may be objected that such does exist. In the case of the National schools attended by Roman Catholics and directed by the clergy of that body, I unhesitatingly say that there is no mixture of religions in them. The National schools in connexion with the Established Church, and the Presbyterian schools, do contain pupils of different creeds, the mixture being most perceptible in the latter class.

No mixture of religions in Catholic National schools.

178. The following facts will bear me out in my assertion:—I visited 46 National schools under the management of the Catholic clergy, and found on their rolls 9,596 names, of which 21 only were recorded as members of the Established Church, and one only as Presbyterian. The following short table will make it plainer:—

Statistics.

Religious Denomination.	Number on Rolls.	Per-centage.
Roman Catholic,	9,574	99·697
Established Church,	21	·284
Presbyterian,	1	·019
Total on rolls,	9,596	100·

179. In Cork, where Protestants are more numerous, it might be thought that they would be found in greater numbers in the National schools. But it is not so even there. In the twelve schools to which I have alluded above, only 5 Protestants appeared on the books, on which 4,339 names were enrolled.

180. Wherever I went the same facts presented themselves. In the rural districts, occasionally 2 Protestants, or 3, or 4 (I never met more than 5) would be found in the National schools. Thus, at the Ballinora schools, 5 little members of the Established Church were attending, 2 of them going to the girls' school, and 3 to the boys'; at Castlemartyr National school there were 4 Protestants, and so on. The presence of these children may be accounted for, in the towns, by mixed marriages, and, in the country, by the absence of schools of their own near enough for them to go to.

In county the same.

181. In seven schools or departments connected with the National Board, and under the management of the Established Church clergy, I found 373 children enrolled, of whom 10 were Catholics, 356 belonged to the Established Church, and 7 were Presbyterians, giving a per-centage of 95·4, 2·7, and 1·9 of each denomination respectively. The number of Catholics, though small, contrasts strangely with the proportionately still smaller number of Anglican Protestants in the Catholic schools. I was unsuccessful in getting any explanation of it. There was no reason to suspect proselytism, since the managers of all those schools are known to be careful in avoiding anything like meddling with the faith of their neighbours. I visited four Presbyterian National schools, but was able, in consequence of one of them being closed for repair, to investigate only three, on whose books 231 names were enrolled, 147 of that number being Presbyterians and 84 members of the Established Church; there were no Roman Catholics. The large number belonging to the Established Church is easily accounted for by the greater similarity of creed between them and the Presbyterians than between them and the Roman Catholics, and, besides, these three schools are much more middle than primary schools and thus attract the children of the lower middle class of Protestants of all classes.

National schools of Established Church.

182. In the three departments of the model schools at Cork, there were 644 names on the books on the occasion of my visit, distributed according to religion thus:—

Model schools.

	Established Church.	Roman Catholic.	Presbyterian.
Numbers,	434·	75·	135·
Per-centage,	67·4	11·6	21·

The presence of so many Roman Catholics in spite of the disfavour with which these schools are regarded by their ecclesiastical superiors is, to my mind, a convincing proof of the need that exists for good middle schools in Cork and elsewhere.

Church Education Society's schools.

183. The schools connected with the Church Education Society, which I visited, contained on their books 559 scholars, of whom 7 were Roman Catholics. I do not know how far all these establishments may be free from proselytising practices. I am bound, however, to say that I could discover no evidence of their existence, except in the Irish Industrial Ragged School in Cork, which, I was told by a Protestant minister, is known to be proselytising, and seemed to be the most open to suspicion. They profess to take no notice, and to ask no questions as to any child's religion who is admitted, nor is any record made on the school registers respecting it. The child is expected to go to church and that is all. I discovered, however, that there were two Catholics in the school, one of whom had been educated in the monks' school in Douglas-street. He seemed to be over fourteen years old, and had been placed there by his mother. The tastes or inclinations of the children are not consulted; but when I urged the propriety of doing so, was met with the rejoinder that they were free to go away if they chose. It requires more moral courage, however, than most children possess, to act with such determination, which, too, would be sure to bring them into collision in such a case with their elders.

Majority desire denominational system.

184. With the knowledge of such facts as I have stated, it is not surprising to know that the great majority of people with whom I came in contact were in favour of an adoption of the denominational system. It is the feeling of the Catholic clergy as it is the feeling of the Catholic laity, and their wishes are shared by the majority of the clergy of the Established Church.

Catholics unanimous for it.

185. No exception can be found to this unanimity of feeling among the members of the Catholic hierarchy in all its gradations; although, indeed, a few isolated instances occur of disagreement among the laity, but they are singularly few. I met only three Catholic laymen who advocated the maintenance of the present system; but one of them was too timid to say much, or to allow his name to be mentioned; another was young, and had not evidently mastered the subject about which he expressed glibly his opinions, and the only person of any weight was a magistrate who once owned the *Cork Reporter*, but although I sent him a circular and saw him twice, I was unable to get more from him than some strong expressions of dislike for any approach to a denominational system.

Clergy Established Church the same. Exceptions.

186. The Established Church clergy are almost unanimous for the adoption of the denominational system; but of late years there have been some defections from their ranks to the Board of Education. Four incumbents of parishes have schools in connexion with the National Board, which, in two instances, were in connexion with the Church Education Society. I refer to Dr. Webster's schools, to which I have had occasion to refer before, and to the Ballintemple parish school. The Rector of Garrycloyne, Mr. Perrin, and the Rector of Ballymartle, Mr. Stoyte, have both started National schools, if they can be dignified by the name, seeing that in neither case are there a dozen scholars on the rolls. It is fair to say that the teachers do not receive salaries—at least not so far as I know—the grants being confined to the usual free stock of maps, &c., &c., to commence with, and to the privilege of getting books; for which advantages the right of inspection is claimed and exercised. The master of the Endowed School at Kinsale, an unbeneficed clergyman, was warm in his advocacy of an undenominational system. These instances seem to me to bear out Dr. Webster's statement that a change is coming over the minds of his clerical brethren with respect to education. But whatever change may be coming, it is certain that the mass of the Irish Established clergy are at present in favour of denominational education, which being interpreted, means the State aid with the right of using the Bible without restriction.

Laity concur with clergy.

187. I believe that the laity of the Established Church are pretty much of the same opinion; some few, indeed, who desire earnestly to break down the wall of estrangement which separates them from their Catholic neighbours, are afraid of denominationalism, lest it should have the effect of widening the existing breach, and hesitate to adopt it. But even they do not resist the principle with any of the strength of a deep conviction; their opposition is at the most speculative.

Presbyterians oppose denominational system.

188. The strongest and fiercest opponents of the system are the Presbyterian clergy. They will hear no arguments in its favour, nor admit any good in it whatever. It is in their eyes wholly bad, both in itself and as regards the effects it will produce. These sentiments, however, would carry more weight, if not conviction, if their holders were more consistent, and would refrain from doing anything towards hurrying on the adoption of the denominational system by the Board by building schools of their own, and in places, too, where there is no reason whatever for their establishment. I believe that the secret of their opposition is the fear they have for their co-religionists, who, scattered in very small numbers over the country, would, not being able to provide schools of their own, be in danger of being absorbed into the religious bodies whose schools they were obliged to attend.

189. Having thus briefly reviewed the attitudes of different sections of society with respect to the religious aspect of the question of education, I pass on to explain the reasons which seem to influence them, and the feelings and wishes they entertain respectively.

Religious aspect of question of first importance.

190. It should be fully known and felt that this phase of the education question—the relation which should exist between it and a definite religious belief (which is the meaning of denominationalism)—is the one which is supreme in the minds of those who are in any way connected with the education of the people. The efficiency of the schools fade into insignificance beside it; while that is hardly noticed, the question of the relation it should bear to religion fills all minds. In the minds of the Catholic priesthood, as well as of the Catholic laity, the full recognition in the schools of the country of that relation would be the solution of every difficulty, and the introduction of the one thing now wanting to make the educational system of Ireland perfect. Its recognition would, they say, give a religious tone to the schools, which is now wanting in them; it would invest them with an interest in the mind of the public which they have never possessed; it would remove the difficulty which now besets the training of teachers; it would, by effecting that, secure an adequate supply of trained teachers; it would thus, incidentally, be the means of preventing the spread of revolutionary and socialistic ideas; it would abolish the vexatious, because unmeaning, regulations which at present obscure what the people believe and love; and it would remove those arbitrary and insulting disqualifications and hindrances which are now put in the way of the "religious" who act as teachers.

Benefits of denominational system.

Nothing in circumstances of country against it.

191. If there were another state of things existing, such for instance as exists in England, where the members of different religions balance each other, then, it is thought, there might be some reason for the present attitude of the Board of Education with respect to religion, and possibly there would be more willingness displayed to acquiesce in a neutral system for the general welfare of society. But since the mass of the people are united in religious belief, the maintenance of a legislation which was framed to meet the difficulty of a mixture of different beliefs in schools in which there is no such mixture, becomes intolerable through its unmeaningness and the arbitrary spirit which inspires it. No good can be effected by it—on the contrary, it stands in the way of doing good.

192. It is not wonderful that people feel strongly when, without any conceivable reason arising out of existing circumstances, teachers are forbidden to allow the practice of any outward act of their religion by large numbers of children who would be benefited by it, and which would offend no one, since no one would be present to be scandalized. A school of 600 is forbidden to make the sign of the cross or to say any vocal prayer out of the time devoted to religious instruction, in consequence of the possible presence of some one whose religious prejudices would be grievously shocked at such "superstitions and mummeries." Another school, taught by monks, with more than 400 scholars, is suddenly reminded that the sign of the cross, which the striking of a clock was the signal for making, must no longer be made, as it was a violation of the Regulations of the Board; and although the school was composed exclusively of Catholics, they were strictly enforced. The monks, unwilling to forbid the boys to continue the practice, removed the striking weight from the clock, and thus, no sound admonishing them, the practice died a natural death.

Present system meaningless.

Examples.

193. The nuns complain bitterly of being obliged, during school hours, to avoid all mention of religion, that is, of anything distinctively Catholic, and of being unable to use any of the symbols of their faith, except at stated times. The crucifix and the image of the Blessed Virgin, have each their respective cupboards, and are displayed only twice a day, being carefully hidden out of sight when the time for secular instruction recurs. The Superior of the Kinsale Convent, to which a large National school is attached, told me that she always felt humiliated to be obliged to close the doors of the cases in which those objects are kept. It looked to her like slighting and making of secondary importance things which should be supreme; and all, both monks and nuns, agreed in saying that the effect on the children is not good, for it has a tendency to make religion in their eyes a thing for certain times and hours, and not, what it should be, an atmosphere in which to live. The regulation which prohibits any allusion to religion during the hours of secular instruction removes all the opportunities which occur continually during the course of a day for instilling religious principles into the minds of the young, who, thus taken unawares, are more impressionable than when they are set formally to learn a lesson in Catechism or Scripture history at a stated hour. Such are the complaints of the "religious," and I own I cannot see that they are merely sentimental or unfounded.

Nuns complain of restrictions in religion.

Its effects bad.

194. With respect to the necessity for uniting education with religion by admitting the denominational system, the Bishop of Cloyne regards it as a great State question, upon the solution of which depends the stability or the opposite of the kingdom. For he considers that unless some religious belief is instilled into the heart of the rising generation, the effect of a mere cultivation of the intellect will excite desires and aspirations which may prove dangerous to society. The bishop, in other words, thinks that one of our dangers is socialism, which it is the tendency of merely secular education to produce, and knows no preventive against it so good as a sound religious education. He illustrated his remarks by pointing out to me the unsatisfactory moral tone which prevails in the National schools, owing to the absence in them of a good religious spirit. And he considers that that now negative spirit, will develop into one of restless discontent with good order, and will be the ally of revolution and of anarchy. Whether this will be the result or not of a perpetuation of the present system I know not. I can only say I agree with the bishop heartily in his complaint about the absence of a high moral tone in the National schools.

Denominational system concerns welfare of State.

Low moral tone of teachers dangerous.

195. I also agree with him in thinking it of the highest importance that some change should be made which will facilitate a good training system. The people are impulsive and highly susceptible to the influences which are brought to bear upon them. Their intelligence and readiness to acquire knowledge render them most liable to those influences which a cheap literature of too mixed a character exercises. Its "tall talk" and philosophic garb are too powerful for minds which have had no early training of a solid kind to enable them to detect and to resist its fallacies, and under the name of intellectual growth, they are falling victims to principles which, although they may possess no lasting vitality within them, are dangerous in a high degree.

Good training system needed; only possible on denominational system.

196. A residence in a training school sufficiently long to allow time for the acquisition of real knowledge, and of the best methods of imparting it, and for the moulding and formation of the mind and character would do all that can be done to make education effective in Ireland. But without religion as the basis of such a system it is hopeless to look for its establishment. The withdrawal of the National teachers from the training schools by the bishops is a pretty clear indication of their mind. And the instances I have given in that part of my report which relates to teachers is a good indication of their determination to act. The bishops all agreed in saying that of the two evils, the absence of training in the teachers, or their training under the present state of things, they far prefer the former. The Bishop of Ross regards a residence in the training schools in Dublin as dangerous to morals and destructive to religion. He assured me that he had known cases himself in which such consequences had resulted, and that for that reason, among others, as a bishop, he absolutely prohibits any of his teachers from going to be trained. He considers, with the Bishop of Cloyne, that the only escape out of the difficulty is the establishment of the denominational system.

197. Its establishment would, in the opinion of all, remove the remnants of those disqualifications on the score of religion which are visible in the partiality which is displayed in the treatment of Protestants and Catholics by the Board. I refer to the refusal of the Board to allow any further grants to schools taught by monks, and the regulation which debars nuns from receiving State aid, unless they reside on the spot where the school exists. This action appears to be arbitrary in the extreme, discourages the spread of education, and is resented by the mass of Catholics as an insult which through their religion is offered to themselves. But Protestants all the while are treated with the greatest favour.

Denominational system would place Catholics and Protestants on equality.

198. The contrast is very striking in Cork, where, while Dr. Webster is allowed by the National Board to have six National schools in the same court-yard, with an aggregate attendance of not more than 223 children, for whose education a staff of teachers are supplied at a cost of above £200 a year to the State, and a Presbyterian clergyman is allowed to open a new school without a question being asked as to its necessity (for which there is none), all aid is refused to the members of the Presentation Order, who, at a heavy cost, erected a school in one of the poorest neighbourhoods of the town capable of holding 700 children, and attended on the average by over 400, in the hope of being assisted, and also to the nuns who teach the new schools, on the north side of Cork, known by the name of St. Mary of the Rock, upon the erection of which £3,000 were expended, and in which more than 350 children are taught, on the average, every day. Such conduct only alienates from the Government of the country large and influential bodies of persons whose adherence and good-will it would be good policy to cultivate.

Not treated equally now.

Examples.

Alienates religion.

199. The Christian Brothers will never make any movement towards co-operating with the State in any educational movement as long as this spirit exists. They are an increasing and very influential body in Ireland, and are slowly, but surely, monopolizing the education of all the towns in the south of Ireland, and in their advance uproot the National schools. Within two years they have established themselves in two important

Christian Brothers increasing.

Established at Middleton and Mallow.

Will be at Queenstown.

provincial towns in Cork—Midleton and Mallow, in both of which the people gave up the free education of the National schools, and taxed themselves to be able to have their schools. At Midleton, besides raising £2,500 to erect the buildings, the inhabitants have engaged to pay £150 a year for the maintenance of the Brothers. The National school has disappeared, and the education of that district is now entirely in the hands of the Brothers and of the nuns who conduct the girls' school. At Queenstown, the National schools are doomed, and will exist only until the bishop's new church is built, when the Christian Brothers will take possession of the premises which now serve as a temporary church, but were erected with the view of receiving them. They now teach in Cork 1,610 boys daily, and are established in Youghal, Midleton, Mallow, Fermoy, and Mitchelstown, while wishes are already beginning to be expressed at Kinsale for their introduction there. The Roman Catholic Bishop of Cork, Dr. Delaney, said he would do all he could to plant them in every town in his diocese; and the Bishop of Cloyne said the same. They both urged the importance, as a matter of policy, of taking such steps as would lead to the establishment of some friendly relations between them and the Government of the country.

Bishops intend to introduce them everywhere; their co-operation with Government important; their influence great.

200. They are not inclined to be, I think, enemies; but seem to desire only a fair recognition of Irish rights, religious and political. Their influence must not be underrated, as it is apt to be by people who do not know Ireland well, or have seen little of the Christian Brothers. A few good men teaching large schools—such is the estimate that is likely to be formed off-hand of their influence. But the state of the case is very different, for it must be remembered that their schools are filled with the youth of nearly all classes of society, who, when they go into the world become important members of society, and carry away with them the feelings and thoughts they acquired at school, and, moreover, a feeling of affection and attachment for their former instructors, which is of unusual strength. Many have risen from the lowest ranks of society high up in the social scale through their schools, and the fabric of middle-class society is becoming in the towns of Ireland more and more composed of their scholars. Their existence cannot be destroyed, nor can their influence be counteracted, it would seem to be wise, therefore, to make warm friends of them rather than, at the most, luke-warm adherents.

Religious feeling and sense of right in favour of denominational system.

201. It will be gathered from my remarks that two feelings are operating in antagonism to the National Board and in favour of a denominational system—the feeling of religion, and the feel of right, both of which are irrepressible, even when acting apart, but when, as is the case in Ireland (I speak of that part of Ireland which I visited), they are united in their action, they are irresistible. For the people desire the union of religion with education, believing it to be in itself most important; and feeling so strongly its importance, they claim the application of the principle as a right, there being such religious unanimity among the vast majority of the people as renders its refusal arbitrary and meaningless. They point to the schools in which the prohibitive system of the Board is in full operation, and demand the reason of its existence. Whose interests are to be protected in them that interests and feelings of such magnitude should be so wholly neglected and needlessly slighted? It is impossible to argue in defence of the system on the grounds of its necessity, when such facts as I have stated exist. The legislation of the Board is meant to protect the particular creeds of those who differing as to religion resort to the same schools.

Circumstances in schools justify claim.

202. It would be wise and just if circumstances demanded it, but I deny the existence of such circumstances altogether. The fact of the presence of twenty-one Protestant children in schools containing 9,574 scholars cannot be considered a reason strong enough to justify withholding from 9,523 Catholics permission to combine their faith with their instruction in such ways as are most congenial to them. The interests of so small a minority can hardly, I think, be considered of sufficient importance to counterbalance the wishes of such a majority.

203. Or take the case of the city of Cork, again, where, in its National schools, 2,435 children were assembled on 25th June, 1868, of that number only three being of a different faith from the majority, yet the 2,432 Catholics were not permitted freedom in the exercise of their religion. I hardly think any body of Englishmen would tamely submit to such a restriction. It may seem to be a small and unimportant thing to contend for a crucifix or an image, or for the privilege of making the sign of the cross at all times with so much earnestness; but by those who contend, it is felt to be a battle for a principle, and for the vindication of what they consider to be their just rights. The Catholic clergy have, besides, lost all confidence in the National Board since, in addition to its deeds, the revelation has been made by Miss Whately of how the late Archbishop of Dublin regarded its establishment. They think they will be safe only in the possession of an unfettered denominational system, without which they will never be satisfied.

Opinions of Established clergy and laity.

204. I was careful to find out what the wishes of the Established clergy were, and I saw, or communicated with, as many of them as I could; of course, I called on the Bishop of Cork as soon as I arrived, and I take this opportunity of expressing my gratitude for the great courtesy and condescension with which his Lordship treated me. I had interviews with eleven of the clergy of his diocese, and saw a few members of the laity, among whom was Lord Bandon, and sent circulars to many whom it was impossible for me to see, but, I regret to say, received only two answers in all. My acquaintance, therefore, with the opinions and views of the laity is limited, although, I believe, much unanimity of feeling exists between them and the clergy, whose opinions, therefore, may be considered as representative of the views of the whole body of members of the Established Church. The Bishop regretted the isolation of their educational system from the National Board, and would willingly adopt any plan by which they might be brought into union with it, with, however, the liberty to use the Bible as freely as they do now. He thinks that this end can only be effected by the adoption of the denominational system, which experience has proved is the only plan by which all classes can be brought into State connexion as regards education. He thinks it is quite plain, and should be fully admitted, that the National Board has signally failed in its original object of assisting all classes on neutral ground. He is not astonished at its failure, as he knew that religious feeling was too strong and too deep in the Irish character to acquiesce tamely in such a system; but, since it has failed, he thinks that the authorities should now frame their regulations to meet the wants and wishes of the different religious bodies in the country. It would remove much of the dissatisfaction which is now felt by the members of the Established Church, who consider themselves aggrieved at being unable to benefit by the aid which the State gives to education, and which they are jealous should go exclusively to the Catholics and Presbyterians.

Protestant Bishop of Cork.

A Rector's view of denominationalism.

205. The introduction of the denominational system would not, indeed, be, according to the rector of a rural parish, all that could be wished, but would be better than the present state of things. I discovered that what he, with others of his clerical brethren, if they had their own way, would wish to see established, would be not a denominational in the sense of a separate system, but one which, while embracing all creeds, would render obligatory and necessary the daily reading of Scripture and its free use "for correction, for reproof, for instruction in righteousness," &c., in the schools of the country. To put it more plainly, the clergy of the Established Church would, according to him, wish to see a system of National Education established whose regulations as to religion should be framed on their peculiar principles and be the exponent of their own views.

206. Lord Bandon agrees with the Bishop of Cork heartily in desiring the denominational system, which, while leaving religion free, would enable the Protestant landlords to do more for the education of the people on their estates. He regretted, he said, that he was unable to do for the National schools on his property as much as he wished, but if he were to help them, his co-religionists would cry out against it as unfair to themselves, who are without State aid, and want all the help they can get. He thinks that much jealousy is caused by the Roman Catholics enjoying State aid, while the Protestants get nothing. Vested schools placed under neutral lay management, would be available for all classes of religionists in his opinion. Lord Bandon's opinion.

207. As I have said before, the strongest opponents of the denominational plan are the Presbyterian clergy. In the Appendix may be read two lengthy letters from the Presbyterian ministers in Cork. Their principal reasons for opposing the introduction of a denominational system are, the stirring up of religious animosities by it, and the consequent weakening of society which it would entail. They also object to it on the grounds that it would be an endowment of different denominations, and that proselytism would assuredly follow. They think that by such a system the influence of the clergy of all denominations would be excessive; and, above all, they think that it would be fatal to the integrity of the faith of their scattered brethren, who, unable to have schools of their own, would be driven for education to the Catholic schools, and would be absorbed eventually into the religion of the majority, but who under the present system could be safe. But here, again, it is demanding too much, to thwart the wishes of thousands because of a handful of people. As to the fears about proselytism, I believe them to be groundless. I do not think the clergy would take the trouble to proselytize, and I think that there is sufficient ground for confidence, as there is nothing in the attitude of the convent schools, which are unfettered by State regulations, and give full sway to the religious spirit, and possess many attractions which other schools have not, to lead us to suspect that they ever use their liberty and their influence to make proselytes. Much as I respect those gentlemen, I am constrained nevertheless to repeat my surprise at their inconsistency in establishing schools of their own, and non-vested, if they are such believers in the efficacy of a mixed system. The new Presbyterian school in Queen's-street, Cork, opened only last September, is, on any other than the denominational principle, needless,* extravagant, and inconsistent. It is near to the Model Schools, in which there is room for many more than it contains; and in the Model Schools these children would be as well taught, and have the great advantage (for such it is in the eyes of the clergymen to whom I am alluding) of associating in "friendly worship" with others. Its existence is not an evidence of its founders' love for a mixed system. Opinions of Presbyterian clergy.

208. Those clergymen of the Established Church who dissent from their brethren with respect to this question base their objections to a change from the present system to a religious one, on the same grounds precisely as the Presbyterians. Dr. Webster dreads the bitterness which proselytism would cause, and he sees no other result from a change than an active development of that spirit. He believes that education will deteriorate, and that the books will be lowered in time, by being brought down to a sectarian level. The Catholics will use their books to defame their opponents, who, on their side, will not be slow to frame their books with the view of demolishing popery. I hope and believe, however, that a wiser and better spirit now prevails in Ireland. In England, where denominational schools exist, I am not aware that such evils exist. I have acted as an inspector of schools for eighteen months, and have had an extensive acquaintance with Roman Catholic schools during that time, but cannot recall to mind any case in which the liberty afforded them so generously by the State was ever abused. I cannot think that Ireland will fall below England in the possession of the same freedom of education. Opinions of Established clergy opposed to denominational system.

209. In the course of the above remarks on mixed education, I have endeavoured simply to put myself in the position of those whose opinions I have been endeavouring to give, and must not be understood to have in any way expressed my own mind on the abstract merits or demerits of the "denominational system." It would be out of my province altogether to do so; and I am not, besides, blind to the difficulties which beset the question on every side. But, notwithstanding, there are occasions and circumstances in which the mere abstract view of a case must give way before an actual necessity for a line of action in a particular direction. I am deeply conscious that such an occasion is present, and that such circumstances exist at this moment in Ireland. The strong feeling of a people brings into action very frequently the principle of expediency. May it not happen that expediency will now hasten the adoption of such educational measures as the Irish most desire?

Teachers.

210. I propose to notice, first, the proportion of teachers, as an average, to the average attendance in the different descriptions of schools visited, commencing with the National. The National schools, owing to their support by the State, and their low salaries, which render their employment less expensive, are well supplied with teachers. Their number, indeed, compared with the daily average attendance of children, would induce one to expect a more thorough educational efficiency in all the classes of their schools. The following figures will give some notion of the proportion of children in average attendance to each principal teacher and assistants, and to principal teacher, assistants, and monitors. Teaching Staff in National Schools.

211. In 48 National schools, with an average attendance of 3,544·6 children, I found 48 principal teachers, 38 assistants, and 34 monitors, which gives an average of 73·4 to every principal teacher, 41·1 to a principal teacher and assistant, and 28·5 to each principal teacher, assistant, and monitor, or in other words, each of these 48 schools had an average daily attendance of, in round numbers, 74 children, who are provided with 3 teachers. Proportion of children to teachers.

212. It may be interesting to compare these results with the schools taught by "religious." They are left, as to the number of their teachers, altogether to themselves, and the will of the superior, or the circumstances of the community as to numbers, determines the number of teachers. But as all these schools are in connexion with houses whose inmates are more or less numerous, the number of principal teachers may be considered adequate. I speak, of course, chiefly of nuns, there being only two schools taught by monks in my district. The following facts will convey the conclusions at which I arrived. I visited 6 convent schools, attended, on their average, by 2,293 girls, in which there were 63 nuns regularly employed in teaching, assisted by 73 monitresses, giving an average of 36·3 children to each nun, and for each monitress an average of 31·4, or for each teacher at all 23·1, a result which proves that the convents are not under officered, and that if the magnitude of their results bears no proportion to the magnitude of the machinery in operation, the fault is to be attributed to a waste rather than to a want of power. Teaching staff in convent schools.

213. The only schools taught by men living in religious communities are the Lancasterian and the Douglas-street or South Monastery school (as it is called), which have an average of 751 children in daily attendance, Monastic Schools.

* Not even on the denominational system can it be redeemed from the charge of needlessness.

for whose instruction 11 monks are employed, giving an average of 68·2 boys to each teacher; with 10 monitors employed, we have an average of 75·1 to each monitor, and combining monks and monitors, we have one teacher for every 35·7 scholars. This is very much higher than the average in the convent schools. But the number of "religious men" is much less than that of the women. The larger proportion of monitors in the convent schools is not so easily explained, but I believe it is owing to the encouragement given by the Inspectors to their employment in the convents out of some chivalrous (perhaps) feeling of consideration for the shabby remuneration which the nuns receive from the Board.

Christian Brothers.

214. As I am on the subject of monastic and convent schools in connexion with the Board I may as well here briefly notice the teaching staff of the Christian Brothers and the convent schools that are not aided by public grants. There are three Christian Brothers' schools in Cork, with an average attendance of 1,610 scholars, for whose instruction they supply nineteen teachers, and 161 monitors, which allows one master for every 84·7 scholars, and including the monitors, 8·9 to each teacher. Their supposed allowance is one master to every hundred boys, but this being insufficient, they supplement by appointing numerous monitors, who do the actual teaching, under the superintendence of the Brothers in charge of the different rooms, but these monitors are too inefficient to be included in the teaching staff.

Convent schools.

215. In three convent schools not connected with the Board, I found an average of 1,209 girls under fourteen teachers and thirty-nine monitresses, giving an average of 86·3 girls to each nun, and including monitors, an average of usually 22·8 scholars.

Church Education.

216. In eighteen schools of the Church Education Society, attended daily on the average by 393 children, there were 18 teachers employed, giving an average of 21·8 to each teacher. Monitors are so rarely found that it is useless to include them in this estimate.

Grades of National teachers.

217. The National teacher, after passing a preliminary examination, is allowed to take charge of a school in the capacity of a probationer, that is, he is allowed for a time to occupy the post of a qualified teacher, during which he is supposed to prepare himself for the examination which he must pass to become qualified for permanent employment. He is then called up and examined, and classed according to his merit, or rejected if unfit. This classification is his first foothold on the ladder, up which, by a succession of similar but sharper ordeals, he may now hope to advance to the summit of his profession. First to gain a grade, and then go higher is the teacher's aim. It is peculiarly his interest to do this, since upon it, and not upon length or excellence of service does his advancement depend. It would be thought, in consequence of this, that the majority of teachers would attain at least to a middle rank. But this is not the case, at least so far as the information I have been able to collect goes. For out of twenty-nine National schoolmasters whom I saw, thirteen were in the third class, one of that number being in its lowest division.

Men.

Majority in 3rd class.

Distribution of minority.

218. The remainder were distributed as follows:—Four were in the first division of the second class, and three in the second division of the same class. In the first division of the first class there were four teachers, in the second three, and in the third one; thus while having 27·6 per cent. of the masters in the highest class, and 20·6 in the second class, we have 51·6 in the lowest class of all.

Mistresses.

219. The female teachers stand, as regards the preponderance of numbers in the lowest grades, in the same position. Out of twenty whom I saw, eleven were in the lowest class, five (three in the first, and two in the second divisions) were in the second class, and four were in the highest class, one being in the first division, two in the second, and one in the third. The following per-centages express the relative proportions of these classes. In the third class 55 per cent., in the second class 25 per cent., and in the first class 25.

The low grade of teachers remarkable.

220. Others may be struck, as I was, with this preponderance of teachers in the third class; for why should it be so, seeing the door is thrown open to all to advance, with the double inducement of increased pay and improved position? And besides, the intelligence possessed by these teachers is considerable, and the knowledge required not so great but that it might be acquired by moderate perseverance and study.

Causes, (1) early marriages.

221. One reason appears to me to be the habit which prevails among the Irish of marrying early. The greater number of the male teachers I met were married, and had married young—comparatively young themselves, many were fathers of grown-up children. They assume the responsibilities of married life just when their resources are slenderest. A young man, with £24 a year, and a wife and young children, has to look alive to keep want outside his door; and he must be ready to do all he can in his leisure time to earn something beyond his official pay. Either he takes to private tuition, or to cultivating his potato field, and either alternative is fatal to study, which, unless he neglects his school, must be done out of school hours.

(2) Local employment.

222. Then again, in the country districts, where the farmers' sons are numerous and ill-provided for, it is not, I believe, uncommon (I saw two instances myself) to combine teaching and farming. The son of a farmer near to a school who is sharp enough to pass the required examination and has not enough to employ him at home all day becomes a teacher; he thus brings in a comfortable yearly sum to add to the family stock, and contributes, in the evening and in the early morning, his share of manual labour to the farm. When this is the case, the young man has no ambition to shine as a distinguished member of the body of teachers. At Couscroneen National school, in Myross parish, the teacher of the boys' school told me he was a farmer's son, whose farm was about two miles away, and that he helped his father before and after the daily opening and closing of his school. At Shirkin Island there was a very similar case.

(3) Regulations of Board.

223. Another reason of this depression is owing, without doubt, to the application of that regulation of the Board which precludes a teacher from promotion, if, although otherwise qualified, the average attendance of his school has fallen, or if the children fail to satisfy the Inspector on his visit to the school preceding the oral examination of the teacher. The Board does not make, apparently, any exception for cases in which the district may be very scattered, or the children very poor, or the weather unusually bad, or the attraction of another school, to which the Irish poor are very susceptible, too great for the average attendance to keep up to the required minimum. One of the marks of a good teacher appears to be, in the eyes of the Board, his power of keeping up a good average; and as this average is a thing visible only in ink and on paper, a wide margin is left open for the exercise of the teacher's skill, if he is dishonest, in fabricating the required figures.

224. At Baltimore, the now ruined but once flourishing place from which the American city takes its name, I visited the National school, and succeeded in seeing the teacher, a man broken in health and spirits, and getting past middle life, married, and the father of eight or nine children. Upon learning his grade, which was the first division of the third class, I expressed my surprise at his not being higher up. "Well, sir," he said, "you see the people are very poor, and their children attend very irregularly, and when the Inspector came either the average was too low, or the scholars failed to do well, and I lost my chance." All these reasons are worth, I think, consideration, as explanatory of the low classification of the male teachers in my district.

Low grade of female teachers.

225. I have noticed above the similarly low grade of the female teachers. This did not surprise me. Promotion depending principally on intellectual advancement, it was not surprising that women of their class were so low down. It is not of so much importance to them as to men to get on, for theirs is a life in which

advancement is identified with anothers. The life of the female teacher is a combination of domestic and scholastic duties. Her wants are fewer than a man's. She is a wife, or a daughter, or a sister, and in those relationships she finds occupation and support, and need not exert herself to get more than she has. Cause.

226. But are these teachers less useful than others of higher standing? Are they less efficient instructors? As regards men, it cannot be denied that the teachers of the first class are superior, individually, to those of lower grades. But I do not think that personal superiority affects the condition of the schools taught by the different classes of masters to any great extent. I believe that, on the whole, making due allowance for surrounding circumstances, the teachers of the highest grades are not so much more efficient as they are thought to be. As to the moral superiority which I looked for in the schools which had the advantage of teachers of the highest grade, I could see no difference between them and others which had not the same advantage. There was the same absence of habits, of order, and self-restraint; the same presence of unchecked copying and prompting; the same whispering and talking; the same uncontrolled deportment; in short, all the indications of the absence of that influence which is called moral. Relative efficiency of different grades fairly equal.

227. Female teachers differ very greatly in efficiency, but their variations have no relation whatever to their classification. I found the best instructed school taught by a mistress who ranked only in the third class. It was the Castlemartyr female school. By referring to the tables,—pp. 140–144, in which I have given the results of my examination of the different classes of schools, comparison can at once be made between it and the Sundayswell female school, Cork, taught by a mistress of the first class, or, the Midleton Poor Law Female National School, taught by a mistress of the second class. I have no doubt as to which of the schools would come out best.

228. The number of teachers in the first class in my district is proportionately large. I found eight, and I knew of at least three others in different neighbourhoods. It is, I believe, very unusual to find so many in such close proximity; but the district has many small towns or large villages, surrounded, to the north and to the south and east of Cork, by good agricultural populations, whose children require higher instruction sometimes, and pay higher fees for it; and opportunities, too, occur of private tuition, by which some addition is made to their salaries. In the city of Cork itself there are, excluding the Model school, only two masters of this grade, who really teach middle class schools, and are well paid. In the ordinary National boys' schools of the city there are no masters of so high a grade. There is not much field now for a first-class man, owing to the absorption of the better classes into the Christian Brothers' and Presentation Monks' schools. I found only one first class man in a purely rural school, but he had a farm. In every country town, except Kinsale, I found first class teachers. First Class teachers numerous. Number in Cork. Found chiefly in towns.

229. I expected to find a more general dissatisfaction with the present principle on which teachers are advanced to the upper grades, but very few indeed had even thought of the matter as a grievance. Some would have the working of the system modified. Thus, one teacher suggested the advisability of abolishing the plan of requiring an oral besides the written examination. Another would have (and this is one of the very few instances in which I found the whole principle of the classification of teachers attacked) advancement to a class depend upon good service after proving at the outset fitness to teach by passing a successful examination. The teacher of the St. Nicholas, No. 1, Boys' school told me that he had the necessary number of good reports, and had been put off through an illness happening accidentally to interfere with his passing the oral examination. Feelings of teachers on method of advancement.

230. A feeling, too, exists that the Inspectors have too much power, and that their reports, upon which advancement depends, are made unfavourably, owing to some trifle which ought not in fairness to be allowed to count against them. The teacher of the Cove (Queenstown), No. 1 school, told me that the former Head Inspector of that district came to inspect his school, and found a few Sequel Books still remaining in use in that class, as was allowed within a limited time, which had not then quite expired. These books, the teacher said, put him out, and he threatened a bad report for inefficiency in the management of the school, which he said, would operate against his advancement. I mention this without at all giving an opinion as to the right or wrong of the individual's case, but merely to illustrate the feeling that exists in the minds of some of the National teachers with respect to the present system of classification. Think Inspectors have too much power.

231. My own feeling, if I may be allowed to express it, respecting the matter is, that advancement of grade, with its accompanying increase of pay, is made too much dependent on literary capacity, and too little on good service. I am unable to see what peculiar right a teacher has acquired to be raised in position simply because he has proved himself to be a good scholar, when another man, equal to him in the discharge of his duties, is unable to advance. The teacher's office is one which requires the devotion of all his energy for the efficient discharge of its duties, and leaves little time for such repeated efforts as have to be made in order to rise in the present system. A man, before he is permitted to teach, should prove himself fit to undertake charge of a school by passing an examination. His examinations should cease when he commences his work, and his advancement proceed in proportion to his subsequent merit. Besides, a good mathematician is not necessarily a good teacher, nor is there any special power to instruct youth efficiently imparted with the knowledge of natural philosophy. A third class man may be quite as able a teacher as a first class man, and his services should be recognised and rewarded, and not passed over because he is unable to stand the test of an examination, which really has no effect upon his work, taken as a whole. It must be borne in mind, as far as my experience goes, that the bulk of the children under the first class men are not better taught, as a rule, than those under men of inferior grade. There may be a few boys who are benefited by the superior instruction of the highest teachers, but they are very few, and indeed higher instruction is not confined to these schools, but is found where men no higher than the third class preside. Advancement should go with good service.

232. It may not be unnecessary to add that the majority of the teachers, who are in charge of schools, are persons who have had a previous training as assistant teachers. In the case of very small schools, which do not offer any local inducements of good school fees, or the chances of private tuition, or society, and the like, it is not unusual to find young men in charge of them who have never known any more of school-keeping than what they learnt as scholars or as monitors. Such schools are to be found only in very remote parts of the country, and are inferior, as might be expected. Managers, in employing teachers, are not of course unmindful of the advantage there is in having a person of experience at the head of a large school. Principal teachers generally experienced.

233. The National teachers being classed, the Church Education Society was determined that the teachers of their schools should not be without some distinction. And so I found that they were, with one exception, classed according to their proficiency as tested by examination. Their classification is made not necessarily when they leave the training school, but may take place subsequently. Indeed, they are called up and examined, as a regular practice, after they have been in charge of schools. Church Education Society's teachers classed.

234. The question of training being one of great importance, was carefully gone into. The following facts will convey the results of my inquiries. They will show that the number of trained teachers is in excess of those that are untrained by a very considerable proportion; and they will at the same time show that the Training.

Trained principal teachers exceed untrained.

assistant teachers are untrained without exception. Of twenty-nine masters in charge of schools, nineteen were trained and ten were not, giving a proportion of nearly two trained teachers to one untrained. Among female teachers there is not the same excess of trained mistresses, there being in twenty as many as nine untrained teachers. Combining males and females, we have, of forty-nine teachers, thirty that were trained and nineteen not trained, the number of the trained teachers being nearly double that of the untrained.

With assistants untrained teachers predominate.

235. But it must be borne in mind that these facts do not represent by any means the state of things in the whole class of teachers, since they concern only the principals in charge of schools, and do not include the assistants, who, being all untrained, if they were included in the calculation, would turn the scales in the opposite direction, and place the trained teachers in a minority, which will appear from these facts. The ordinary National schools that I visited have thirty-eight assistants engaged in teaching, of whom twenty-three are males and fifteen are females, none of them being trained. Now, if this number of untrained assistants be added to the nineteen untrained principal teachers, instead of having the trained teachers exceeding the untrained in the proportion of nearly two to one, we shall have the untrained (amounting to fifty-seven as against thirty) in excess of the trained in the proportion of very nearly two to one.

Causes.

236. The question then arises, why the principal teachers are for the most part trained, and the assistants not so. It may partly arise from the youth and short service of the latter class, as teachers in Ireland are employed some time (except in rare cases) in exercising their office before they are called up to be trained. But this is not an adequate explanation, since very many of these persons have exceeded the time that usually

(1.) Youth and short service of latter class.

elapses between first taking service under the Board and being called up to Dublin for training. I discovered this by referring to the history of the principal teachers, which showed me that the average period that elapsed between their first appointment and their training was less than the time that had elapsed between the appointment of the majority of the assistant teachers and the period of my visit. Nor can unwillingness to be trained be alleged as a reason. The teachers, on the contrary, are most anxious to be trained, as they feel that they

(2.) Training prohibited by clergy.

would thus be able better to compete with the trained teachers for employment. The real reason is the unqualified prohibition put by the clergy upon going to the training schools, constituted as they now are. The employment of trained teachers by the same authorities who refuse to allow untrained teachers to enter the training schools is only apparently inconsistent, for those individuals who have been trained, and are sought after by the managers of National schools, were trained when as yet there was no prohibition, and when all were free to go. And "where there is no law there is no sin," is the principle on which the Catholic clergy go, as regards employing trained teachers. But a law having been passed, its ministers are ever on the alert to ensure obedience to it, and any infraction of it is treated with unbending severity. All those of the Catholic priesthood with whom I came in contact, without an exception, told me that no man or woman who had been to the training schools could hope for employment.

237. The Bishop of Cloyne told me it was vain to look for employment in his diocese under such circumstances. The Bishop of Cork expressed the same sentiment, as did also the Bishop of Ross, who further added that he considered the Model schools in Dublin destructive of the morality of youth; and for that, if for no other reason, he would never sanction the training of teachers from his diocese. An old and venerable priest in Cork, told me, with great earnestness, that he would do all in his power to prevent the employment elsewhere in Ireland of any person who went from his parish to the training schools.

Training desired by most teachers.

238. The teachers themselves desire training, but dare not go for fear of losing employment. The mistress of the St. Patrick's National school told me that she would like to be trained, but was forbidden. The master of the Blackpool school in Cork said that he had been summoned four times, but was ordered not to go by his manager. The mistress of SS. Peter and Paul infant school expressed her desire to go to the training school, but said she was sure she would lose her place. Cases have occurred in which young men have disobeyed the injunction (though very rarely), and have found that the clergy were thoroughly in earnest by the loss of place that ensued. As I was going through the Model school in Dublin with a friend, he stopped and pointed out to me a young man who was employed in one of the rooms through which we passed as one of those who, in consequence of obeying the summons to go to Dublin to be trained, had lost his place. I learn that he had been employed at Scartlea, near Aghada, as principal teacher in the school there, and informed the manager that he wished to go up to Dublin to be trained. He was told by Mr. S——, the manager, that if he carried out his intention he would lose his school. He, nevertheless, went to Dublin, was trained, and returned in the hope of getting back his place, but found it filled by a person who had been engaged permanently during his absence. He was then thrown on his own resources, and being a worthy man with the extra recommendation in the eyes of the Board of enduring much for training's sake he was immediately re-admitted for the special class. I give the substance of the story as he told it to me. I heard of another case in which a young man just returned from Dublin went in search of work, and succeeded at length, after many refusals, in getting a junior assistant's place through the kindness of the head teacher who had the appointment in his hands, but concealed the fact of his being trained from the manager.

Training desired by managers as well, but on religious basis.

239. But the managers as well as the teachers regret this dead-lock, and desire its removal by such changes as will secure the combination of religious with secular teaching in the training schools. It may not be inopportune here to make a few remarks on the subject of training in Ireland, with reference to the necessity there is for making some alteration in the present system. The teachers are anxious to be trained, and very naturally, as it is a recommendation which gives them a higher value in the field of competition for employ-

Advantages of present system.

ment, and, moreover, places within their reach, during the four and a half months which are spent, on the average, in Dublin, many precious opportunities of enlarging their minds by intercourse with others better informed than themselves, and of improving their manners by associating with others of superior culture. It gives them, in addition, some time for well-directed (let us hope) study, and for observing different methods of teaching, which, if they are intelligent, may be of service to them when they return to their schools.

240. But these advantages fall very far short of real training. They are, indeed, better than nothing, but the time allowed for training is too short for the fullest benefit to be derived from them. The real fallacy of

Its imperfections.

the system lies in commencing the work of training after a young man or woman has been allowed for three years or more to be occupied in teaching, and may be supposed during that time to have acquired fixed habits and modes of action. Duties of importance are discharged for a long time, frequently during a whole school generation, by a teacher before he is called upon to learn how to perform them. He is allowed to experimentalize, and theorize, and blunder, before he is taught how to act upon systematic principles. Besides this, he is, after being considered sufficiently intelligent to conduct a school, liable to be refused admission into an institution which was founded for the purpose of improving the teacher, on the ground of insufficient intelligence; and although thus condemned, he is nevertheless remanded to his post, without a chance being given him of improving his intelligence at all.

241. Then again, how fallacious it is to call that training which occupies only a period of four and a half

months; for, excepting those who are called up for the special class, that is the whole amount of time allotted to training. It is a difficult matter to take unformed minds, and mould them; but it is still more difficult to affect the intellectual bias of those whose minds are already formed. It is next to impossible to give a man a real knowledge of any subject in four and a half months; but it is quite impossible to teach a man a subject which includes a moral education as well as an intellectual one. For training, to my mind, is chiefly valuable in its moral aspect, using the word moral in its largest sense. All the ideas we acquire need time to become assimilated and form part of our minds; and those of a moral character are not exceptions to this rule, but require even more time to become strong motive powers within us. If this be so, I am unable to perceive how the originators of the National system arrived at the conclusion that a residence of four and a half months in a training school could be sufficient to make a teacher thoroughly efficient.

Class from which National teachers come.

242. The National teachers may be said, as a rule, to have sprung from the lower classes, either from the small shopkeepers or tradesman's class in the towns, or from the peasant, farmer, or agricultural labourer's class in the country. They are all of them the creation of the National system; from it they got the education which, in its service, they impart to the younger generation.

Salaries; their sources.

243. The sources from which the National teacher derives his income are the National Board, local contributions in the shape of school-pence or endowments, the sale of books, and here and there extra sums under the names of "good service allowance," "gratuities for cleanliness and good order," and for "training monitors." The bulk of this salary comes, however, from the public purse, the next largest amount being derived from school-fees, and a fraction from the sale of books, &c. I have mentioned endowments, but indeed, with one exception—the mistress of Sundayswell girls' school, in Cork—I do not know of any Catholic teacher receiving anything from endowments. Of the schools in connexion with the National Board, but belonging to the Established Church, I found six (the different departments that go to make up St. Nicholas' school, Cork) in which the teachers derived yearly sums from endowments. The sums derived from selling books are very trivial and are hardly worth being included in this estimate. From all these sources combined the National schoolmaster in the district I visited may be supposed to receive an average income of £49 5*s*. 4½*d*., of which £31 10*s*. 1*d*. comes from the Board, £16 15*s*. 3½*d*. from school fees, and the remaining £1 from the sale of books, &c. The difference between the fixed salary of £31 10*s*. 1*d*. and the total salary of £49 15*s*. 4½*d*. expresses the average amount by which the salaries of male teachers are increased.

Average amounts, masters.

Mistresses.

244. From similar sources the female teachers derive an annual average income of £44 5*s*., of which £26 5*s*. 1½*d*. are paid by the nation, and £17 5*s*. 3½*d*. are derived from school-fees, the sale of books, good service allowance, gratuities for training monitors, &c.

These average salaries.

245. Small as are these average salaries respectively, they, nevertheless, exceed the average salary for the whole of Ireland, which is, roughly speaking, not more than £30 per annum, and exceed considerably the average salary of the majority of the principal teachers of the district I visited, who, being in the lowest class, would not have more than £32, respectively, from all sources. They exaggerate the average salaries of the teachers throughout the country, as they are calculated from statistics derived only from the schools actually visited, which, while not including the bulk of the schools, include certain schools in the city of Cork and the surrounding country towns taught by masters of the highest classification, whose average salaries exceeds the general average by £34 13*s*. 3½*d*. In Queenstown, in Cloyne, in Skibbereen, in Bandon, and in Cork and the country surrounding it, the best paid masters are found. Their salaries average from £72 to £122 a year. The mistresses of high grade are fewer in number, owing to the convent schools having occupied their places in the towns. It was only in Cork that I found female teachers of this class. Their salaries (I exclude always the Model schools) range from £60 to £80 a year. Male teachers of the second class receive salaries ranging from £34 to £60, and females from £27 to £45 a year. The salary of third class teachers range from £24 to £34 a year for men, and for women from £18 to £26 a year. The National Board grants an increase of pay in the shape of what are called good service allowances, paid upon a scale adjusted to the class of the teacher. But although the scale contemplates the extension of the allowance to the different classes of teachers, practically none benefit by it but those in the first class. I found only one teacher out of that grade receiving the allowance for good service. This creates much discontent among the teachers, as it looks like a practical refusal to reward long and good service. A small allowance made yearly to teachers of a certain length of good service would be a valuable addition to their pay, and would be very thankfully received as a proof of the recognition and appreciation of faithful service.

Salaries of different grades.

Good service allowance.

246. Besides good service allowance, certain premiums granted for cleanliness, gratuities for training monitors, for singing and drawing, and profits derived from the sale of books, go to increase the salaries of the masters and mistresses; but the total amount derived from these items is so small that the average payment does not amount on the whole to more than £1. The monitors in the ordinary National schools being few, the sums arising from their training amounts to very little. Two or three schools only are taught music and drawing, and the amount, therefore, for them is very trifling indeed, as are the amounts derived from premiums, &c. The profit made by the sale of books is so small that it amounts, on the average, to no more than 13*s*. 3*d*. a year, the majority of schools making much less than that amount.

Average salary does not represent a net sum.

247. Such are the means by which the salaries of teachers are increased, and I have shown how slight is the addition they make. But the average salary does not represent a net sum. It is calculated independently of the deductions for rent, for the supply of fuel in the winter, and sometimes for the purchase of apparatus, in the shape of maps, &c., to which every teacher's yearly stipend is liable.

No houses, as a rule, provided for.

248. No National teachers are supplied with houseroom; none, at least, of schools under Roman Catholic management, with the exception of two: the master of the Ballymartle National school, and the mistress of the girls' school at Cloyne. The teachers of schools in connexion with the Established Church are more frequently supplied with houseroom. I came across four who were thus supplied.

Cost of rent on the average.

249. The average cost of rent amounts to £7 per annum, some teachers in Cork paid more, and some in the purely rural districts less; but in no case exceeding £20 per annum, or falling below £2 10*s*. These rates of payment will convey some idea of the kinds of houses occupied by National teachers. I should be glad to approach to some estimate of the sums paid by teachers out of their own pockets for coal, for occasional repairs, and sometimes for apparatus, but I am unable. The statements made to me by the teachers were so loose and vague that I could not gather sufficient data from which to deduce a law. I must, therefore, content myself by giving a few particular instances.

Examples of expenses which fall upon teachers.

250. The first note book I take up gives me the following facts. In the Blackpool National school, Cork, the master has a salary amounting to £43 2*s*., out of this his rent for the year 1867, £7 16*s*., had to be deducted, and the following minor sums:—15*s*. a year for coals (for which though the pupils subscribe small sums, he is responsible), glazing 13*s*., brushes for cleaning 5*s*., share of subscription got up amongst the teachers to defray the cost of new maps 5*s*., tablets 3*s*. 9*d*., making a total sum of £2 1*s*. 9*d*., to which, if the amount for rent

£7 16*s.* be added, and the sum £10 17*s.* 9*d.* be subtracted from his gross salary (£42 3*s.*), the net income of this man would be no more than £31 5*s.* 3*d.*, out of which he would have to feed and clothe himself and his family.

251. The teacher of the boys' school at Passage West told me that he frequently put in windows at his own cost, not wishing to trouble the manager, and showed me a large map which he had bought for the school, but gave me no figures. At Clogheen village school the teacher says small expenses, such as glazing, whitewashing, &c., fall on him, as he is unwilling to trouble the manager, who is responsible nevertheless, and would willingly pay if applied to. He named 2*s.* as the sum it had cost him to have windows put in in 1867. He supplies pens and ink, and occasionally books. I saw a boy in the school who had taken a Fourth Book on credit from him, and steadily refused to pay for it. House rent cost him £3 per annum, and his salary was £34.

252. The teacher of Sundayswell National school informed me that he had to pay almost the whole cost of the coals used in the winter preceding my visit—but he gave me no figures. His salary is, on the average, about £52 from all sources, and his rent £7. I may mention here that he is married to the mistress of a National school in the country about twenty miles from Cork, and goes home every Saturday, for which he told me he had to pay car hire, a weighty item of expense to him. In one or two cases, I met with complaints from the teachers of being obliged to give requisites of books, &c., to pupils who refuse to buy them, or take them upon credit and never pay for them. The teachers are afraid (it seems to me) to refuse them, as the children would leave, and thus lower the average attendance, and endanger their salaries.

Sale of books. Teachers not benefited by it.

253. The sale of books requires a notice here. The present regulation which makes the teachers responsible for a full supply of books, acts detrimentally to their salary. The teacher gets a supply of requisites for which he has to pay ready money, though at the large discount of 25 per cent., but owing to the unwillingness of the children to buy at all, or to their unwillingness to pay when they do buy, he remains out of his money while the books remain unsold, as they do frequently for months together, or loses it entirely by the credit system to which, for the reasons given above, or through good nature, he is driven. And, at any rate, the amounts come in in such driblets that they are not felt, while the sum which had to be paid in cash for requisites was large enough to be felt severely. This is particularly the case in small schools, where the books are more frequently given than sold. Let us take the case of a man who has no more than £30 a year, and who is discovered by the Inspector to have a deficient supply of requisites. According to the Board's regulations, its officer is obliged then and there to write an order for whatever amount of books he may deem necessary, which are sent down from Dublin to the nearest Model School, the amount being deducted from the man's salary, who is thus not only obliged to submit to the deduction from his salary, but has to wait, as I have said, for months before he gets back his money at all, the length of time he has to wait not being compensated by the 25 per cent. discount which is regarded as his profit. An Inspector told me, as we discussed this matter, that he would very much rather give a man the necessary money out of his own pocket than put the regulation in force in the majority of cases, so severely would it be felt.

Assistants' salaries

254. The average salary of the assistants amounts to no more than £26 per annum for males, and £20 per annum for females. They receive nothing beyond this, since all the extra receipts of the schools go into the principal teachers' pockets. I found only one exception to this rule; it was at Queenstown, where the manager requires the master of the upper school (No. 1, as it is called) to pay £4 a year out of the school fees to each of the assistants, he adding £8 a year besides. These two young men were the only assistants who received anything beyond their salaries. It would be impossible for them to live on this pittance did they not live with their parents, as several do, or receive help from them when away from home, or by private tuition make small and fluctuating amounts by which they eke out their salaries.

Extraneous employment of teachers.

Private tuition.

255. This brings me to the subject of the extraneous employment in which all the male teachers under the Board are more or less engaged in order to support themselves respectably, or to live at all. The staple of this kind of occupation is private tuition, either at home, or in evening schools. Young men who want to acquire a knowledge of arithmetic or book-keeping to fit them for commercial work, or to compete for Government appointments, have resort to the National teachers, who are less expensive than others, and probably not less efficient. This work is done of course in the evening and on Saturdays. I met a man who made sometimes £10 a year by surveying land, and regularly employed his leisure time in giving lessons in navigation to the captains of merchant vessels preparing to pass the examination of the Board of Trade, and in other branches of mathematics. The teacher of the Clogheen school above alluded to was engaged for nine months just before my visit in teaching the children of a gentleman in the neighbourhood, for which he received £15 a year. All the masters in Cork were engaged in this kind of work, but they all concurred in saying that the uncertainty of the occupation made its remuneration too fluctuating to be counted on as a fixed item of salary. It is not very uncommon, I was informed, to find the National teacher acting as postmaster in out-of-the-way places. I came upon one such instance at Belgooley, a small village near Kinsale, where the teacher of the school is postmaster and receives about £3 a year for his trouble. And at the Cove of Kinsale, I was informed by the young teacher of the school there, that his predecessor had been postmaster for years previous to his death. An ingenious man may employ himself in miscellaneous ways, and thus increase his income, like the teacher of the Enniskean school, who makes something by mending the clocks and watches of the neighbourhood.

National teachers postmasters.

In National Schools of Established Church, masters act as clerks and sextons.

256. In the National schools in connexion with the Established Church, the teachers are generally engaged to act as clerks or sextons, which increases their salaries considerably. Thus the master of the Ballintemple National school, while receiving £24 from the Board, has, in addition, £10 a year as clerk, and a house free, with £8 a year from the managers, and an allowance of £3 a year for coals. He was the best paid third class man I met with, his net salary amounting to £49 a year.

Teachers not much benefited by such occupations.

257. From all that I could gather, these irregular occupations did not seem to bring much increase to the salaries of the teachers. They would not of course make any reliable returns by which I might have been able to judge of the extent to which they were affected by them. But, anyhow, the question of the sufficiency or insufficiency of the present rates of payment to meet the demands of life among the teachers, and to enable them, besides, to maintain their positions in such a manner as would increase the respect of the people for their office, is not affected by the fact that they are able to earn something extra by work done out of hours. To my mind it is questionable whether it is a good thing for a teacher to be obliged to continue work beyond official hours. But however that may be, the real question is simply this, are the National teachers of Ireland adequately remunerated for the services they render the country in educating its youth? Do they receive an equivalent for what they do? This is felt by them to be the real point, and they are all concurrent in the opinion that their present salaries are wholly insufficient, in many cases, to meet even the bare necessaries of life, and to enable them to maintain becoming and respectable appearances. They say that the present scale of payments was fixed when living was much cheaper than it is now, and was more in harmony with the circumstances of the country generally. When the National system came first into existence, labour was less valuable than it is; mechanics were less well paid; and agricultural labourers did not receive such large wages. And in

Salaries thought insufficient by teachers.

keeping with that state of things, the necessaries of life were cheaper; the potato had not failed; the exports of the country were not so numerous; and steam communication, which stimulated the export trade, had not raised prices in Ireland to the level of the English markets. Their salaries were then, they say, more in keeping with surrounding circumstances. But now that circumstances have changed, no alteration has been made in their case, and the salaries which were considered sufficient to meet the demands of existence thirty years ago have now to bear a doubled expenditure.

Teacher's position and influence lowered.

258. The present rates of payment not only depress the teacher's life; they also affect his position, by putting him in unfavourable contrast with mechanics, the Constabulary, and even with agricultural labourers. The majority of the teachers receive salaries inferior to those of the Constabulary, and in the case of assistant teachers, not exceeding those of well paid farm servants. A parish priest, writing to me, says on this head, that the payment of an assistant in his parish is not much more than that of the class I have above mentioned. The disproportion between the remuneration of the National teachers and others less well educated, tends to bring them into contempt. They are looked upon as men who can do nothing else, and so are obliged to be content with inferior wages. One teacher told me that he was subject to much annoyance by the jeering tone of the young men of his village about his miserable pay. Then again, their poverty keeps them down in habits, in manners, and in thought, to the level of those who surround them, and to whom they ought to be superior, if their influence is to be of the best kind. No intelligent observer can enter the majority of the National schools without feeling that the highest influence is wanting.

Poverty keeps them on level with people.

Remuneration should be more proportionate to value of work.

259. There is absent in the teachers the circumstances of good manners and proper dress, which go a great way towards civilizing children. He is in all these respects on a level with his scholars. How can he be otherwise when his pay is barely sufficient to keep himself and his family supplied with simple necessaries? They feel all this very keenly. There is, too, a feeling prevalent among them, that remuneration ought not be awarded merely in relation to the possibility or not of living on a certain sum, but should be regulated according to the value of the work itself. They consider it only fair that the same principle should be admitted in their case, as in the case of those above them, who are paid for their services not merely on a calculation of how little a man may live for, but on the theory of the value intrinsically of his labour. This feeling is a sign of an advance in civilization, for it is the perception of the moral values of things as apart from their mere material relations. I speak chiefly of the better class of National teachers, who are indignant that their skilled labour should meet with no higher remuneration than the labour of those engaged in lower spheres of employment.

Uncertainty of tenure of office a grievance.

260. Another grievance of the National teacher is the uncertainty of his tenure of office. He is liable to be dismissed at any moment without notice, and for no fault. The manager is absolute, and the teacher entirely at his mercy. All the teachers I saw, even those most happily circumstanced, were urgent in pressing this matter on my notice. This rather astonished me, as I did not find any instance alleged of the exercise of this power, but on the contrary, the managers were all praised for their kindness. I did not even meet with one case of dismissal; and the length of time which, on the average, the teachers had been employed was a pleasing evidence of the humanity and kindness of the clergy. I did, indeed, hear of cases of severity, but they had occurred out of my district, and I would not mention them were it not that they were quoted by the teachers as examples of what might any day happen to themselves. As I was passing the door of a National school in Cork, the teacher rushed out and told me he had a case to bring to my notice illustrative of the grievance of which I speak. I went into the school, and there I saw a man who bore all the appearances of want and care and fatigue, and with his clothes fast going into tatters. He was a National schoolmaster who had been summarily dismissed to make room for another person who could combine playing the organ with teaching. He produced a good testimonial from his late manager, testifying to his freedom from fault. This sudden dismissal involved the necessity of sending his wife and children to the workhouse, where they were when I saw him, and he had been walking from place to place in search of work for six weeks or more. He spoke with great bitterness of the manager, who had cast him adrift for no fault of his, but merely to suit his own convenience. The teacher of the Carmichael boys' school (Cork) told me that he knew a young man of the first class who was dismissed by his manager because he refused to apologize for using corporal punishment in the case of an unruly boy.

Remedies proposed by teachers.

261. As the matter seemed of great importance to them, I endeavoured to find out what they considered would be the best remedies for the evil. I found that they considered the best remedy would be to place their appointments either in the hands of the National Board, thus rendering them liable to dismissal only by that body, or, while leaving in the hands of managers the power of dismissal, to limit it by specifying the offences for which it could be used. This is pretty much the same in effect as the former and more sweeping plan, which has in view the ambitious aim of making the National teachers members of the civil service. These opinions exclude all recognition of the principle of the necessity for local influence in the schools, and could never be practicable if that principle continues. If the whole educational administration were changed, and a rigidly centralized system take its place, then the National teachers would naturally fall into those relations with the central power which they now desiderate.

Objections to them.

262. But constituted as Irish society is now, I cannot but think that education must have an intimate connexion with religion, and so long as that is the case, there must be local influences in the schools, chiefly clerical of necessity, but also embracing (which I hope) more of the lay element than it does now. Of this I am sure, that in the present temper of the clergy of all denominations, great difficulties would arise if the teachers were to be independent of them, and especially if they continue to originate schools, or are compelled to raise funds for their support. But the present system leaves the teacher so entirely at the mercy of the manager, that something in justice should be done to give him a little more independence, if he is to be not entirely the mouthpiece and creature of his employers.

Absence of pensions a great grievance.

263. Not least among the grievances of the National teachers is the absence of any provision for them in their old age in the shape of pensions. Their small salaries put it out of their power to provide for themselves by saving money, and when incapacitated for further work, they have nothing to fall back upon but the workhouse for support. This termination of their lives they seem to consider as inevitable, unless some provision is made to secure them a subsistence when too old to work any longer. All the teachers I had anything to do with urged the necessity of this as an act of justice. They have rendered services to their country in the cause of education equal at least to those of the soldier and sailor who are provided for when incapacitated, and consider, therefore, that they should be treated with the same consideration. It must be owned that the demand is not exorbitant, if the ground on which they make it is worthy of consideration, which I suppose few would deny.

264. I do not know whether the workhouse, as their final and only refuge, is a phantom conjured up to frighten people into acquiescence with their views or not, as I had no opportunity of judging. I met with no cases of disabled teachers, although I made inquiry, nor did I even hear of a teacher resorting to the

parish for relief. I can only report what I heard from men who had inquired, and who informed me that the workhouse registers are not without records of National teachers whose lives were ended within their walls. And looking beyond the present, it is difficult to imagine what other fate can await persons whose means of living are for the most part barely sufficient to meet their daily wants, much less to enable them to lay up a store against the day of infirmity. These observations will help to throw some light on the question of the supply of efficient teachers in the schools on which I was instructed to report.

Supply of efficient teachers.

265. I suppose by efficient is meant that standard of excellence as regards character, ability, and previous preparation, which ought to be fairly expected in a teacher. Now, as to the supply of teachers, there is as yet no difficulty, but as regards their efficiency more reserve is necessary in forming an opinion if my interpretation of efficiency be the true one.

266. As regards the intelligence generally, and the natural ability and adequate knowledge of the teachers as a body no question can be raised, nor respecting their attentiveness to their duties. But as regards those things which constitute real efficiency, namely, an acquaintance with the science of teaching as expressed by the word education, a moral superiority, as well as an intellectual one, to their scholars and their scholars' parents, systematic maintenance of discipline and order, the possession of good manners, neatness in person and dress, and a good position in public esteem, and lastly, an absence of any physical defects, the supply of efficient teachers cannot be considered as satisfactory. With respect to their powers as educators of youth my report on the instructions and discipline of the schools will give some idea.

Public estimate of teachers low.

267. The bulk of the teachers do not appear to stand high in public esteem. Much of this is owing, no doubt, to the absence of good order and discipline in their schools, and is more prevalent in places where they can be contrasted with the schools conducted by the Christian Brothers, the religious spirit of whose pupils is, in the eyes of the people, combined with their good manners and conduct, their greatest recommendation. I asked a man in Cork, who was apparently a little uneasy about his son's imperfect spelling at the Christian Brothers' schools in Peacock's-lane, why he sent him there. He replied, because they taught him his religion better, and made him practice it better, and because he was not so rough and rude and dirty as the boys were who frequented the ordinary National schools. Another man, who also had his children with the Christian Brothers, said much the same, but added that the masters of the National schools were not good examples to boys. I found in three places a feeling that the teachers were intemperate—one master was mentioned to me by name as being intemperate. I could not discover even through the agency of the police any real ground for the accusation. His appearance was against him, and when I first visited his school he was away, being ill, as the assistant informed me. I went to his house, but he was out, and on the following day, when I returned to examine his school, he told me that he had been very ill with a severe headache. His eyes were anything but satisfactory in appearance. A young merchant who had been educated at a National school himself, told me that for seven or eight miles in every direction round his native town the teachers were either known or said to be intemperate. In one town which I visited the teachers bore a poor name in that respect. There are many exceptions I know, and here I am only trying to show how they are generally regarded.

Absence of better personal habits.

Physical defects.

268. Want of manner, of tidiness in dress, and proper personal cleanliness, are great drawbacks to efficiency, and there were too many such instances. Physical defects too may be seen, which, whatever the other excellences of the person may be, should be a disqualification to become a teacher. The master of the Shirkin Island boys' school was humpbacked, and the mistress of the girls' school had lost a leg, and had to go on crutches. The effect on the children of such sights cannot be good. No great care seems to be taken to select the best persons possible in every respect to fill the important post of teacher.

Managers of schools anticipate difficulty in getting adequate supply of teachers.

269. The managers of schools, in answer to a circular which I append, generally agree in saying that the supply of efficient teachers at the present moment is not below the demand, but anticipate difficulty in getting them. They chiefly mean by that trained teachers, who, when they die out, will not be succeeded by others of the same efficiency; and therefore desire to see such changes made as will facilitate training. But others, as Dr. Rice of Queenstown, see a difficulty arising out of the growing tendency among the teachers to emigrate. The education which a man must possess in order to become a National teacher gives him great advantage as an emigrant. The want of teachers is not yet felt, nor is it apparent, but it cannot fail to come. Already at Queenstown, where the assistants are unusually well paid, the manager informed me he was unable to fill a vacancy, owing to the unwillingness of the men to take up a work which begins with so little and offers such poor prospects at the end. At one of the National schools in Cork, an assistant told me that he and his friends were only waiting to see whether the present Commission of Inquiry into Primary Education was going to do anything for them, and if it did not, they would go to America. More remarkable still was what was told me by another man, a principal teacher of the first class, and more than twenty years' service under the Board. Had he not a family he would emigrate at once, he said.

Present inducements inadequate to secure able teachers, hence necessity for change. Establishment of training schools, and better pay necessary.

270. These facts are worthy of consideration. For if it is desired to induce a better class of men, as regards ability, to become teachers, and not to be obliged to accept through sheer necessity the inferior men, who will become teachers, because able to do nothing else, the circumstances which are now creating so much discontent among them, should be dealt with without delay, and means should be adopted to obtain a supply of really efficient teachers, attached to the Government of the country. Two things are necessary, the establishment of good training schools, and the introduction of some scheme which will secure adequate remuneration to the teachers of the country by which young men and women may be induced to become teachers. The influence of the National teachers should not be overlooked.

Alienation of teachers dangerous. It would be advantageous to win them; means by which this could be done.

271. The teachers possess much influence, and it is a dangerous thing, therefore, to have them estranged in feeling from the constituted authorities of the country. It is not impossible to win them, and it is most important to do it. Take up their case, and, for the good of the whole community, endeavour to remedy what is manifestly imperfect in it. Put them on a level, as far as possible, with the circumstances of the age and country, by giving them the means of living respectably and comfortably, and by helping to insure them some provision against old age; and as the Constabulary of the country, taken from the people, remain loyal and faithful in the midst of an infectious atmosphere of popular discontent, so will the National teachers, too, become loyal and faithful. Give them a real interest in the country, and they will soon take root and learn to identify their own interests with its stability. I would not give them land, for remembering the peculiar sensitiveness of the Irish mind with respect to the soil, I think it would be a dangerous thing to give to a class of men who ought not to be necessarily stationary, for obvious reasons, a gift that might bring about much difficulty. Besides, there would be the temptation to devote too much time to agriculture, and too little to the instruction of their schools. I would remunerate them with money on a scale proportionate to the value of their services. But this involves the question of an increased expenditure, which I admit, but not that that increased expenditure need fall exclusively on the public. I think that society generally should do more for popular education locally than it has.

272. The extent to which local aid should go would be a matter for consideration, but at any rate the amount that would be derived from local sources would go a great way towards supplementing the increased expenditure which the necessity of paying the teachers of the primary schools more liberally would involve. But the expense might be kept down by lessening the number of adult teachers, and by employing monitors or pupil-teachers more largely. The number of assistants is above that of monitors, and in some particular cases the number of certificated teachers in one school is out of all proportion. Thus, in a school in Cork, in which there was an average attendance in 1868 of 112, I found no less than 3 certificated teachers, 1 probationer, and 1 monitor employed, or a teacher for every 22·4 boys. In England one certificated teacher and one articled pupil-teacher would be considered sufficient in a school of that size. The certificated teacher would probably receive £90 a year, and the pupil-teacher's pay would probably amount to a sum ranging from £8 a year to £20. Half of that sum would be provided by funds raised locally, and the other half by the State. This diminution of the numbers of certificated teachers would also be economical as tending to lessen the expense of training, if, as I hope for the sake of Ireland will be the case, normal training schools will be established.

Better payment of teachers implies increased expenditure which local aid should help to provide.

273. It would be a good thing if houses were provided for the teachers. It would give them an air of greater respectability if they were always provided with decent houses, and not obliged, in country places, to reside in places little better than cabins. With respect to the payment of the teachers, I have come to the conclusion, derived from my examination of the National schools, that, on the whole, the principle of payment by results, besides being a sound and feasible one, is the one above all others best calculated to bring into action to their fullest extent, the energy and ability of the teachers, and to improve the present imperfect condition of instruction in the Irish schools. There is a great terror entertained of it by the teachers and the managers of schools, the former preferring, of course, to have fine salaries paid them unconditionally, and fearing that parents will almost set a premium on their children going to school, and the latter dreading the prospect of diminished grants to be made up by their own exertions, and thinking that payment by results necessarily means the introduction of the English system of providing half the expenses of the schools. But these are not really formidable difficulties, and would, I think, disappear if certain exceptional cases were provided for in an exceptional and liberal way. But while paying by results, I think there should be a small yearly sum attached to the teacher's certificate and varying with it, upon which he might always depend, as, for instance, when he first takes charge of a school, and the class salaries of the present race of teachers should be left intact to them.

Provision of house advisable.

Payment by results.

Results as tested by examination, could render teachers more efficient.

274. Starting with a good training system as the foundation of an efficient educational staff in the country, I think that the adoption of some such means as I have in the course of these remarks suggested, would go a great way towards furnishing the country with a class of men whose influence would be used in the cause of peace and order, and who would be employed in bringing out and developing the moral as well as the intellectual faculties of the youth of Ireland.

275. I have reserved the teachers of the Church Education Society for a short notice here. The masters and mistresses are almost all young, and seem to be of, on the whole, a somewhat better class of society than the general run of the National teachers. I did not think much of their intelligence or of their capacities as teachers, though they had, with two exceptions, been educated at one or other of the training schools belonging to the Church Education Society. Their salaries are made up of grants from the Education Society, from local amounts derived either from the donations of private individuals or from the committee that govern their schools, or from the parish funds for discharging the duties of sexton or parish clerk, and amount to on the average of £35 a year, with houseroom, which is more than the majority of the National teachers receive.

Teachers of Church Education Society. Training. Salaries.

276. Their engagements as teachers are always made on the understanding that three months' notice on either side is necessary, in which respect they are better off than their fellow-teachers under the National Board. The clerkship of the church and the mastership of the school are always connected, and the resignation of one implies the resignation of the other. The master and mistress of these schools are sometimes man and wife, and thus combining the salaries, and having houseroom, they are very well off. In Cork and in Bandon their schools being large, attract the best masters, who are paid very liberally. The teacher of the Bandon Model School is by far the best paid, and the most efficient man of all those schools which I visited in connexion with the above-named society. His school, indeed, would bear favourable comparison with the best of the National schools. His salary is about £130 a year with houseroom, and is derived partly from the Erasmus Smith's board and from school-fees, which are paid regularly, the majority of the children being of the middle class. The mistress of the female training school is also well paid, having £80 a year and apartments in the training school. Her school is very small, and is fairly conducted.

Conditions of engagement.

Instruction.

277. My remarks on the condition of education in the National and other schools are based entirely on the results of a careful individual examination of a certain number of children in each of the three subjects which form the staple of Primary Education, as I have no confidence whatever in the system which prevails, at least in that part of Ireland which I visited, of taking the showy answers of a small upper class as representing the proficiency of all the scholars. And since National Education is meant for the many I was doubly anxious to discover how far its benefits were being reaped by the majority of the children in whose behalf schools are founded and maintained at the national cost.

278. I examined 2,011 children in reading, and nearly 1,500 in writing and arithmetic, including every kind of school. As my standard I adopted the system of the Revised Code which regulates the examination of children in England for annual grants to their schools, *exceptis excipiendis*. The children attending school in Ireland are, in each of the 5 classes, of a more advanced age than in England, and their natural intelligence is greater, while they are taught on a larger scale than has obtained amongst us yet. I therefore *widened the English margin* by exceeding a little our English rule of proficiency, and took the liberty of lowering the Irish standard somewhat, in the hope of striking a just balance.

279. I examined 52 schools of different kinds of which 39 were National, 6 were conventual, and 7 were connected with the Church Education Society. Of the 39 National schools 8 are good, 11 are fair, 15 are moderate, and 5 bad. Of the 6 monastic schools one may be considered good, 4 fair, and one bad, and of the Church Education schools none are good with the exception perhaps of the Model Training School, 3 are fair, 4 are moderate and 3 are bad, so that nearly two-thirds of the schools do not come up to the second standard.

Summary of schools.

280. The character of the reading is with a few honourable exceptions much the same in all the schools. It is tolerably correct, but horribly monotonous. There is great fluency, but utter disregard of stops. Punctuation in fact seems to be considered as an useful device for catching the breath, but by no means as having any necessary connexion with the meaning to be conveyed. It is scarcely necessary to say that this appeared a

General remarks on reading.

signal instance of the ill effects caused by the want of training in the masters, who have never learned any more than the children, that reading is an art by which information is conveyed to others, and not merely a vehicle for receiving it ourselves.

First Class in National Schools.

281. The children who compose the first class in the National schools are many of them under six, though rarely ever under five, except in some of the convent schools, where a few children under that age may be seen. The average age of the children in that class who were examined was about seven. Now in an English school those approaching six would be expected to point out the letters of the alphabet simultaneously. In Ireland, however, I found in very few schools any infants who could do that with any facility, while the children who were reading the First Lesson Book did so with much effort, and with no intelligence, and in some cases failed to read at all. It is in the ordinary National schools, that this deficiency is most noticeable, owing to the absence of any special knowledge of the method of teaching young children which exists, and, therefore, of any suitable provision for their instruction.

Convent schools.

282. The convent schools are exceptions. In them that amount of elementary instruction is found to be pretty fairly imparted, owing to the special provision which they are able to make for the infants. But those who have commenced to use books read with only moderate results. The children in the lowest class of the Christian Brothers' schools read better than those of a similar stage of advancement in the National schools. The children who compose the upper classes in all the different descriptions of schools read with fluency and accuracy, although their reading was still characterized by monotony and a general disregard of the rules which must be observed for reading to be good. The results of my examination of the same class of children in the schools of the Church Education Society, were more unsatisfactory than those of any other class of school, except in one or two instances. In three schools I examined a total of 21 children in the first class, and of that number only 13 could read monosyllables, and then only with difficulty—their average age being 8. Indeed throughout every class it was bad. It is unintelligent, frequently unintelligible, and always monotonous and untrammelled by any of the ordinary rules of good reading. Its inferiority was quite remarkable. There are two exceptions, the girls' school and the boys' school attached respectively to the male and female training schools at Bandon.

Christian Brothers.

Church Education Society.

Reading in Convent and Christian Brothers' schools better than in National schools.

283. The reading of the children attending the convent and Christian Brothers' schools was better than I found it elsewhere, which is due to the members of those bodies being of a better class of society, or to their more careful study of the rules for reading. The best reading I heard was in the Kinsale Convent school; it was good in every class, and might be well imitated in some of our best English poor schools.

Writing in National schools.

First Book.

Second Book.

Third Book.

Fourth Book.

284. Under the head of writing is included not merely proficiency in penmanship, but also correctness in spelling and dictation. Many of the children under six are able, in the English schools, to copy simple words and letters from a black board, and all above six are expected to write letters and figures from dictation. The children of the corresponding class in Ireland, as a general rule, can do neither the one nor other, with the exception that a few of the highest divisions can occasionally frame pothooks and hangers. And writing begins to be practised only in the Second Book, when a long period of schooling has already elapsed. In the Second Book the children are all able to *transcribe* with tolerable correctness on slates, a fact which I found so constant that I did not think it necessary to examine some schools in this particular. In this subject I desire to make special mention of the S. Presentation Monastery, of the Kinsale convent, and of Sundayswell girls' school. In the Third Book the dictation is good as regards *caligraphy*, the letters being clear and round, a merit which is, no doubt, owing in a great measure to Mr. Vere Foster's excellent copy books; but spelling is generally imperfect, the children seeming to need more practice. The scholars in the Fourth Book write their dictation on paper. I used to give them a passage from their reading book, reading it once through distinctly, and then reading out three or four words at a time, but never repeating. The writing in this class was very rapid and their spelling fair, but no punctuation. The style of writing was easy, perfectly legible, and neat. Mistakes and errors occurred, but not in sufficient numbers to lower the per-centages of passes in this class to any extent. If the boys were in the habit of writing on paper more frequently they would soon overcome whatever defects are now observable in their work. Their poverty is said by the schoolmasters to necessitate the constant use of slates for all kinds of writing.

Original exercises would be beneficial.

285. Original exercises are very rare in the majority of schools. It would be greatly advantageous to introduce them more generally into the National schools. The scholars who compose these upper classes are old enough to derive real benefit from the practice. It would bring their knowledge of writing into practical use. The plea of poverty ought not to be considered of any value when it is a question of spending 2*d.* on a copy book in which to do the exercises. In the St. Nicholas male National school, Cork, the plan is adopted with much success, as also, I believe, at the Carmichael schools in the same city.

No writing in first class in Christian Brothers' and other convent schools.

286. Writing from dictation is as unknown in the first class of the Christian Brothers' and other schools taught by monks or nuns as it is in the National schools. They follow the same plan of contenting themselves with teaching the children to frame letters from copies until they reach the second class, when they begin to practise transcription, at which they are fair adepts enough. But it seems to be a pity that the work is not made less mechanical just when they are able to use their minds with advantage to its development. To copy from a slate requires no effort of the mind, but to write from dictation requires the memory to be brought into play.

Writing in their upper classes imperfect.

287. While the writing of the upper classes in the Christian Brothers' schools and the Presentation Monks' schools is commendable, both as regards penmanship and accurate spelling, the corresponding classes in the nuns' schools are not so satisfactory in consequence of the little practice which they seem to have in it. The exercises I set them were original, and were given with the view of testing how far their education was being carried on with sufficient solidity to make it of practical value in afterlife. I regretted, however, to see how comparatively superficial it was. Girls, who could have written a copy in a fairly neat hand, when set down with a set of questions to answer, failed either to write good hands, or spell correctly, or put together two or three sentences of consecutive thought in good English. Here again I must name as an honourable exception the convent school at Kinsale, where the exercises of the girls were most creditable.

Church Education Society.

288. In only three of the schools of the Church Education Society did the writing rise at all above mediocrity, and it must be owned that in two of them real excellence was attained. They were the Bandon Female Model School, attached to the training school for mistresses, and the boys' school, attached to the male training school. Of forty-nine whom I examined in the latter school no less than ninety-seven per cent. passed successfully in that subject.

Arithmetic deficient in first class of National schools.

289. In the First Class of the National schools no arithmetic is taught or known beyond a knowledge of counting, and (sometimes) adding small numbers together in its higher divisions. This is curious when it is recollected that the children are, on the average, nearly seven, and that the similar class in England would be required to know—and very rarely fall below satisfying the requirement—how to count up to one hundred, to distinguish between the figures as set down on the black board, and to add and subtract mentally up to ten. This fact seemed to pass the bounds of credibility in the eyes of most of the teachers to whom I mentioned it, and I fear that I seemed to a few

to be drawing largely on their powers of belief. I recollect one man, the teacher of a country school, saying, when he heard it, "Begorra, your honour, they must be wonderful children, then," which exemplifies what I have so often felt and said, that the National teachers have no notion of what can be done, because they have no opportunities of seeing what is being done elsewhere.

290. In consequence of that neglect of arithmetic, the children remain longer in the lower classes than they should, for if not able to satisfy the Inspector, when he holds his examination with the view of promoting from lower to higher classes, in that subject, they are left behind. And I account for the large number of children of an advanced age in the second class by the fact of their being unable to rise out of it, owing to their very imperfect knowledge of arithmetic. The passes in the second class altogether do not amount to more than 62·9 per cent., and when it is borne in mind that the per-centages in reading for this class are high, some idea may be formed of the deficiency of arithmetic. Notation is defective, and accuracy is the exception, the rule being that error characterizes the exercises worked by the children.

Same defects in Christian Brothers' and other schools taught by "religious."

291. The same phenomena are observable in the schools of the Christian Brothers, the Presentation monks, and the nuns' schools, with this additional melancholy feature, that the children who compose the classes in question in those institutions are all much older than in those of a similar position in the ordinary National schools, and are more deficient in this particular.

292. By reference to my analysis of the examinations I held of them, it will be seen that the average of the children in the second class is over 10, and that in some schools it exceeds 12; and the following facts will show how poor the results in arithmetic were in these classes.

St. Finn Barr's convent school.

293. It is grievous to know, that out of 22 girls in the second class of St. Finn Barr's convent school, Cork, of the average age of 10, 15 failed to do the following simple sums in addition, subtraction, and multiplication :—

79	8712	6079
806	2305	6
920		

294. But sad as such a result is, it is nothing when compared with the state of arithmetical knowledge of 21 girls in the third class of the same school, 11·1 years old on the average, who failed without one exception, to work the following easy sums :—

£	s.	d.	£	s.	d.		£	s.	d.
7001	2	4	43	8	4	× 36	6)4214	2	3
904	8	9							

Queenstown convent school.

295. Nor is the state of things in the Queenstown convent school much better. I examined 21 girls, 9·4 years of age, taken from the second class, setting them similar sums to those given above, and only 8 were able to work them correctly, but of that number 2 were merely moderate, and not creditable.

Kinsale convent school.

296. In arithmetic, the Kinsale convent school maintains its character; all the girls whom I examined in the 2nd and 3rd classes passed, although more failures occurred in the higher classes than I expected.

Convent schools unconnected with Board did better.

297. It is curious enough that while such wholesale deficiency is noticeable in the convent schools connected with the National Board, much more satisfactory results followed my examination of the convent schools which do not stand in that relationship. I examined two such schools in Cork, one of them belonging to the nuns of the North Presentation Convent, and the other to the Irish Sisters of Charity in Peacock-lane. In the former place, I examined 30 girls, taken in equal numbers from the second and third classes indiscriminately, whose ages, on the average, were respectively 12·2 and 13·8 years; and owing to their advanced ages, I set them sums twice as difficult as those set to the schools I have mentioned above. The second class passed without a failure, while 6 of the third class were unsuccessful. In the latter school, yet only in its infancy, of 20 girls who were examined in arithmetic, 8 only failed, their average age being 11·5 years. The following are specimens of the sums set to the girls of these two schools :—

864,521	9384)7840757(—
439	

Christian Brothers.

Third class.

298. I must not omit noticing also the disasters which attended the examination of the 48 boys of the second and third classes of the large Christian Brothers' school in Peacock-lane, Cork, which bears a high reputation there, and is considered to be the *ne plus ultra* of school excellence. Twenty-seven of those boys composed the division of the third class examined, and their average age reached to 11·5 years. The following sums were set them :—

£	s.	d.	£	s.	d.		£	s.	d.	
9001	3	4	78	8	5	× 45	40012	3	$1\frac{1}{2}$	÷ 5
905	8	$7\frac{1}{2}$								

but only 9 of them succeeded in doing them correctly. It is fair to add that the Superior informed me that most of these boys had only just been promoted from the second class. But it is curious that boys of such an age should have been so long in the second class. The remaining 21 boys who were taken from the second class were on the average 9·9 years old or in round numbers 10, and were set the following sums :—

Second class.

87	8712	6079 × 6
609	2305	
570		

two of which were worked correctly by only 10 of the boys.

Presentation monks' school, National.

299. In the South monastery school, as it is called in Cork, conducted by members of the Presentation Order, the arithmetical knowledge of the second class was very fairly satisfactory, since of 20 boys of an average age of 10·5 years, only 6 failed to do sums similar to those set in the Christian Brothers' school; but the third class showed the same deficiency as the other schools I have above mentioned, for of 28 boys who were examined only 13 were able to do the sums that were set. This school is in connexion with the Board, and enjoys whatever advantages may be thought to be derivable from it—inspection books, &c., &c. Now, these facts are doubly remarkable as being observable in schools taught by people who have made education their study, and, in fact, their daily occupation, and who are better educated, and have had greater opportunities than most of the National school teachers, in whose schools I must own I never, except in very exceptional cases, saw such poor results.

Church Education Society.

300. Arithmetic in the Church Education Society's schools is, like the rest, very deficient. In table B, p. 144, it may be seen how low the per-centages calculated on my records of the examinations of their schools

St. Luke's Scriptural school (boys).

are, falling very much below the numbers which represent the proportionate success of every other class of school. The St. Luke's Scriptural school bears a high name among the Church Education Society's schools. I was asked by several people whether I had seen it, with a manner which seemed to imply that something like a surprise was in store for me. I went there on a very wet day, most unfortunately, and several children were away, and, of course, the most advanced among them. Only 20 boys were present whom I examined leniently; three only of them were present in the second class, of the ages of 10, 7, 8, respectively, who were ignorant of the simple rules of arithmetic, and knew nothing of notation. In the third class there were 7 boys, 10 years old, on the average, who were said to be doing long multiplication and division, but were quite unable to do either well, and knew *nothing of notation*. Of 11 girls who were present in different classes only one passed in arithmetic, their average being 12.

(Girls).

Arithmetic in fourth class National schools. Specimens of sums.

301. The fourth class in the National schools is the best instructed in every subject, although arithmetic is always the weakest, being on the whole, however, not discreditably taught. My plan of examination was to give invariably a sum in proportion and practice, and sometimes a sum in simple interest. The following are examples of the kind of sums I was in the habit of setting :—

1. Find the value of 237 cwt. 3 qrs. 17 lbs. of sugar at £6 17*s.* 4½*d.* per cwt.
2. A pensioner received in 1864 £23 7*s.* 4½*d.*; how much had he a day?
3. Find the interest on £728 16*s.* 4½*d.* for three months at 3½ per cent. per annum.

Occasionally, when there happened to be a fifth class I would go higher, and try their knowledge of decimals, or vulgar fractions, or give a problem involving some rule in arithmetic. These trials were always attended with success.

302. It is pleasant to be able to report favourably of the success which seems to attend the instruction of the more advanced scholars. I take at random almost from my examination schedules 4 schools from different parts of my district, male and female, and I find that only 2 failed out of a total of 37 who were examined in the fourth class. Much aptitude is displayed by the children of both sexes in learning arithmetic when they reach the fourth class, and their quickness and general neatness and accuracy were remarkable. I visited a rural school about 7 miles from Cork consisting of 2 departments, and found that the fourth class girls had gone through Barnard Smith's Arithmetic very nearly, including the problems.

Christian Brothers' and other convent schools.

303. The Christian Brothers and other monastic schools were in a very satisfactory condition as regarded the arithmetic of their upper classes, who are soundly and extensively taught it. Logarithms, geometrical and arithmetical progression, &c., &c., are frequently read. But the nuns' schools are not so proficient. This is explained by the fact that the nuns are not obliged to prove their knowledge of arithmetic by examination before teaching, and hence do not study it sufficiently to be able to teach it thoroughly in its higher branches.

Church Education.

304. Except in the cases of the two schools attached to the training institutions at Bandon, which are very creditably taught, the upper classes of the schools of the Church Education Society exhibit as much deficiency as the lower ones in arithmetic as well as in other subjects.

Analysis of Examination of certain Conventual Schools.

305. I examined the higher classes of five schools upon paper, namely, North Presentation Convent, the Kinsale Female National school, the Peacock-lane Christian Brothers', the St. Joseph's Female National, and South Presentation Monastery.

306. These schools I propose to analyze at greater length, giving the number in each of the higher classes who passed good, fairly good, fair, and moderate examinations, together with the average age of the children examined in each class. In the North Presentation Convent School, in the second class, out of 15 children examined, of an average age of 12·2 years, in reading 10 passed, in writing 15, and in arithmetic 15. In the third class, out of 15 children, with average 13·8, in reading 10 passed, in writing 10, and in arithmetic 8. In the fourth class, out of 15 children examined, whose average age was 14·6, the reading of 14 was good, and 1 moderate; the writing of 4 was good, of 2 fairly good, of 3 fair, and of 6 moderate; the arithmetic of 1 only was good, of 2 fairly good, of 4 fair, and of 8 (more than one-half) moderate; the geography of 2 was good, of 2 fairly good, of 6 fair, and of 5 moderate; the grammar of 2 was good, of 3 fairly good, of 4 fair, and of 6 moderate. The writing in general is good, at least legible, though rather scrawly. The letters about "Corck," as one or two of them call it, are very poor, only consisting of two or three lines, one proceeding as far as "My dear sir;" and some not being commenced at all. The ages of the pupils in this school is particularly worthy of attention.

North Presentation Convent School.

Kinsale Convent.

307. In the Kinsale Convent School I examined 25 children in the second class, whose average was 8·1 years. Of these 25, *all* passed in reading, *all* passed in writing, and *all* passed in arithmetic, a marked contrast to certain schools in which the children averaged one-third more of their average of years. In the third class, out of 19 children, averaging 12·2 years, all passed in reading, all in writing but 4 moderate, and all in arithmetic but 6 moderate. In the fourth class of 11 children, averaging 15·1 years, all were good in reading, 3 good in writing, 2 fairly good, and the rest fair. In arithmetic 5 were moderate, and the rest bad. In grammar; 5 were fairly good, and 6 moderate. In geography 4 were good, 3 fairly good, 1 fair, and 3 moderate. In the fifth class of 11 girls (monitors), averaging 17·0 years, who were reading the whole of the Fifth Book, 9 were good in reading, and 2 fair. In writing 6 were good, 4 fairly good, and 1 fair. In arithmetic 1 was good, 2 fairly good, 6 fair, and 2 moderate. In grammar 7 were good, 3 fairly good, and 1 fair. In geography 8 were fairly good, 2 fair, and 1 moderate. The handwriting in this school is very good, the spelling not so good. The letters show considerable intelligence, but there is great sameness of style. Most of them introduce their description of the town of Cork in an easy and natural manner, which is not the case in other schools.

South Presentation School (convent).

308. In the South Presentation Convent I examined in the second class 25 children, who were reading the Second Book, but only up to page 125. Their average age was 11·4 years; and 15 *were above* 12 *years of age*, a fact to which I direct special attention. Of these 14 passed in reading, 11 in writing, and 9 in arithmetic. In the fourth class I examined 4 children, averaging 12·5 years. Of these 3 passed fairly, and 1 moderately in reading, 3 fair and 1 moderate in writing. In arithmetic all moderate. In geography 3 moderate, and 1 fair; and in grammar the same. In the fifth class of 23 children, averaging 12·5 years, in reading, 8 were good, 8 fairly good, 3 fair, and 6 moderate; in writing 3 good, 3 fairly good, 13 fair, and 4 moderate; in arithmetic 4 good, 8 fairly good, 8 fair, and 3 moderate; in grammar 7 fair, and 16 moderate; and in geography 17 fair, and 6 moderate. The papers are not very tidy; the geography is poor; and the letters weak both in substance and composition. The handwriting also is decidedly bad. There is a room for needlework, overcrowded by about twice as many girls as there ought to be. The needlework is very good.

309. Out of 20 children whom I examined in the second class of the South Presentation Monastery School, averaging 10·5 years, 18 passed in reading, 15 in writing, and 14 in arithmetic. In the third class of 28 boys, averaging 12·6 years, 25 passed in reading, 17 in writing, and 13 in arithmetic. In the fourth class of 10 boys, averaging 14·3 years, 4 were good, 3 fairly good, and 3 fair, in reading; 3 fairly good, 6 fair, and 1 moderate in writing; and 4 fairly good, 5 fair, and 1 moderate in arithmetic. In geography, 1 good, 8 fair, and 1 moderate; in grammar, 1 good, 5 fair, and 4 moderate. South Presentation School (monastery).

310. In the fifth class of 6 boys, averaging 15·8 years, in reading 4 were good, 1 fairly good, and 1 fair; in writing, 4 fairly good, 1 fair, and 1 moderate; in arithmetic, 1 good, 3 fair, and 2 moderate; in grammar, 2 good, 2 fair, and 2 moderate; in geography, 1 fair, and 5 moderate.

311. The papers are written with a fair amount of distinctness; the letters do not display much individuality; but the composition is tolerably good, though there is very little of it. It is a curious fact that while almost all the boys remark the public buildings and the adaptation of the harbour for commerce, no one notices the climate, the population, or the history, and only one or two its natural beauty. In this school it is to be observed that only one or two put their letters into proper form. Amongst extra subjects taught in the higher classes are book-keeping, mensuration, Euclid, &c. A few boys could draw elementary figures and scrolls pretty well.

312. In the second class of the school of the Christian Brothers in Peacock-lane, Cork, out of 29 boys, averaging 9·9 years, whom I examined, 18 passed in reading, 14 in writing, and 9 in arithmetic. The weakness of the number who passed in arithmetic is remarkable, comparing the high average of the age of boys examined with the easiness of the sums that were given—three rows of figures to be added, not exceeding hundreds—subtraction up to thousands, and division of thousands only by 6. In the third class of 27, averaging 11·5 years, 24 passed in reading, 17 in writing, and 10 in arithmetic. Peacock-lane Christian Brothers.

313. In the fourth class of 93 boys, averaging 13·1 years, in reading 42 were good, 18 fairly good, 16 fair, and 17 moderate. In writing, 17 were good, 24 fairly good, 29 fair, and 23 moderate. In arithmetic, 32 were good, 30 fairly good, 17 fair, 14 moderate. In grammar, 27 good, 11 fairly good, 31 fair, and 24 moderate. In geography, 33 good, 9 fairly good, 15 fair, and 36 moderate (or bad).

314. The papers are distinctly written, but neither questions nor answers are numbered, and the paper is written on both sides. The geography is peculiar—one boy informing us that "Kyaf" (meaning Kieff,) "is a provenc in Scotland," and another, that "Lucern is one of the states in North America." A curious mistake is made by almost all in calling Switzerland "Switzerald." The letters display, as might be expected, the greatest variation in character. They are for the most part rather above what one would expect from such children, or rather they give indications of a good style in the future; generally speaking they are very short, consisting of but two or three sentences. Those which are more ambitious, are by no means the best. Those which purport to give information, are, as may be supposed, better of their kind, than those which attempt reflection.

315. In the second class of St. Joseph's Convent school, Cork, of 14 girls, averaging 10·5 years, 5 passed in reading, 10 in writing, and 1 in arithmetic. In the third class of 12 girls averaging 13·4 years, 6 passed in reading, 9 in writing, and 6 in arithmetic. St. Joseph's, Cork, Convent National.

316. In the fourth class of 12 girls averaging 14 years, 2 were good, 3 fairly good, 3 fair, and 4 moderate, in reading; 7 were fair, 2 fairly good, and 2 moderate, in writing; 1 fair, and 11 moderate, in arithmetic. In grammar, 5 were fairly good, 6 fair, and 1 moderate; in geography, 6 were fairly good, 3 fair, and 3 moderate. The arithmetic seems to be most defective in this school. The papers are tolerably well written but untidy and blotted. The letters were not written at all.

317. The following schools may be dismissed more briefly, notice being taken only of those points in which there is something unusual.

318. *Cloyne Male National School.*—In this school, circulating decimals, double proportion, and advanced interest are taught. Cloyne, male National.

319. *Queenstown Male.*—Geometry and mensuration are taught. The reading in the third class was very poor and monotonous and without intelligence. Grammar in half the class fair, the rest moderate. Geography (Europe) good. Answering on subjects of reading lessons very poor and wanting in intelligence. Queenstown, male.

320. *Clogheen, near Cork.*—Reading very indistinct. Children do not exhibit any intelligence—mere parrot knowledge. Second and third classes not up to the mark in arithmetic. Writing inferior to most other schools. Spelling bad. First class better in reading. The master supplies ink and pens. Writing is in some cases suspended owing to the unwillingness of the children to buy pens. Pens are frequently borrowed of their neighbours. I saw one boy who has borrowed the Fourth Reading Book and steadily refuses to buy it. Clogheen, near Cork.

321. *Castlemartyr Male.*—The children of this school are remarkably well and soundly taught; they read better than usual in National schools. They know the meanings of the words in their lessons, and express themselves with great clearness and precision. Grammar is well advanced and syntax is known in the third class. The geography is excellent. The dictation was not read first as was usual, but only one girl made a mistake. The fourth class was deserving of the highest praise. Castlemartyr.

322. *Cove of Kinsale National.*—First class—first division know nothing; second division read words of three letters in First Book badly. They cannot count or add. The second class read fairly but monotonously. Grammar embraces the noun only. Geography *nil.* As a specimen of the amount of meaning which they attach to their reading, I may mention that "ocean" was defined as an "island," and a "continent." In arithmetic, they can only add as far as 1,000. In the second division the reading was fair, but no meaning was attached to the words. Grammar—they knew nothing of the definitions. In the third class the reading was better, 4 convent girls read and answered questions remarkably well. The spelling was good and they understood something of the meaning of words. Grammar moderate. Geography bad; *e.g.*, the Shannon was said to "run" into the Pacific! Nothing was known of Scotland, Ireland, or of France—Scotland said to be in France. Arithmetic was bad—only to simple division not including long multiplication. Cove of Kinsale National.

323. *Kinsale, No. 1, Male.*—The first class in all divisions was bad. The first division knowing nothing of the alphabet, nor of counting. The second division read words of two letters very imperfectly. No counting done. They could not distinguish the days of the week. The third division read badly, count to ten wretchedly and know nothing of the days of the week. They answered, however, questions in their lesson. Writing, *nil*, the letters being copied either very imperfectly or not at all. In the second class, the first division read and explain badly. No grammar or geography. In the second division, no grammar nor explanation in spelling, nor geography. Ocean taking the apparently popular form of an "island" or a "continent." Third division—explanations poor, grammar *nil*, spelling moderate, geography and definitions imperfect. In the third class, the explanations were moderately done, the grammar and geography moderate, but the dictation bad. Fourth class—unable to work a sum in proportion; grammar, fair; geography, *nil*, St. George's Channel being considered to be the east boundary of Europe, and the Rhine to flow into the Mediterranean. Kinsale, No. 1, male.

St. Mary's Convent, Queenstown.

324. *St. Mary's Convent, Queenstown.*—The third class read better than usual, not so the monitors. There was a little mispronunciation. The explanation of words and of the lesson was good. Grammar fair. Geography of Ireland only moderate. Arithmetic, notation to tens of thousands fair. The class was only just promoted. In the second class the answers were very bad, not much intelligence displayed. Geography bad. Nothing was known of Europe.

St. Nicholas' female, infant.

325. *St. Nicholas' Female Infant.*—The first class count badly, and know nothing of addition. Second class—reading good, writing good, arithmetic fair, especially notation. Multiplication table not known.

St. Nicholas' male preparatory.

326. *St. Nicholas' Preparatory Male.*—Second class read badly, writing bad, grammar fairly good, arithmetic fairly good, geography bad. Third class read tolerably well, grammar bad, adjectives being confused with conjunctions; geography bad, arithmetic bad.

St. Nicholas' male.

327. *St. Nicholas' Male.*—First class—the days of the week were not known as such, but mechanically. The children could not say what happened in winter, and the months were not fully understood. In the second class geography and grammar were good. Third class geography moderate. Fourth class grammar good. Fourth and fifth classes—grammar, geography, and geometry, to Second Book, composition and the usual grammatical exercises are done on paper. Analysis and book-keeping are taught. Answering in every subject was very satisfactory, as may be seen by referring to the tables on pages 140, 144.

Passage West, male.

328. *Passage West.*—Four boys learn geometry, one mensuration. Drawing is to be taught. Reading in the first class is accurate, spelling good. The first division write letters and figures, and have commenced notation, and add up to ten.

Skibbereen, No. 1, male.

329. *Skibbereen, No. 1, Male.*—In the second class spelling is good and grammar bad, an "adjective" being defined as a "verb" or "abverb." No intelligence exhibited in the use of words. Geography moderate, only the outlines of the world. Multiplication table good, money good, weights and measures bad, notation fair. Third class—grammar moderate, dictation bad, writing bad and crooked, words not spelt properly, *e.g.*, "inimies" for enemies, and "pray" for "prey." Arithmetic not good, failed in compound division. Mental arithmetic good, geography bad, particularly of Ireland. Fourth class—reading moderate, arithmetic good, dictation fairly good, grammar moderate, and geography moderate.

Skibbereen, No. 3, infants.

330. *Skibbereen, No. 3, Infants.*—First class read monosyllables painfully slowly, spelling each word, some not knowing their letters if suddenly changed. Addition bad, especially in lower division. Senior division answers questions and spells well. Writing on slates poor. Second class, first division read very well, and answer questions with much intelligence. Grammar fair, geography very poor.

St. Patrick's infants' school, Cork.

331. *St. Patrick's Infants', Cork.*—Reading of school in general bad. Second class especially could hardly spell any of the words of the lesson. Arithmetic of first division bad. They can repeat addition table by rote, but cannot add as an exercise of reason. Arithmetic of second division accurate and rapid.

Church Education Ballymoney school.

332. The Ballymoney school, near Bandon, and connected with the Church Education Society, was the worst of any. Not one-third of the children passed in reading, not one quarter in arithmetic, although more than half were above 12 years of age.

Christ Church, Cork.

333. *Christ Church, Cork.*—In the second class, average age 9, notation was wretched, children could not set down thousands. The writing slovenly, mistakes uncorrected in the copy-book. Geography almost unknown, though professedly taught; *e.g.*, "London said to be on the Liffey," &c. Third class could hardly read at all, but were quick at answering questions in reading lessons, though unable to express themselves in a consecutive manner.

Baltimore.

334. *Baltimore.*—The first class read fairly and write badly; they could not form their letters. Second class read Third Book fairly, but spell badly. Write in copy-books untidily and with a want of freedom; arithmetic, notation to hundreds; multiplication of two figures; short division commenced. Third class read badly, no grammar at all; geography moderate; definitions hardly known; writing moderate.

Bandon, female Training.

335. *Bandon Female Training.*—First class, writing good (words and figures), equal to first standard in England; general knowledge moderate. Second class generally good, except grammar. Third class, reading good, writing good, arithmetic low for third class; no compound rules, long division being the limit; grammar respectable, geography very fair.

Bandon model Training school.

336. *Bandon Model Training School.*—Second class had proceeded as far as reduction, third class as far as proper fractions, fourth class interest, decimals and proportion. The higher classes learn vulgar fractions, Barnard Smith's problems, and mensuration. First class, reading bad, no knowledge of what they had read. Second class, grammar, up to verb and adjective, moderate. Third class, arithmetic moderate, geography fair.

Midleton.

337. *Midleton.*—First class, arithmetic bad, general knowledge most imperfect; second class, reading wretched, low toned and inaccurate, arithmetic poor, only to simple subtraction, done by only half the class; geography moderate, Pyrenees described as "dividing France from England," and North Sea, as "situated in Ireland;" definitions not well known. Third class, reading fair, dictation *nil*, words being mutilated, notation unknown, millions being written for thousands.

St. Luke's Scriptural school.

338. *St. Luke's Scriptural School.*—This school is inspected by the Church Education Inspector whose report I read. I only saw the second, third, and fourth classes, the *élite* were away, prodigies I infer from report on algebra. I can only say that the children of the second and third classes, though examined leniently, acquitted themselves disgracefully, the arithmetic was miserable in both, a boy in the second class, who was said to be doing division could not do subtraction, and the third class boys no higher than long division, some in multiplication of three figures, which they could not do, no notation. The reading was wretched, indistinct, and without intelligence, in some instances the words were miserably mutilated. The third class did dictation but poorly, with many mistakes. Grammar bad, "of" called a noun, adjectives called verbs. Master defended himself by saying the boys had been only just promoted into higher classes; I made allowance for this, but the children were unable to do anything. The fourth class was rather better in reading, grammar better, as far as distinguishing parts of speech, but no syntax, arithmetic poor, all failed in proportion; a sum involving a leap year was given, which one and all made to contain 466 days; a simple sum in practice was given, but half did it incorrectly. Girls' school worse, dictation miserable, except in a few instances; and reading of third class quite unintelligible. Geography poor, arithmetic of second and third classes *nil*, fourth not doing higher rules than compound multiplication. In the second class, average age 8, none passed in any subject. In the third, out of 7 children average age 10, in reading 2 passed, in writing none, and in arithmetic 2. In the fourth class of 10 children, average age 11·4, in reading 4 passed, in writing 4, and in arithmetic 1. In the girls' school there were 11 examined, 3 in the second class, average age 10·7, 3 passed in reading, none in writing or arithmetic; 4 in the third class, age 9·8, none passed in reading, 1 in writing, and 1 in arithmetic. In the fourth class of 4 girls, 3 passed in reading, 1 in writing, and 1 in arithmetic. Their average age was 12·8 years.

Girls' school.

Higher subjects.

339. Besides the ordinary subjects of instruction, in the National schools, and in all others, grammar and geography are taught in every class above the lowest. And in the upper classes it is the almost universal rule to find the higher rules of arithmetic, such as interest, compound proportion, geometrical progression, learnt by a few scholars. Occasionally, algebra, Euclid, and mensuration, may be found. In the Christian Brothers'

schools the higher mathematics are frequently read, as well as a certain amount of physical science. I do not profess to give any information as to the efficiency with which any other subjects beyond grammar and geography and the higher rules in arithmetic are taught. It was out of my province to deal with them, and, moreover, I had not sufficient time. I simply mention the fact that they are taught with satisfaction. Of the condition of grammar and geography not much can be said, except of the higher classes of the National schools, which are fairly instructed in those subjects. But their numbers are small, and the ages of the scholars composing them are high. It will be recollected that not more than 10 per cent. of the number on rolls can be reckoned in the upper classes, and that their average age is not less than thirteen. Still it is satisfactory to know that even under such circumstances there is a certain number of school attendants learning subjects which rise above the mere elements. I found at Passage West a very intelligent knowledge of physical geography, and of the rules of grammar as tested by parsing. At Cloyne, the senior boys were able to explain, with great intelligence, an eclipse, the cause of the seasons, and seemed to find no difficulty in naming all the countries, with their chief towns, on the surface of the globe contained within certain given degrees of latitude. The same can be said of the Christian Brothers' and the Presentation Brothers' schools, generally, in these respects in which, besides, composition is taught, a subject very little practised in the ordinary National schools. Similar success, unfortunately, does not seem to attend the efforts made in the convent schools. The ages of the pupils in the higher classes do not seem to help to make the higher branches of instruction more vigorous. They are as feeble and as imperfect as the lower classes.

Grammar and geography well taught in upper classes,

340. The successes attained in these subjects, as, indeed, in everything in the upper classes, must not be considered as an index of the state of the junior classes. The children composing them are supposed to learn them, but very little can be shown for the trouble and time bestowed upon them. In the second class geography is very little known, and, upon examination, I found more than 50 per cent. of the children wholly unable to pass in it at all, and in grammar it was no better. The geographical definitions were known only in a very confused manner, oceans being confounded with islands, and continents with seas, and so on; while a similar confusion of the parts of speech showed their knowledge of grammar to be equally superficial. The geography of Ireland was as badly known as any other. If the map was put before them they could point out the places quickly enough, but they failed to exhibit any knowledge as retained in the memory. In Cork not more than 37 per cent. of passes were secured in grammar and geography by the second class. It is doubtful whether it is a wise plan to teach grammar and geography to the junior children at all, considering how difficult it is to get them on in the three chief subjects. But if they are taught, care should be taken to obtain better results. Very few in the ordinary National schools learn drawing. I only met with three schools in which it was taught; but singing in the girls' schools is very generally taught. The teachers can more easily learn singing, and there is more encouragement to teach it, owing to its popularity. In the nuns' schools it is respectably taught, but not as regards the theory, except in the Kinsale convent school, where the girls are taught to sing from note as a regular daily exercise. They practice the scales carefully, and a class of girls who went through the trying ordeal of singing an exercise before me acquitted themselves with great credit. Much value seems to be attached to it by the clergy and others. It civilizes and refines them. A gentleman, Mr. M'Carthy Downing, the present member for Cork, expressed his satisfaction with the good effects which the singing the girls of his neighbourhood learned at the convent produced on them.

deficient in the lower classes.

341. Industrial education is, of course, confined to the girls' schools, and consists of instruction in sewing, knitting, lacemaking, and crotchet work. In every girls' school sewing is necessarily taught daily, an hour being, as a rule, given to it. The schoolmistress teaches it, or if the school is a mixed one, under a master, some woman is employed for that purpose. In the convent schools the nuns themselves superintend the industrial education of the girls with an efficiency that far surpasses any of their literary efforts. Besides plain sewing, they teach ornamental work, such as embroidery, crotchet, &c.; and in some convents, the sums realized by the industry of the girls are enormous. At the Ursuline convent at Blackrock, near Cork, I saw a large amount of very beautiful crotchet work, so fine as to resemble lace. It has a great reputation, the nuns told me, and, I believe, it is patronized by the French Empress. At Kinsale there were some beautiful specimens of lace worked by the girls, and their fancy and plain work realized in one year £1,100, most of which went to the girls. The Superior told me that at one time they did large amounts of crotchet work, but she gave it up, as she saw that, when they left school, the girls got into idle and gossiping habits, as the work did not require any great attention or exertion. In the ordinary schools, no attempts are made at fancy work, but plain sewing, cutting out, are sufficiently well taught to be of use to the girls in life. In these respects the schools are invaluable to the country. It seemed to me, on examining the needlework, that the Irish girls are, as a rule, better taught than our English girls; but, of course, they remain at school longer than our children do. I must not omit to notice the excellence of the specimens of needlework which were shown to me at the Bandon Female Training School. It was quite equal to the best of ordinary National schools, and excelled many of them.

Industrial occupations.

342. A few words on the general condition of the intelligence of the children may not be out of place here. By the intelligence of the children I do not mean their natural capacity, of which there can be no question. Quickness, aptitude, and intelligence, are not wanting; there is plenty of it, but it is, for the most part, raw material. It is not put sufficiently under the influence of education, and so remains undeveloped and unfolded, in most cases, apparently for the whole of their school course. It is in this respect that I think the intelligence of the Irish school child is unsatisfactory. The children who remain at school until they reach the highest class are examples of what might be done more generally. Their reasoning powers are all alive; they are quick to observe, to compare, and to conclude. They are prompt, and, for the most part, accurate. I speak of the boys. I tested them by questions on their reading lessons, which I sometimes would request them to summarize, and their efforts surprised me. Arithmetic tests very fairly the extent to which a child's intelligence has been benefited by education, and the passes in the upper classes were, on the whole, very satisfactory indications of good results in this respect. I do not mean to say that I was satisfied that their instruction gave many indications of exactness and method. I did not expect it, knowing how little training their teachers had had; but it seemed to me that the children whom I am describing had benefited very largely by their education in some of the larger meanings of the word.

Intelligence of children:

good in upper classes;

343. With respect to the children lower down, however naturally apt, as they undoubtedly were, very little can be said in their praise. They were, as a rule, most mechanically taught. They could read, but in most cases the meaning of what they read was not apprehended. It was with the greatest difficulty I could get a child in the Second Book to answer the simplest question about his lesson, sometimes put in the most leading way. Their minds seemed to be lying fallow, or if not that quite, the soil had not been far penetrated. The want of interest displayed by these children in what they were doing, and their distraction of mind, made it one of my most disagreeable tasks to examine them. Most of my questions were met with entire silence, or with answers wide of the mark. The children in the lowest classes were very dreary. Their lessons were dreary, the method of their instruction dreary, and its results had thrown very little light on their minds.

inferior in lower classes.

I have over and over again failed to get from children seven years old any proof that they knew the days of the week, or if they could say them off by being started, they would fail to say what day succeeded another if the regular order was broken. Their knowledge of colour and form was very slender. It was not an unfrequent occurrence to find an entire ignorance at that age of the difference between a round and square thing, or between red and black. They are not taken in hand and thoroughly taught on any plan, which might, by kindling some interest in their little minds, open them up to receive information. Here again I say, apply the treatment of payment by results and trained teachers, and the disorder will disappear. Girls are not naturally so intelligent as boys, though they are quicker to learn, and, bearing this distinction in mind, I think that much the same may be said of the girls' schools as of the boys'. The girls in the convent schools, indeed, full of gentleness and modesty as they are, do not display very much intelligence. Their minds have not grasped the substance, and remain closed to the meanings of the things they have learned. They have no sparkle either, and their classes present most inanimate pictures. They need some contact with the quickly moving tide outside them to quicken them into activity. Perhaps the timidity and shyness which is more perceptible in the convent schools than in any others may account for the comparative dulness which they display. Their infant classes are the brightest of any. It was always pleasant to see them.

344. But nothing in them was equal to the intellectual torpor of the Church Education Society's schools. Everyone knows the effect that is produced upon children by setting them down in a room and giving them nothing very particularly interesting to do, or by setting them tasks which they are not helped by explanation or illustration to master. It not only makes them dreary, but, under the pretence of education, it leaves the mind almost as shut up as before. Such are these schools in appearance, and such are they in reality. They are the most melancholy places I visited. The same spirit appeared to possess both the teachers and the scholars.

Discipline important,

345. The discipline of a school is one of its most important points. It lies at the foundation of progress of all kinds. Without it progress in learning is impossible, as is also progress morally. It is one of the great moral instruments in education, as it produces habits of obedience and respect for authority, of self control, and of concentration of mind on the work to be done at a given time. Where it does not exist there instruction will be imperfect and superficial, and success only partial; and where it does exist the chances are greatly in favour of its being good. I expected to find in the good order of the National schools the evidences of such an appreciation of the value of good discipline, but I was greatly disappointed. If I found it efficient in one respect, it was sure to be deficient in another. The boys, perhaps, would move from their seats in order, but in their seats would talk without restraint; or if not very noisy, would be fidgety and look about incessantly. But in nearly all the National schools there was a recurrence of almost the very same things. The minds of the teachers did not seem to be possessed with the importance of maintaining discipline continually, and of making it a habit. Noise was checked, I thought, much more because it interfered with their comfort than because it militated against the efficiency of the school, and instead of a habit of quiet existing, that element of good order appeared to find an occasional place only where the teacher enforced it by exercising a special act of authority. The noise and murmur in the National schools were very trying. The habit of talking, with the listless, vacant looking about so prevalent in them, is fatal to learning. One of the parts of good discipline is to keep the children constantly occupied, but talking and looking about are fatal to it.

but very deficient in National schools.

346. Then the manners of the scholars were rough and untamed, but no effort seemed to be made to soften them. It was curious to me to notice the conduct of the children in the first schools I visited, forming as it did so great a contrast with what I had just seen in England. The children of a class I examined at Sundayswell, while doing their sums, occupied themselves in thumping or pinching each other at intervals, but the master took no notice of it, and let them do as they pleased, and when the boys were told they might go home, they rushed in a body from one end of the room to the door, quite unchecked. Making allowances for the difference of sex, the same faults mar the efficiency of the girls' schools.

Copying and prompting prevalent.

347. One of the greatest evils in the disciplinary system of almost every kind of school is the prevalence of the wretched habits of prompting and copying. They destroy self-reliance and individual progress, and are really immoral, because they are dishonest. But I could not discover that they were considered in this light at all. They are the habits of the children; it is natural to them to practise them, and so they carry them on in the most open manner. I endeavoured at first to check them, but my admonitions were forgotten the moment after they were made, and I had to give in and make the best of it. Had I sent away the children, I should have been left without any to examine.

348. The convent schools were quite as bad in this respect as any others, which may partly be owing to their rooms being sometimes crowded in consequence of the bad arrangement of desks which prevails in Irish schools. But they are, in point of order, quiet, cleanliness, &c., &c., very much superior to all other National schools. It was always a relief to me to go into a convent school after being engaged for any time in the ordinary schools. The neat dresses, the clean faces, and well-combed hair of the girls, and their pleasant, modest ways, used to compensate in my eyes in a great measure for their other defects. This part of the convent schools' training is doing much for the coming generation, by civilizing through these means its mothers.

Children dirty.

349. The children attending most of the ordinary schools are miserably dirty. Unwashed, uncombed, and filthy, they make even a large room well-nigh unbearable on a hot day. I exclude the Presbyterian and Church of England National schools from the application of these remarks, although they cannot escape censure as regards copying.

Discipline of Christian Brothers' schools.

350. The Christian Brothers maintain better discipline than any other teachers. Their schools are patterns of good order; the boys are always clean, and as tidy as their circumstances in life will allow, and do not copy and prompt to the same extent as the pupils of other schools, but they might, if they had more teachers, do better, too, in this respect.

Church Education Society.

351. The discipline of the Church Education Society's schools is what might be expected in most small places, and is in keeping with their general condition. But in the two schools at Bandon, often mentioned in this report, discipline is more effective, and is more in keeping with their instruction. The boys' school is very well ordered in every way, and I must say that very little copying was visible in it.

352. Much of the civilizing effect of primary schools depends upon their good discipline, as well as their efficiency as the instruments of instruction. It is difficult to explain how it is that so important a matter should be so much neglected in the National schools.

Religious instruction.

353. Instruction in religion is commonly given to scholars of National schools, subject to certain regulations laid down by the National Board, which were framed to protect the faith of children of different denominations. A card with the words "religious instruction" is directed to be suspended in a prominent place, in the school-room, and children of a creed different from that professed by those who are to be instructed are to be excluded during the lesson, unless, indeed, a special request be made in writing, according to a prescribed form by the parents or guardians that any particular child or children should join in such religious instruction. The people of different creeds are so separated from each other in educational matters that there is little opportunity for such rules to be of any practical value, but they are, nevertheless, very literally observed.

354. The teachers in the National, as, indeed, in all kinds of schools, are the instructors of the children in religion, but they are more exclusively so in the schools under Roman Catholic management, in which the clergy very rarely give any kind of religious instruction, no doubt in consequence of their numerous duties. In the Presbyterian and Established Church schools, while the teachers give lessons daily in catechism, &c., &c., the clergy do not fail to attend more or less frequently during the week, and take their part in the work. The minister of the church with which the Carmichael schools are connected attends once a week at least, and gives a lesson in religion, while Dr. Webster, besides attending at the Model Schools every day for the same purpose, finds time to give religious instruction frequently during the week in his own parochial schools. The occasional performance in person of this duty by the minister of religion invests the lesson with a more distinctly religious character, and renders it more impressive than when it is exclusively given by the teachers, except in the schools taught by "religious," whose profession, and lives, and dress seem to carry about as much weight as a priest's does. Teachers as a rule instruct in religion.

355. The instruction given consists, in the ordinary Roman Catholic schools, exclusively of lessons in the authorized catechism, which are committed to memory and explained by the teacher, while in the Protestant schools, besides the catechisms recognised by their respective Churches, a portion of Scripture is read either by the teacher to the children, or by the children themselves. In the Christian Brothers', the Monks', and the convent schools, it is much the same in principle, except that it seems to partake more of the character of a religious exercise, and that the explanations are made more fully, and have a more practical character. The adjuncts of religious objects, such as statues, pictures, flowers, and sometimes lights, go far to make the lesson more penetrating than where it is not so accompanied. It was out of my province to examine in religion, and I had no means, therefore, of testing personally the comparative excellence of the instruction as given by the "religious" and by the ordinary teachers, but I was informed that the difference was quite in favour of the former. Subjects of instruction.

356. The portion of time devoted to this kind of instruction is generally half an hour daily, in the ordinary schools from 3 to 3.30. At its conclusion prayers are said, consisting, in the Catholic schools, of the acts of Faith, Hope, and Charity, the Lord's Prayer, and the Hail Mary. In the convent schools, the lesson is given at mid-day, instead of in the afternoon, and is accompanied with hymns, &c., &c. Time devoted to it.

357. Much care is taken in the Church Education schools to make religion the first and most prominent thing, and as the principle of that body is to make the Scriptures the direct appeal in all matters, they are read daily to the children. Much of the text is also committed to memory, as well as the Catechism of the Established Church by its members. The school day begins and ends with prayer and reading the Scriptures. I was pleased to find that religious instruction was given in all the private schools I visited. It was a pleasing evidence of the depth of religious feeling in the Irish character. Religious instruction in Church Education Society's schools.

358. I have endeavoured in the foregoing observations to throw some light on the condition of instruction as I found it in the district to which I was sent. They can do no more than describe in outline its state; but I have endeavoured to give as much detail as possible in the tables which come immediately after these remarks. They are an analysis of the condition of instruction in each class of every description of school examined; and combining, as they do, the circumstances of age, classification, and proficiency, some correct estimate may be derived from them respecting the relative proficiency of the children examined. But while leaving the Commissioners to draw their own conclusions, I think it not out of place to make some reflections of a general character on the condition of primary education in Ireland, so far as it came under my own observation. General remarks on instruction.

359. Now, the efficiency or inefficiency of any system of education must be tested by the results it produces, and the value of those results must undergo the further test of being considered in relation to the circumstances of the ages of the children at school in each class, their natural intelligence, their rapidity of progress, &c., &c., or, in other words, in order to pronounce an entirely favourable judgment, it is necessary to be assured not only that the system is doing good, but that it is doing as much good as it ought, and that it is doing its work at a rate of progress reasonably commensurate with the circumstances to which I have above alluded. It is in this way that the education of the country must be judged, otherwise the probabilities are that we shall fail to be impressed with its defects in contemplating its actual usefulness.

360. Now two facts strike me at the outset, and ought to be borne in mind as important considerations. They are the large number of children in the lower classes, and the small number in the higher, and the high average ages of the children composing them. The proportion of scholars above the third class does not amount to more than 12 per cent., being in the National schools only 10 per cent., while in the two lowest classes it is about 70 per cent., or more than two-thirds of the whole number. These proportions become much more serious when the ages of the children are recollected. In the first class, the average age, including infants, is not less than $6\frac{1}{2}$ years, and in the second class $9\frac{1}{2}$, while in the third class it is above 11. The condition of the first class with respect to age is worthy of attention, because in it are included children under 5. The importance of these facts rests on the conclusion which I deduce from them, that 88 per cent. of the Irish children leave school, after being there 7 years, unable to work a sum in proportion, or to write a piece of dictation correctly on paper, and without a sound knowledge of what they have learnt. Nor is it unimportant to know that nearly 70 per cent. of the scholars spend 5 years at school without being able, at between 9 and 10 years of age, to work simple sums in the four first rules without failing to the extent they did under examination. Another fact worthy of note is that while 12 per cent. are really well taught, and can pass an examination creditably, being of the average age of 14, the majority fail in an increasing proportion as they descend in classification, being just the opposite of what is observable in England, where the junior classes universally, so far as my experience goes, do the best, the failures occurring in the highest classes. This occurs, too, where the teaching staff is so large.

361. All classes of schools present the same phenomena, except those of the Christian Brothers, which are exceptional, so far as having the numbers more equally distributed in the classes, but which with the convent schools present higher average ages than the National schools, being equalled by the Church Education Society's schools in this respect.

362. Then, again, if we regard the quality of the instruction given, there is not much reason for satisfaction. For if the first class is below par in every respect, being very imperfectly taught, as is evident from the fact that only in one instance did this class reach a per-centage of 66 in its passes, and in the majority of cases was below 50, and in one place, Skibbereen, was as low as 43, the second class is very imperfect, its reading is poor and its arithmetic imperfect, and the intelligence of the children to a great extent unawakened. They bear, indeed, all the marks of either neglect or inefficient teaching. In the convent schools, and even in the Christian Brothers' schools, the failures in this class and in the third were sadly large. There is throughout the schools a want of efficiency, which seems to be owing to the absence of a real knowledge of the art of teaching, or of adequate teaching power. The question arises how all this can be remedied. First of all, I believe the great remedy in the National schools will be to have well-trained teachers, and in the convent schools and others to subject the teachers to some test of their competency to teach, and with respect to the Christian Brothers, to endeavour to bring them into connexion with the State, and thus enable them to employ more

teachers, and persuade them to modify, in some respects, their present system by changing, for instance, their custom of not bringing on their pupils equally in the three staple subjects of instruction. At present, the National teachers, whether secular or "religious," with the best intentions, are unable to do much, owing to their unacquaintance with the art of teaching. They seem to be unable to deal with numbers by employing a simultaneous method of teaching, and prefer to teach the younger children individually.

363. By a course of training of sufficient length the teacher would acquire these methods, and learn their value, besides learning to appreciate the value of good discipline as a great means towards securing real efficiency. But besides training, what is needed to stir up the energy of all concerned in the schools is the adoption of the English system of payment by results. The younger children, who, being in the majority, would bring the largest grants, would no longer be neglected, and would receive an equal share of attention,

TABLE A.—Showing in each Class the Average Age of Children, the Number Present, and

DISTRICT, DESCRIPTION OF SCHOOL, NAME OF SCHOOL.	Number of Children present at Examination, and entered on Examination Schedule in each of the Classes.						Average Age of Scholars.						Per-centage passed in Reading, Per-centages calculated upon the whole number

and limits of age should be fixed, so as to bring the scholars as rapidly forward as would be consistent with sound instruction; and the presentation of each child for examination in a higher class in each successive year would fill the school classes more equally, and thus give a child, by the time he is 12 years of age, a chance of being able to write well, and to do the higher rules of arithmetic with fair facility. The adoption of some plan is needed to make the education of the country as good as it ought to be, and would be, with the abundant supply of teachers and schools that now exists. It is sad to see so little resulting from the expenditure of money, time, and power which is now made.

364. The following tables contain an analysis of the results of my examination of every description of school. I have so constructed it that the relative proficiency of each may be seen together with the ages of the children examined.

Per-centage which passed the Examination held at various Schools in the Cork District, so far as visited.

Writing, and Arithmetic, in each class. of Children actually present at the Examination—viz., 2,011.													Per-centage passed in the higher subjects. Per-centages calculated on the whole number of children actually present at Examinations.					District, Description of School, Name of School.

SCHOOL FINANCE.

Finances of National schools simple.

365. The finances of the National schools are not complicated, being comprised, in the majority of cases, exclusively under the heads of Government grants, and school fees. State aid takes the form chiefly of a teacher's salary, and not, as in England, of a grant to the school by which the managers are expected to keep the school buildings in good repair, to buy books, to pay the teachers, and generally to maintain efficiency, and so the accounts of the Irish National schools are no more than records of the various sums of money which are paid to them by the State. Their simplicity is a great contrast to the comparative complication of English school accounts. How far it would be possible for that simplicity to last, if the principle of making grants to the Irish schools were to be altered—which I cannot help hoping will be the case—is a doubtful question.

No subscriptions.

366. To one accustomed to examine the accounts of English schools, the entire absence of subscriptions of any kind to the National schools in Ireland is very remarkable. Neither in the shape of collections made in churches, nor in the form of donations from private individuals are there any indications of a local interest taken by any section of society in the schools. A few honourable exceptions exist, but they are too few to disprove my assertion. Sermons in their behalf are unknown almost—I certainly never heard of a case in which pulpit advocacy was resorted to by any school manager to create a school fund. Not even the nuns are so favoured, although in the case of the Christian Brothers an exception must be made to this statement, as their cause is pleaded occasionally from the pulpit, but only, or very seldom oftener than, when they are establishing or opening new schools in any locality. I know of but three National schools which are in any way assisted by the contributions of charitable people, they are the Saint Patrick's infant schools in Cork, the Guardian Angels' schools a little way out of that city, and the Saint Nicholas schools, for which subscriptions are regularly made, and from year to year seem to increase. The Presbyterian schools in Cork are maintained efficiently by the Government grants, and by the school-fees, which are sufficiently large to make up the salaries of the teachers, who, however, have a guarantee from the managers of £40 a year in the master's case, and of £30 in the mistress's, above their class salaries, in case the school-fees should fail.

Schools not advocated from the pulpit.

Only three National schools aided by private individuals.

Landlords do nothing.

367. Landlords take no interest at all in the National schools on their estates; they never visit them, they contribute nothing to them, and in one case I found that the landlord had turned the school out of a house it once occupied in a healthy locality, and it was then driven into a wretched cabin, which only through Mr. Vere Foster's benevolence became at all habitable.* I cannot help thinking that absenteeism, and the difference of

Causes.

* This was at Baltimore, and was done by a nobleman who is now dead, and whose name, therefore, had better be left unmentioned.

religion between the landlords and the mass of the people have much to do with this, although I am not insensible of the effect which the origination of a universal scheme of education by the Government must have had in deadening the sense of individual responsibility about education by, through the establishment of its schools, removing the occasion for its action. State action.

368. People act, as a rule, under the pressure of a necessity which is visible to their eyes, but if it be removed out of sight, it is soon forgotten, as well as its relationship to them. The need of education was supplied for the mass of the Irish when the National system was established, and their sense of individual responsibility seemed to fade away and never to have revived. The members of the Established Church, however, were not relieved of their burden, owing to the disfavour with which they regarded those regulations of the National Board which related to religion. They therefore set to work, and tried, as some think wrongly, to create a system of their own, which, despite its defects and incompetency, called forth much energy, demanded some sacrifice, and required continued efforts to maintain. It was the combined action of the members of the Established Church in Ireland which created the Church Education Society, and which maintains it now. They combined because they had before their eyes a great social want which it was necessary to supply, and that combined action, reacting upon individuals, stimulates their sense of responsibilty, and produces the local efforts which are made by the members of the Established Church to educate the children of their poorer brethren. Efforts of Established Church.

369. The Church Education Society itself does not in any one of the schools connected with it which I visited supply a quarter of the funds required for their yearly support. In the majority of them local efforts are depended upon, and do not fail, apparently, to be successful. Thus the salaries of the teachers of the St. Luke's Scriptural schools are guaranteed up to a certain extent by a committee. In Kinsale, a lady undertakes to supply books to the schools, and to repair the buildings. At Ballymoney, in the Bandon district, the mistress is dependent for her salary upon local subscriptions. The master of the rural school at Enniskean receives half his salary from the Duke of Devonshire and others, while the Myross school is, similarly, the object of the bounty of a former Lord Carberry, who endowed it, his bequest being supplemented by an annual subscription from the present lord. Church Education Society furnishes little. Local efforts do most.

370. I am fully alive to the fact that the Church to which these schools belong contains the wealthy landed proprietors, upon whom they are able to fall back for support, and that, therefore, it is hardly possible to compare them with those in which the most numerous class is educated without being unfair to the latter. But I believe that less is done for the Church Education schools by the great proprietors, and more by the efforts of the middle classes, than is thought. Of the fourteen schools of that connexion which came under my observation only five seemed, from the facts I collected, to be benefited by the proprietors of the soil directly. No doubt they benefit by their good-will, and that is a great deal. It is the active co-operation of the resident middle classes with the clergy in the cause of education I so much admire, and which I consider might furnish a good example for Catholics to follow, if they desire earnestly a denominational system, but which it is hardly probable will be granted unless the members of the different religious bodies agree to take part of the burden of maintaining their schools on their own shoulders. Activity of Protestants.

371. The objection may be raised, that the Protestant community is for the most part made up of a middle class, able with money and with intelligence to work in the manner I have described, whereas the Catholic body is as yet without such a class. I admit the force of the objection as regards the rural districts, but not as regards the towns, where such a class does exist, and might act most beneficially on the more important educational operations that are being carried on in them. The city of Cork possesses a large and intelligent middle class, and the provincial towns, too, are not devoid of people of sufficient social importance to be of use to education. But with the exception of a few people in the former place, no one knows anything about the schools, or seems to care about them. Whatever is needed must be supplied by the State; whatever is to be done must be done by the State; and so nothing is done locally. This is why only a quarter of the expense of educating a child is supplied from local sources in the part of Ireland which I visited, while in England half of the cost must be raised locally. Catholics might do more. State looked to for everything as regards education.

372. The National schools depend, as I have said, chiefly on the grants paid by the National Board of Education. These grants are made under the heads of class salaries to teachers, monitors' salaries, gratuities for training monitors, premiums for good order and cleanliness, &c., good service allowance, sums for teaching drawing and music and sewing, and the profit derived from the sale of books. Government grants,

373. The National schools which I visited, taught by secular teachers, and having an average attendance of 3,845 children, received for the year ending June 30th, 1868, a total sum of £2,527 13*s.* 9*d.*, being an average grant of £53 15*s.* 7*d.* per school, or 13*s.* 1¾*d.* per child. £39 17*s.* 8*d.* of that total sum is the profit derived from the sale of books granted to the schools by the National Board at twenty-five per cent. discount. to National schools,

374. Seven National schools taught by religious communities, with an average attendance of 2,953 scholars, received, for the same year, a total sum of £1,305 16*s.* 10*d.*, giving £186 10*s.* 11*d.* as the average amount granted to each school, and 8*s.* 10*d.* as the average sum for each child in attendance. By adding together, these respective totals of £2,527 13*s.* 9*d.* and £1,305 16*s.* 10*d.*, and dividing by the sum of the average attendance in each of the two classes of schools—viz., 6,798, we get 11*s.* 3¼*d.* as the general average amount paid by the public towards the education of each child attending the National schools of all descriptions, being 1*s.* 3¼*d.* more than is paid in England for the same purpose. to Conventual National schools. General average.

375. In the above calculations the payments of school pence are not included, which farther on I will show to amount, at the most, to 4*s.* 4½*d.* on the average. Now, if that amount be added to the average of 13*s.* 1¾*d.* paid by the State for each child in the forty-seven National schools under secular teachers, we shall have 17*s.* 6¼*d.* as the sum of money which is spent annually in the education of each boy and girl attending those schools. Each scholar, therefore, contributes, at a very high estimate, about one-fourth the cost of his own education, although more probably he does not contribute more than one-fifth. Average cost of education, including fees.

376. It is worthy of note that whereas, in the case of the ordinary National schools, by far the larger portion of the grant goes into the pockets of the principal teachers and the assistants, in the case of conventual schools, less than one-fifth of the grant goes to the teachers themselves, the larger share going to the monitors. In the ordinary National schools of £2,527 13*s.* 9*d.*, only £90 12*s.* 5*d.* can be counted as going to pay monitors, thus leaving £2,437 1*s.* 4*d.* for the salaries of the teachers of all classes. In the conventual schools, on the other hand, of £1,305 16*s.* 10*d.*, only £573 11*s.* 11*d.* were paid to the teachers, the balance, £732 4*s.* 9*d.* going to meet the expenses of monitors' salaries, &c. This disparity does not escape notice or remark. I cannot say that the persons directly interested in the matter ever made it a serious matter of complaint, although they all expressed a desire to have a more equal distribution made, forgetting, however, that the State, if it offers them remuneration on a lower scale than that which prevails in the ordinary National schools, dispenses, in their case, with the qualifications which it is so strict in exacting in the secular teachers. If the "religious" of both sexes would put aside their prejudices against undergoing the test of examination, Comparison of grants.

and would condescend to become certificated, and thus fully take part in the scheme of National education, I have little doubt they would be remunerated in the general way.

Cost of education in Church Education Society's schools high.

Reasons.

377. The amount of money spent on the education of the children attending the schools of the Church Education Society is greatly in excess of the average cost of educating a child attending the National schools. From the facts which I gathered respecting thirteen schools, I conclude that £2 0*s.* 0¼*d.* was spent during the year ending June, 1868, on the instruction of each child in average attendance, the average number in daily attendance in those schools being 393, and the total expenditure being £786 10*s.*, towards which the children contributed only £60, or 2*s.* 10½*d.* each, or somewhat more than one-nineteenth. I consider this estimate below the mark, as I was unable to gather the amounts spent in repairing the buildings, in fuel, in books, and other smaller matters. But large as the amount is, it need not surprise one, for the cost of education consists principally in finding sufficient to maintain teachers, who, whether there are few or many scholars, require a certain amount of money to keep them in respectability. There are no less than 18 teachers employed in the instruction of the 393 children in daily average attendance in these schools, being about one teacher to every 21·5 scholars. It is not, however, extravagance which causes this unusually large proportion of teachers; it is a necessity, arising out of the smallness of the Protestant population in the country, and their determination to have schools of their own. Only one of the 13 schools to which my remarks apply has an average attendance above 50, 7 of them fall below 50, ranging between 48 and 23, and 5 of them fall below 20, 2 of that number having as low an attendance as 12.

Examples of size of schools

Christian Brothers;

379. It is really a matter of difficulty to estimate exactly the cost of educating a child in the schools of the Christian Brothers. It can only be an approximate estimate. They consider that if they are guaranteed £35 a year for each brother's maintenance they can undertake to educate 100 boys each. But besides that, they must have houseroom furnished them, which is very far superior to any of the houses occupied by ordinary schoolmasters, so that the estimated yearly value of these buildings being thrown into the calculation, the yearly sum which each child's education costs would exceed the sum which is paid in money to the Brothers. In their schools in Cork they have an average daily attendance of 1,610 scholars, for whose instruction 19 Brothers are provided, whose yearly maintenance, at £35 a head, would come to £665, to which if the amount of school pence be added which was paid at the end of the school year 1867—£129 about—we shall have a total sum of £794 spent in the instruction of 1,610 boys, or about 9*s.* 10¼*d.* per head, but no account is taken of books, the value of the house, &c., &c., &c., which would probably bring the average amount up to 10*s.*, the estimate which the Brothers themselves consider to be correct. At Midleton, their schools are attended, on the average, by 399 scholars, and 4 Brothers are employed in teaching, who receive £150 a year from the parish priest, which gives an average sum of 7*s.* 10¼*d.* as the cost of education per head in those schools, exclusive of school fees.

estimate in Cork;

In Midleton.

Cost in different schools.

380. It would appear from the facts I have given respecting these three classes of schools that the cost of education is highest in the schools connected with the Established Church, being more than twice as great as the cost of instruction in the National schools, to which, however, they produce results as inferior as their costliness exceeds them. The National schools come next, and the schools of the Christian Brothers and other religious communities take the lowest place in the scale. These sums are cried out against as, in one instance, too heavy to be borne unaided, and in the other as too small for the maintenance of efficiency, and there is a feeling prevalent that all must be helped by the State.

Aid demanded unconditionally.

381. But while the schools of the Established Church will seek to lighten their burden by obtaining State aid through the establishment of a denominational system of education, the members of the Catholic body will also seek to improve the pecuniary condition of their schools by no other means than an increased expenditure of public money upon them. The one community will cry out for relief from the straits to which they are put, whilst the other will protest against any attempt being made to induce them to undertake any responsibility at all; and both will concur in demanding help on their own terms. Regardless of all economical considerations, State aid will be expected to be afforded in the fullest manner, on the one hand, to each separate school of the Established Church, however small it may be, while, on the other, increased aid will be deemed a necessity and a right, together with a loosening of the restrictions that now exist. The Protestant will declare his inability to do more, and the Catholic will protest his inability to do anything.

382. It is difficult to estimate fully how far the assertions regarding the impossibility of raising anything locally for the schools in Ireland are real. I have no doubt that those who say it is impossible fully believe what they say; but if the experiment has never been made, how can the assertion be fully relied on? One thing is certain—it is that nothing yet has been attempted to be done for religion in Ireland which has not succeeded, and if the education question be made denominational, I am unable to see why it should not succeed in asserting its claims on the charity of the people. What would be asked of the people would not be much, and it would have the effect of bringing them more into contact with the education of the country. But still the fact is plain, that the bishops and the clergy are unanimous in the opinion that it is hopeless to expect anything from local sources in that part of Ireland which I visited. The Bishop of Cork had no kind of

doubt about it. He said that the people in the more distant parts of his diocese are too poor to support schools in any way. The Bishop of Cloyne was equally clear and strong in expressing similar opinions, and the Bishop of Ross spoke in the same strain. I own that the latter prelate's objection had some force with me, as it was easy to see how really poor the people in his diocese were. But there is no reason why exceptional cases should not be treated in an exceptional manner.

School fees.

383. I was instructed to report on that part of school finance which comes under the head of school fees. I found that the amounts derived from this source were really the only form of local support received by the schools of the National Board, and that they do not make as great an addition to their funds as they should, considering the numbers in average attendance, and the rates of payment existing in them. The following facts will, I think, make this statement clear.

Average amount of fees in National schools.

384. In 41 National schools, attended daily on the average by 3,010·6 scholars, the fees amounted to no more than £659 19*s.* 10*d.*, giving therefore £16 1*s.* 11¼*d.* as the average amount received by each school in fees, and 4*s.* 4½*d.* as the sum paid by each child towards his (or her) education during the year ending June 30th, 1868. This amount, although it is considerably lower than the corresponding one in England, is much higher than the general average for Ireland. But it is also high for the district I visited, the general average for which would be not more than 3*s.* 6*d.* if certain National schools in the city of Cork were excluded in which the fees are unusually high, owing to the numbers of well-to-do children who attend them. In none of those schools do the fees fall below 6*s.* per scholar. The comparative prosperity of the population in most parts of the country which I visited will also explain why the school fees are higher in my district than they appear to be elsewhere in Ireland; and it should be borne in mind that in the rural districts, including the country towns, a very large proportion of the children attending the National schools are of the farming class.

Scale of payments of fees.

385. There is not one uniform rate of payment prevailing, but a scale is fixed by the managers sometimes, more generally by the teachers, which I found in every school to include payments from 1*d.* to 5*d.* a week, while in some schools they went up to as much as 10*d.* a week, this, however, being quite the exception. Three pence a week is I believe the true average rate of payment in each school, although the majority of children pay 1½*d.* and 2*d.* a week. In only four schools did I find 1*d.* and 2*d.* a week to be the limits of payment, while in seven schools it reached 10*d.*, the former being in the district of Skibbereen, and the latter in the city of Cork. I found only one purely rural school in which every rate of payment was in existence. In the country towns I found no payments higher than 8*d.*

Average weekly rate of payment.

Average payments in different districts.

Skibbereen.

Kinsale.

Midleton.

386. I have said that the average for the whole district would be not much more than 3*s.* 6*d.*, if certain schools were excluded from my calculation. The following facts will illustrate this. In the district of Skibbereen the total amount of school fees paid in seven National schools with an average attendance of 672 children, amounted to £65 10*s.*, which gives the small sum of 1*s.* 1½*d.* as the amount of money paid by each child for a whole year's instruction. In the district of Kinsale the average was higher. In seven National schools with an average attendance of 456 scholars, the fees amounted to £72, which gives an average payment of 3*s.* 1¾*d.*, by each scholar. The same rate I found existing in the Midleton district.

In Cork fees low.

387. In the city of Cork, from its greater commercial activity, it might have been thought that the rate of fees in the National schools attended by the lower classes would be higher than elsewhere, but such is not the case, the average amount of fees for these schools being not more than 3*s.* 1*d.* This low figure is explained by the circumstance of the majority of the National schools being resorted to by the poorest of the population, the better part of which is educated in the Christian Brothers' and other educational establishments conducted by religious communities, and in which no charges are made for instruction. To give examples—In the St. Patrick's Female National School, where the daily average attendance amounts to 106 children in round numbers, the total amount received in school-fees for the year ending June, 1866, does not amount to more than £13 4*s.*, giving the small amount of 2*s.* 5¾*d.* as the payment of each scholar. In the infants' department of the same school the disparity is still greater, for the total amount of fees paid by 131 children was only £13, or 1*s.* 11¾*d.* per child. In those convent schools connected with the Board in which fees are paid, with one exception, the disproportion between the number of scholars and the amounts of school-fees is still more striking. In the girls' school at Skibbereen, taught by the Sisters of Mercy, I found £9 about to be the whole sum paid in pence by an average attendance of 384 girls, or 5½*d.* by each girl. This is really gratuitous instruction.

In convent National schools fees lowest.

General average payment too low.

388. I now proceed to consider the question of school fees generally, as to whether the average amount paid by each child is in proportion to the time he is at school, to the average rate at which payment is made, and to his ability to pay. The sum of 4*s.* 4½*d.*, I consider, bears no fair proportion to the time for which each child in daily average attendance and paying fees is at school during the year, or to the average rate of payment I found prevailing. Each school is open on the average 220 days, or about 30 weeks in the year, and 3*d.* a week is the average rate at which the children are recorded in the school register as paying. Now paying at that rate, and going to school for that time, each scholar would, at the end of the year, have paid 7*s.* 6*d.*, and each of the 41 schools to which these observations apply, having an average daily attendance of 70 scholars, would have received £28 5*s.* 9*d.* instead of £16 1*s.* 11¼*d.*, or £12 3*s.* 9¾*d.* more. But as this calculation is made for the whole number in average attendance at each school, without deducting the proportionate number of non-paying scholars, it may not be considered fair, since, in every primary school, there must necessarily be a certain number of free children. But even making allowance for this, and deducting from the 70 attendants 20 per cent. for free children (which is about the proportionate per centage of scholars enrolled in these schools as receiving gratuitous education), the amount actually paid in fees falls below the sum that should be received—viz., £22 16*s.* 3*d.*, instead of £16 1*s.* 11¼*d.*

389. To recapitulate briefly, I have shown that in the National schools which I visited there is no average rate of payment in any district amounting to 5*s.*, 4*s.* 4½*d.* being the sum paid, on the average, by each child attending these schools, and that this payment in one district is as low as 1*s.* 1½*d.* Although in particular schools 12*s.*, and even £1,* may be reached, and 5½*d.* be the other extreme, it is certain that no school teacher receives, on the average, more than 4*s.* 4½*d.* in school pence towards the increase of his small salary, and in many cases receives much less.

Low rates of payment more the result of unwillingness than of inability.

390. Is this rate of payment the result of inability to pay more towards their children's education, or is it the result of unwillingness and capriciousness? I believe it to be the latter; for it must be remembered that the majority of the people who send their children to school agree to pay for them; and the facts I have stated show that if payment were to be actually made according to the terms agreed upon, the salaries of the teachers in fees would be much larger than they are now. All the teachers whom I saw think that they ought to have more income from this source, and say that if those in authority were to move in the matter they would not have occasion to complain as they do of irregularity and capriciousness in the payment of school-fees,

* The Carmichael male and female National schools alluded to, in the former of which, with an average attendance of 51, the school-fees amounted to £55 for year ending June, 1868.

and its general accompaniment—irregular attendance. All of them recommend the payment of fees weekly in advance.

391. I cannot throw any of the light of statistics, I regret to say, on this matter, but must content myself with repeating the statements of the National teachers, who volunteered information and seemed to speak with sincerity. They urge, as a great grievance, not gratuitous instruction in the case of those who *cannot* do anything for themselves, but a system of gratuitous instruction which parsimony and mere unwillingness forces on them; and they insinuate, if they do not plainly say, that they are not supported by the clergy in their efforts to obtain the money which the parents of scholars voluntarily agreed to pay for their instruction. They complain that the arrangements between themselves and parents cannot be enforced, and that if they could be, the managers would stand in the way of their enforcement, or if they did not, the children would not be sent to school. Two cases were brought under my notice in the course of my inquiries which illustrate the general indifference of the clergy with respect to this question. In one case, the master of the school told me that he was once obliged to refuse admittance to a boy, who was a paying scholar, on account of his irregular attendance. The boy, or his parents, appealed to the manager, who gave him a letter to the master, which obliged him to give in and take back the boy as *a free scholar*. This instance, though it does not profess to bear very directly on the point, is nevertheless useful as illustrating the small concern taken by the manager in the welfare of the master. The same teacher informed me that he had three scholars (brothers) who were being taught free of charge, on the supposition that they could not afford to pay school-pence. At length, one of them was removed into the higher department, which he entered as a paying scholar. Upon hearing this, the master dismissed the other two, but was soon obliged to receive them back. He returned fifty-nine as the number of children professedly free in his school, but assured me that very few of them were unable to contribute something towards their own instruction.

Examples of indifference of managers in this matter.

392. The other case was still more striking. The son of a well-to-do woman who kept a shop was sent to one of the National schools in the place as a paying pupil. The payments, which should have been made weekly, were allowed to run on, and the teacher's applications for them were disregarded. His patience being at length exhausted, he dismissed the boy from the school, upon which his mother appealed to the manager, and was immediately furnished by him with an order for his re-admittance, which the teacher had to grant.

Indifference of managers to be regretted as injurious to people and teachers.

393. Now, if it be the case that this irregularity in paying what, after all, are just debts, inasmuch as they were voluntarily contracted, does exist, and is not discouraged by those who could check it, it is doubly to be regretted, as a great opportunity is thus lost of strengthening in the people the sense of the natural obligation by which they are bound to educate their own children, or, at least, to co-operate in the efforts made by others for their instruction; and as an act of unfairness is in effect done to the teachers, who, being badly paid by the State, look to the school-fees as an important means of increasing their stipends. It cannot be said that the clergy have not the power to improve this state of affairs. No one who has any notion of their influence among the Irish people can doubt it. It is too great generally to fail in a matter which contains so largely the religious element.

They have the power to correct irregular payments.

394. It has been exercised in a few instances with sufficient success to establish the conviction in my mind that the same could be done more generally than is now the case. In a few schools, the managers have, by their influence, reduced the numbers of non-paying scholars to the lowest limits possible, by refusing free admission to any but the really poor, and by expelling such as will not pay their fees. Thus, the teacher of the Ballinora National School told me that his manager had arranged with him to admit none but the really poor as free scholars, and to compel all to pay who could. This school, with 134 on the rolls, has, of that number, only thirteen who professedly pay nothing, and, nevertheless, it is as well attended as any other—perhaps, he said, better; at any rate, the payment of fees makes no difference in the attendance. Again, in a poor neighbourhood in the district of Skibbereen there is a National school in the parish of Kilmacabea which is attended by the usual mixture of farmers' and labourers' children. The manager, a sagacious and zealous priest, arranged with the teacher to admit none free who were able to pay school-fees, and to dismiss those who refused to pay them. Two individuals were determined to try the strength of his resolution, and steadily refused to pay for their children, who were accordingly removed from the list of scholars. They were then sent by their parents to another school which, however, being inconveniently distant from their houses, they were soon sent back to the first school, and gave no more trouble on the score of fees. A little determination at first would be met with grumbling and opposition, but, in the end, would succeed in removing what is bad for the people morally, and unfair to the teachers.

Reasons of unwillingness to pay fees. 1st. Payment of teachers by public.

395. One of the reasons of this irregularity in paying fees is the payment of the teachers by the National Board, which the people consider is sufficient to relieve them from any obligation to contribute towards their maintenance. The schoolmaster or mistress is regarded as a servant of the Crown, and is remunerated out of funds which, in the end, only come out of their pockets. It is an objection to double payments, and is very analogous to the feeling with which a man refuses to give in private charity because he has paid his poor-rates. It is a feeling, according to my informant above alluded to, especially prevalent among the farmers.

2nd. Isolation of National schools.

Another reason which I think may be assigned for it is the isolation of the National schools from the people of all classes. They were established without any active co-operation of the people whom they were meant to benefit, and no measures are taken by the clergy to create any such interest in the schools as would tend to stimulate their flocks to render them as effective as possible. It cannot, therefore, be a matter of surprise that the people who never have the schools brought before their notice should be slow in doing anything for them.

Contrast of Christian Brothers' schools.

Take the Christian Brothers' schools, and what a difference there is! The people are ready to make sacrifices to have them, and, when established, to keep them effective. The reason is, because the clergy bring these schools well before the notice of the people, and use strenuous efforts to keep them flourishing. If they did the same for the National schools, they would not have to complain of the apathy of the people about them, and they would raise them and their teachers up to the standard which they sometimes deplore that they do not attain.

Gratuitous instruction generally prevalent.

396. I now come to consider the subject of gratuitous instruction, recognised as such, its extent, its necessity, and effects. Broadly speaking, all educational establishments are free—that is, they impart instruction without charge to all who choose to avail themselves of it. The numerous schools conducted by religious communities, almost without exception, teach gratuitously; and those which form the exception to this rule receive such trifling sums in school-fees, compared with the great numbers attending them, as hardly to entitle them to be regarded other than as free schools. Such are the Christian Brothers' schools, the South Presentation Monks'

Church Education schools free.

schools in Cork, and one or two convent schools in connexion with the National Board. The schools of the Church Education Society derive something from school-fees, but the average sum, even including in the calculation the large and almost middle-class school in connexion with the male training school at Bandon, where the fees are high, does not amount to more than one-nineteenth of the whole average cost of educating

each child attending its schools. I found that the average payment per head taken for 13 schools did not amount to more than 2*s.* 10½*d.*, the cost for the education of each child being about £2. But the lower classes among the Protestants of the country are no better off than the Catholics, and their numbers are not great.

National Schools only payment of fees a source of income.

397. The National system is the only one in which the payment of school-fees forms an important part of its finance; and, consequently, all the schools, with but few exceptions, in its connexion, excepting the majority of the convent schools, derive some income from the payments of children. But even the National schools are obliged to succumb, in some measure, either to the prevailing feeling in favour of free education, or to the necessities of poverty, by tolerating, as I have shown, irregular, capricious, and uncertain payments, or by giving gratuitous instruction to a considerable number of the children who attend them. I found only one school of those taught by secular teachers entirely free—the village school at Leap, in the parish of Kilmacabea. Two others, indeed, were said to be free, but their books contained entries of school pence. Schools such as the Carmichael National in Cork do not contain any free children, but they are exceptional, being attended exclusively by the children of people in easy, or at least comfortable, circumstances; and of the nuns' schools in connexion with the National Board which I visited four were partly gratuitous, and three were wholly so; but in the former class there was no rate higher than 2*s.* 5*d.*, and it descended in one school to 5½*d.*

Proportion of free children in National schools.

398. The proportion of free children in the National schools, according to the entries on the rolls, does not amount to more than 20 per cent. The registers of the 41 schools from which I derive the facts on which these calculations are made contain the names of 5,495 children, and of these, 1,397 are avowedly free, being about 20 per cent. or nearly one in five, which is a small proportion, and does not represent, by many degrees, the true proportion of non-paying scholars, who amount, in reality, to above 37 per cent.; 20 per cent. only expresses the ratio of pupils who are professedly free, whilst 37 per cent. expresses the real number who do not pay, composed of those last mentioned, and of those, who, though enrolled as paying scholars, fail to deserve this title through default of payment.

Extent of gratuitous instruction in Conventual schools.

399. It is, however, in the monastic and convent schools that gratuitous instruction is most prevalent. The numbers and great size of these institutions, containing as they do together many thousands of the youthful population, give to education in the towns, a largely gratuitous character. In Cork alone they educate 7,053 children free of all charge to their parents, or more than half of the whole school population. And what happens in Cork is the rule everywhere, more or less. Thus in Bandon, omitting a school, not a large one, which I was unable to visit, of 1,348 children on the school registers, not less than 850 are educated in the convent schools there free of cost. Or again, in the town of Kinsale, in which there are 725 children on the school registers; of this number the Sisters of Mercy educate 541 free, or more than 74 per cent. If the number of children in the "secular" National schools who are receiving gratuitous education were added, the number would be considerably increased. In Skibbereen 483 children are gratuitously taught out of 786 who are supposed to attend school. These instances illustrate the state of things as to gratuitous instruction. *Ex uno disce omnes.* In these four towns, in which 14,204 children are inscribed on the rolls, not less than 8,533, or about 60 per cent., are educated entirely gratuitously. The convents almost universally educate without receiving anything. It is a part of their rule to do so. The only exception I found to it was the Queenstown convent, in which the number of paying pupils, according to the register, was 476 as against 207 who did not pay. Two others indeed take school pence, but the sums are so trifling that they are hardly worth mentioning.

Bandon.

Kinsale.

Skibbereen.

The effects of this vast system of gratuitous instruction.

400. The first feeling is one of satisfaction at seeing such great opportunities of advancement bestowed so unreservedly on the poor, and especially on such poor as compose the masses of the Irish lower classes. But I am not sure whether the feeling is not one of admiration for the spirit of charity which has produced all these institutions, and of sympathy with its disinterestedness, rather than of admiration for its principle, which does not work out good results. I believe myself that it, eventually, is a depressing, and therefore a bad, thing, for a people to have everything done for them either by the State or by combined social action on a large scale; and as regards education in Ireland, I feel it to be most important to encourage and subsidize local efforts, but not to destroy them through over kindness. People value what they pay for, but care very little for what costs them nothing. And if it is an object to create in the minds of the people such a real value for education as will tend to induce them to make the best use of the opportunities that are given them for obtaining it, then one of the wisest plans would be to throw some obstacles in the way of purely gratuitous instruction. At present, the great cry is the irregularity of the children in attending school, notwithstanding the free access there is to all kinds of educational institutions. Bad weather and bad clothes, summer and winter, and seed time and harvest are all brought forward to explain this irregularity, and, perhaps, with reason; but one of the real reasons is to be found in the fact that the people have no pecuniary interest in sending their children to school; if they had, these excuses for non-attendance which I have just mentioned would be seldomer made. It is certain that all the paying children are the best taught, and the most regular; this, without a dissentient voice, the teachers all asserted. The men of the longest experience all concurred in saying that it would be more for the good of education if it were made less easily accessible. I must content myself with citing the instance of a convent school in exemplification of this. The Sisters of Mercy at Queenstown began by teaching gratis, but after a time thought it better to alter their plan, and substituted instead a system of fees, the only effect of which was to make the girls more regular and the school more effective. It is a matter for regret that the religious orders who conduct schools do not follow the example of the Queenstown nuns, even though, by so doing, they should somewhat infringe their respective rules; for they are helping very many who do not require such unqualified aid, and are demoralizing them by helping to smother their self-dependence and self-respect by removing from them the necessity for performing one of the most sacred duties, that of educating their own children. And unless their schools adopt this plan, it will not be possible for the National schools to become more stringent as to school-fees, at least wherever convents exist. It is worthy of remark that the attendance as to time at the nuns' and monks' schools, despite the double charm of religion and free admission, is no better than in ordinary National schools, in which fees are paid and the modicum of religion taught is very slender. In no school of that class did I meet with an instance of an average attendance in days that exceeded eighty-five, excepting the Christian Brothers' schools, which are quite exceptional. Besides the teachers, I found many of the clergy, indeed the most of them, advocates for the payment of fees by the scholars. It is somewhat in contrast with their practice which is to lean rather towards the people than towards the teachers when the question of fees is in dispute. Their opinions can be seen in their answers to my circulars which I publish in the Appendix of this report.

Better attendance would result from payment of fees.

School Buildings.

Classes of National school buildings.

401. The buildings in which the National schools are held fall into the three classes—First, those vested in the Commissioners of the National Board; second, those vested in trustees; and third, the non-vested schools;

and according as they come under one or other of these headings may their comparative excellence be determined, the buildings vested in the Commissioners being the best as regards repair, &c., those of the second class coming next, and the third description of schools taking in every respect the last place.

Comparison of condition of * V.C. and V.T. schools.

402. The difference, however, between the two first classes does not amount to more than that variation in the condition of their repair which one would expect to find between buildings, which, on the one hand, are periodically overlooked and attended to at the public cost, and, on the other, are only seen to when absolute necessity demands that something should be done. The fabrics themselves are pretty nearly equal; for, having been both partly erected at the public expense, the same care was taken to insure an equal degree of excellence in both. But while the public discharges its obligation to maintain good repair in those buildings which it keeps in its hands, the trustees seem to perform that part of their engagements by uncertain and spasmodic efforts, which, besides, are removed at long intervals from each other. It is a question of money merely. No one feels the outlay on the schools held by the Commissioners, but every farthing laid out on those held by trustees, comes out of an individual's pocket, and is grudgingly given.

Relative number of buildings.

403. I visited 33 buildings in which schools are held under the National Board, and of that number 2 only are vested in the Commissioners, and only 4 in trustees, while 27 are non-vested. This great preponderance of non-vested schools may fairly be taken as indicating the unwillingness of the clergy to have more to do with the Board than they are obliged, and especially to give them any such hold upon education as the possession of legal rights in the school buildings would entail. But while allowing full value to such an explanation, it must not be forgotten that many of the buildings in question have been used as schools for many years, indeed long before the present feeling of estrangement from the governing body in Marlborough-street had become so general; and it is not unfair, therefore, to suppose that either owing to the desire to lose no time in establishing schools, or to unwillingness to raise the necessary funds to meet the building grant from the Board, buildings possessing the smallest amount of suitability were resorted to and have been continued ever since to be used as schools.

Schools vested in Commissioners.

404. Schools vested in the Commissioners are found in the greatest numbers in the western part of my district, where I saw the two buildings I have alluded to above; but the Bishop of Ross, Dr. O'Hea, informed me that there were 11 such in his diocese. Having had personal experience of the non-vested schools in that district, I was inclined to congratulate him on his good fortune in having so many really good buildings.

Two vested and non-vested compared.

Those which I saw were situated at the extremities of the Skibbereen Constabulary district, one of them being the girls' school at Shirkin Island, and the other in Couscroneen, a village in the parish of Myross. Before seeing them I had on each occasion an opportunity of visiting a non-vested school. On my way to Shirkin Island, I passed by the beautiful Lough Ine lying to the south-west of the town of Skibbereen, in the hope of being able to visit the Pookeen National school, situated on the slope of one of the hills overhanging the lake. It was closed, but I was able to judge of the building from its exterior—little more than a cabin, its roof was thatched, and green with moss and damp, while three or four small windows imperfectly supplied with panes of glass contrived to let in the rain as well as the light.

Baltimore school, non-vested.

Thence I went on to Baltimore, where I sought the National school, and which, although it was holiday time, I succeeded in seeing. It was once a cottage, and was meant to be anything else than a school. One-half of the building had been renewed lately, and formed a great contrast to the other half, which was fast approaching ruin, its walls being out of the perpendicular and streaming down with damp—even in the month of August—which was rotting the maps that hung against them. The windows—on one side only of the building—were half devoid of glass, for which, indeed, there was no hold in the rotten and broken frames, while through the roof you might almost study the stars. The floor was once—not long ago—mud, but has since been boarded at Mr. Vere Foster's cost.

Shirkin Island vested school.

In this wretched building over 100 boys and girls have been assembled daily for twenty years. I then made for Shirkin Island, and expected nothing better than I had found on my way in the morning, considering the poverty of the place. But I was agreeably surprised to find a neat, well-built structure of ample dimensions, in good repair, and well lighted and ventilated, in which the girls were taught. Had there not been a resort to Government aid, in all probability the children would have been taught in some such wretched hovel as that at Baltimore. So far as the building is concerned, I should not care to see anything better anywhere. Decent, well-kept offices are provided as well.

V.C. school at Couscroneen with Kilmacabea National school.

405. Much the same state of things was observable in the non-vested school, in the village of Leap, Kilmacabea parish, when compared with the little school at Couscroneen vested in the Commissioners. The building, indeed, at Kilmacabea was superior to that at Baltimore, but could not bear comparison with the vested school. In the latter not only were the structures good, but the internal arrangements also bore all the marks of care and frequent supervision. The desks, instead of being dilapidated and disfigured, were sound and intact, and were firmly set in their places—a rare thing in the National schools—and the forms were sufficient in number. I did not see a broken pane of glass in either of the buildings. But the children attending them are not exceptional to the general run, and are quite as mischievous as those attending other schools, and do as much damage I have no doubt. The damage, however, if any is done, is promptly repaired, upon being represented to the officer of the Board of Works, who, besides, pays, I believe, a periodical visit to all vested schools at intervals of three years.

Vested schools not increasing;

406. These buildings, however, have not increased of late nor are they likely to increase, so determined is the clerical body to remain aloof in every possible manner from the National Board until some modification is made in its present system. I met a parish priest whose district is not far from Skibbereen, who informed me that the roof of his school was fast falling in, to repair which he was begging aid everywhere. He would take Government aid he said, but it would be going against the bishop's injunctions to do so. The feeling is against accepting aid of any kind from the State under existing circumstances, so that it is out of the question to attempt to build even schools vested in trustees.

bishops and clergy oppose them.

The Catholic Bishops of Cork and of Cloyne are both emphatic in their expressions of determination to stand aloof from all connexion with the Board of Education beyond what is absolutely necessary. Priests, here and there, would gladly improve their school-buildings, if they could, by means of Government aid, but they cannot, they say, as things are now. One parish priest, whose name I must not mention, hard put to about his schools, applied for aid, keeping, however, the fact, I believe, as much out of the bishop's knowledge as possible.

Schools vested in trustees. Number and localities.

407. The schools vested in trustees are very few. I saw only four such. They were in the towns. One in Cork—the Sundayswell School—is the oldest National school in that city, and one of the oldest in that part of Ireland, having been built thirty-three years ago. The others were in Queenstown, in Kinsale, and in Skibbereen.

Buildings good.

No buildings can be better as regards solidity, height, area, and provision for light and ventilation than these schools are. I do not, indeed, think their shape so well adapted for good organization and discipline as they might be, but they were erected at a time when opinions about such matters were different from those which prevail now, and the question is concerning their general fitness for the purposes they serve. The lesser

* The letters V.C. and V.T. refer to the schools vested in the Commissioners of National Education and in Trustees respectively.

repairs are not perfect—windows are frequently out, the flooring is sometimes bad, and the offices, with which all these schools are supplied, uniformly bad—badly drained and ill-constructed, and always filthy. The Sundayswell school comprises two departments for boys and girls, the girls being above and the boys below, but as there is no greater separation between them than the thin flooring of the former room, the noise from the girls' school is very distracting. They may have become accustomed to it, but to me it was simply intolerable. No one seems to have even thought of it as a defect. I am sure it would not be allowed to go unremedied in England very long. Parochial funds, supplemented by State aid, were the sources from which the necessary sums were obtained to build these schools, which are held in trust generally by the parish priest, his curate, and a layman. In Skibbereen, I found that the bishop was one of the trustees of the school there. I was quite unable to discover any particulars respecting the renewal of the trust deeds, or the re-appointment of trustees. Repairs imperfect.

408. Twenty-seven schools non-vested were visited by me. They may be classed as follows:— Non-vested schools.

1st. Those built expressly for school purposes.
2nd. Those not so built, but fairly suitable.
3rd. Those wholly unfit.

409. In the first class, we have all the conventual schools, with one exception—St. Finn Barr's convent school—and certain other schools, in town and country, amounting in number to about fifteen, all of which may, on the whole, be said to be good as regards size, height, thickness of walls, light, ventilation, &c., &c., such as St. Patrick's school in Cork, Passage West boys' school, the school at Ballinspittle, the Carmichael schools in Cork, the nuns' school at Queenstown, and those at Kinsale and Bandon. Condition of buildings of first class.

410. The state of repair in these buildings varies considerably. The nuns' schools are all in good order; for, being the property of the convents to which they are attached, care is taken to keep them so. They are also well lighted, and fairly well ventilated and furnished. The Presentation Monks have large schools in Cork, which were built as such, and are, on the whole, well kept, and do not present any great defects of air or light, except in the case of the infants' room in the Douglas-street schools, which is as badly ventilated a room as I ever saw, considering the size of the buildings. These establishments are supplied with good offices, which are, besides, well kept—a thing not to be lost sight of in educating the poor.

411. The schools taught by secular teachers are of various grades of excellence. In one place, where the buildings are nice externally, good ventilation has been sacrificed to Gothic windows and a high-pitched roof, and the importance of keeping the two departments out of hearing, as well as out of sight, of each other has not even been thought of. I allude to the pretty-looking National schools belonging to the Presbyterians in Cork, known as the Carmichael schools, which are badly ventilated, and have merely a green baize hanging curtain separating the girls from the boys, whose cries of pain under the rod, and buzz and murmur of lesson-learning, and heavy tramping as they were marshalled in classes, were a sore hindrance to me while I examined the girls. The repair of this building was excellent.

412. The St. Nicholas school buildings, Cork, were not built as such, but being large enough to meet the wants of the parish, and close to the church, were rented for the purpose; they are, therefore, as to shape and commodiousness, not so good as many other National schools, but fairly answer their present purpose. Exception must be made in favour of the two infants' schools which are of a better style, being more like school-rooms than dwelling-houses, and if the two departments were thrown into one would make a very good school-room. St. Nicholas' schools, Cork.

413. Those buildings which were erected especially for educational purposes were put up at the expense of the parishes in which they are situated, and were built on a liberal scale, being, as I have before said, well lighted and ventilated, and spacious. The school-house at Ballinora is an exception to this general rule. It was never originally well built; it is deficient in length and width, and so affords little room for moving about, and is poorly ventilated. The minor repairs of these buildings are as a rule deficient, which gives a look of untidiness and disorder which, without more careful examination, would lead one to form an exaggerated opinion of their general condition. A very small yearly outlay would keep them in good repair, and give them a better appearance than they now wear. It is not unimportant as regards the education of the children, in the broadest sense of the word, that the rooms in which they are taught should be kept in good order. Schools built at expense of people. Minor repairs bad.

414. The desire to establish schools without going to the expense of building, or the actual inability to raise funds, led to a system of make-shifts as regards accommodation, which, while in the minority of cases they were adopted with sufficient regard to the essentials of a school, were, in the majority of cases, more unscrupulously resorted to, an abuse greatly owing to the over-leniency of the National Board in enforcing its regulations, itself, I have no doubt, attributable to a desire not to give any more cause of annoyance to the clergy than was absolutely necessary. With three exceptions, all these buildings had been dwellings of different kinds, ranging from town-houses to thatched cabins; two had been chapels. I saw only four buildings of this class to which I should, in England, be able to recommend the payment of annual grants in support of the schools taught in them. Two of them, however, just came within the margin and no more, and, with one exception, all would be required either to improve the drainage, or supply proper furniture, or make provision for warmth during the winter. In the school at Cloyne, the centre of a thriving district, the children are kept away from school during the winter in consequence of the absence of any provision for warmth. In the girls' school there is indeed a stove, but it is too small to do much good in a large room with a high-pitched roof too thin to keep out the cold, which finds its way in, besides, through the chinks which seemed to abound in the walls. The mistress assured me that it was miserable during the winter. This absence of provision against the winter is very generally complained of. Condition of buildings of second class.

415. The SS. Peter and Paul National schools in Cork are held in a house in the heart of the city, the girls occupying the first floor, and the infants the second. The rooms are of a most inconvenient shape, although possessing air and light sufficient, and the drainage appears to be very bad. The mistress informed me that the smell was sometimes intolerable, and had a bad effect on her health. There is no play-ground, and the infants have their recreation on the dark stairs. One of the managers told me that they meant to build in time, but as more than one school generation has passed through them since their establishment, it is not improbable that more than another generation will pass through them again before the contemplated step is taken. The school-house at Castlemartyr is a neat-looking building, and is kept in good repair in every respect, but is wanting in ventilation, the windows being insufficient. SS. Peter and Paul schools. Castlemartyr.

416. The only convent school buildings which I found unsuited to their purpose were those known as St. Finn Barr's convent school in Cork. Nine rambling rooms, formerly inhabited by the nuns, are now packed with an average daily attendance of 645 girls; there were present on the occasion of my visit 670. The rooms are all low-roofed, badly ventilated, and situated on different floors. I did not see one in which there was space enough to move freely about, the girls being huddled closely together on the long benches which St. Finn Barr's convent schools.

reached almost from wall to wall. One room, in which there was space sufficient to accommodate only 30 girls, had as many as 50 at work sewing when I passed through it. There is no adequate provision for the infants, who are located in two rooms, one of them being badly lighted, and the other, although spacious enough, is unconnected with any part of the school, is badly furnished, and is left for the most part under the supervision only of a little monitress. The number of pupils enrolled on the books of the school was in July, 1868, not less than 1,228.

Condition of buildings of third class.

417. Some of the non-vested school buildings are wholly unfit for their purposes. Indeed, the majority of them should be condemned by the National Board, and be continued on their books only on the condition of the managers undertaking to build new schools within a given time. I have described above two of these miserable places. I must not omit to notice two more, one of them situated near Cork, and the other near Kinsale, and known respectively as the Clogheen and Belgooley National schools. They are both thatched and unfloored, with insufficient space, no ventilation, and badly lighted. The Clogheen school is about three miles out of Cork to the north, and is situated in the district of which the Catholic cathedral is the parish church. The parish contains two large Christian Brothers' schools and three nuns' schools, all of which were erected free of cost, at least as far as the parish was concerned, and are maintained independently of any assistance from it, so far at least as I know. Only one school has been erected in that district by the direct action of the clergy—that at Blackpool. I am therefore puzzled to conceive how the school at Clogheen has been allowed to continue in the present building, as it has for several years. The Inspector informed me that he had remonstrated, and was met by promises to do something in time. The building at Belgooley is of the same kind, but worse if possible than the other. But no step is taken by the parish priest towards building another, nor does the National Board do more than threaten. I cannot refrain from mentioning the Bandon National school. The building was a house, but being too small and having two floors, the ingenious device was hit upon of cutting away half the flooring of the upper storey, which thus became a deep gallery, into which the children ascend by a steep ladder-like flight of steps. It is conceivable how good the discipline of the school must be. There is no good National school-house in a town of nearly 7,000 inhabitants.

Class-rooms.

418. I saw very few class-rooms in the buildings I visited, and they were chiefly in the schools taught by "religious." In the ordinary National schools they are rarely seen. I came across only two schools which had them. A good sized room opening out of the principal school-room would, in places where separate infants' departments cannot be had, be very useful, as it could be used for the younger children, whose presence among the elder children is a hindrance to instruction and good discipline more or less.

Out-buildings, offices. Offices common but bad. In non-vested schools often none.

419. In no instance did I meet a case of any outbuildings, except the offices, connected with the schools. Offices are in the majority of cases to be found in every school, but their drainage is, for the most part, defective, their structure imperfect, and their filthiness excessive. In several cases of non-vested schools no offices exist at all—witness Baltimore, Clogheen, Belgooley, Midleton infants' school, all of which are without them, although they are mixed schools.

Schools not connected with Board. Christian Brothers'.

420. Among the school buildings not connected with the National Board we have the Christian Brothers' schools, and one monks' school, the nuns' schools, and the schools in connexion with the Church Education Society. I visited four schools of the Christian Brothers, and found admirable provision made in every case for decency, comfort, and health. The rooms are without exception good, and in thorough repair; and every care is taken to ensure ventilation, light, and warmth. The buildings have more architectural pretensions than any others, and are sufficiently substantial to last for many years. Their interior cleanliness and good order contrast very pleasingly with the condition of the National schools. The best offices are found in them.

Nuns.

Very much the same may be said of the nuns' schools, which are all new, with one exception—that of the North Presentation Nuns—and have been built with a careful regard to modern improvements. The buildings not long since erected, and attached to the convent of the Sisters of Charity of the Irish Congregation, are as fine as any I have seen anywhere; and I believe I may say that the infants' room is the finest I have ever seen. Similarly the schools conducted by the Sisters of Mercy, and known as Our Lady of the Rock, are worthy of much commendation—they were erected at a cost of about £3,000 not long ago, chiefly through the exertions of Mr. Hegarty, a magistrate of the city of Cork, whose benevolence and interest in the cause of education are well known there. All these buildings are on a vast scale, and it is a debatable question whether very large schools are the best, but that is distinct from their excellence as buildings.

Church Education Society.

421. The greater number of the school buildings connected with the Church Education Society, are, if not good, certainly beyond the reach of such censure as many of the non-vested National schools merit. The schools in the towns of Cork and Bandon were built expressly as such, and are spacious, and in most respects good. They are, however, out of all proportion to the numbers which attend them, and seem to have been erected at a time when the Protestant body was more numerous in that part of Ireland than it is now, or with a view of being able to accommodate any accessions to their body they might gain; otherwise, I am wholly unable to understand the anomaly of having rooms large enough to contain more than, in some cases, six times as many children as attend them. In the Bandon girls' school there is accommodation for 350 children, allowing 8 square feet of space to each child, but the average attendance does not exceed 40. The St. Luke's Scriptural schools could contain in its 3 departments above 300 children, but its daily average attendance does not exceed 88. The schools in the country districts are of course larger than the requirements of education demand. On the whole they are tolerably good, and are kept in fair order, but are not always supplied with offices. In several cases the teachers have houses attached to the schools. In three instances the school-room is in the house. They are not always supplied with offices.

Furniture, fittings.

422. As regards furniture and internal arrangements generally, the Christian Brothers' and the newer nuns' schools stand first; the schools vested in Commissioners stand next; and the other National schools of all kinds, as well as the Church Education Society's schools, stand last. Furniture consists, of course, of forms, desks, a rostrum for the teacher, and cupboards. There is in all schools, except some of the smaller National ones, a sufficient number of forms to seat the whole school at once, but where area is wanting the "bipartite system" is resorted to, that is, half or one-third of the scholars are engaged in some lesson which requires standing, while the other division is sitting. I regretted to notice an absence of any separate seats for the assistant teachers in the National schools, which drives them to sit with the children, and thus breeds a too great familiarity between teacher and scholars, and destroys the influence of the former. The Christian Brothers have a good plan of providing in their upper rooms a small rostrum, or seat, in a corner of the room, for the senior monitor, which gives him a distinction, and helps him to maintain his authority.

Condition of furniture, apparatus, &c., &c.

423. The furniture in most of the National schools is old and rickety and clumsy. The desks are mutilated and disfigured; they stand frequently unsteadily, and are not unfrequently broken, while the forms are little better. There is no cupboard besides the one in the master's rostrum, which is generally not overstocked with anything. Ink-pots are scarce, the children bringing when they can small bottles of ink, and borrowing or

going without when their own is exhausted. The schools of the Christian Brothers and other religious in all these respects contrast very favourably with the National schools. There is no influence in these last to remedy all this by putting them in a better way. The schools of the "religious" have the influence of superior social habits brought to bear upon them, whereas the National schools are quite beyond the pale of such influences, being isolated entirely from the social life of the country. It is a thing greatly to be desired that such a relation could be brought about between the schools of the nation and its people of all classes as would benefit both.

Monitors.

Different classes of monitors.

424. Monitors in the National schools stand very much in the same position as our pupil-teachers do in England, inasmuch as they form part of the teaching staff, and, like them, are subject to examinations, and are paid for their services, but differ from them in not being apprenticed for any term of years. Monitors are for the most part divided into two classes of senior and junior monitors, who are paid at different rates. There is also another class of monitors known as first class monitors, but they are quite exceptional. They are luxuries which are allowed to large and highly efficient schools, and do not seem to be employed in them because of any need for more efficient teachers, but as a kind of reward for the generally good condition. I saw one such in the girls' school at Castlemartyr, which, for an average attendance of 87 scholars, was provided with two certificated teachers, and the first-class monitor above mentioned, with a salary of £15. All the other first-class monitors I saw were in the convent schools, which are allowed them, owing to their numbers alone, I should think, and not to their efficiency. Organized schools are supposed to have a set of unpaid monitors, for whose instruction the teacher receives a gratuity, but as the rules concerning organized schools appear to be falling into disuse, I saw only one school in which they existed.

Numbers of monitors in ordinary and conventual National schools.

425. In the ordinary National schools I found 38 monitors, and in the convent schools 73. The great size of the latter accounts for their employment in greater numbers in them; but there is also a great tendency among the Inspectors, who have practically the power of appointing monitors, to allow the nuns as many as they can, to compensate, probably, for the small remuneration they receive from the National Board. In the ordinary National schools they are fewer, owing to the large number of certificated teachers employed in them, which thus renders the appointment of monitors needless. In these schools—at least those which I visited—junior monitors prevail, owing to the majority of the teachers being of the lowest classification. As regards the supply of monitors, a distinction must be made between girls' and boys' schools, and between the town and the country. In the towns, the boys can do better than by becoming monitors, and there is a difficulty, therefore, in getting them. One teacher at Queenstown told me that the boys could get more there by running errands and doing odd jobs, and would not, therefore, offer themselves for the post; and in the case of a better class of boys, their education would insure them, at the outset, as much as they would receive after four years of service as monitors. In the country, the boys are not, however, much more ready to become monitors, as farm labour is becoming more remunerative, owing to emigration. There is much greater facility in getting girls to offer themselves, and the difficulty in the ordinary schools is to get them appointed. In the nuns' schools, I have observed that they are more numerous, as girls offer themselves in greater numbers, owing to their attachment to the nuns, and to the facility with which they are appointed by the Inspectors. They are appointed by the Inspectors, with the managers' approval. The teachers pick out the most intelligent children, and in some few cases determine whom to recommend to the Inspector by competitive examination. But there were not more than three instances of that method in all the schools I visited.

Supply of monitors.

Method of appointment.

Their utility.

426. Of their utility in helping the teachers there can be no doubt, since they relieve them of the drudgery of the lower classes, who are invariably taught by them. The convent schools would be unable to get on at all without them. But of their real efficiency as teachers not much can be said. The junior classes in all the National schools are the worst taught, and the instruction throughout the convent schools is inferior. They are not to be blamed for this; they would do better if they were themselves taught better, but that will not be until the teachers themselves are made more efficient.

Their general efficiency.

427. I did not examine any monitors, except at the convent school at Kinsale, where I found them very efficiently taught. I am unable, therefore, to say anything as to their acquirements generally. They are certainly very much more intelligent than our pupil-teachers in England, and are, as they have in all cases been long at school, and have derived whatever benefits a National school can bestow, probably better instructed than, although not so systematically drilled as, the English pupil-teachers are. The girls are always respectable, and, indeed, superior in manner and dress to the children, particularly in the convent schools, where the general tone is higher than elsewhere. Most of the mistresses have been monitors in those schools, and have carried out into life with them the good they got there; and the monitors who come in contact with them in the secular schools have thus a better chance of becoming morally improved. The boys have in most of the schools but few such chances. Their teachers have never had any opportunities of becoming educated in a wider sense than acquiring a knowledge of the subjects which they must know in order to become qualified to teach, and they consequently have no higher models to copy from, and remain as they were when only scholars. They have no authority and command no respect.

Monitorial system might be made more efficient.

428. Much might be made of monitors in Ireland. They might be employed more numerously, and with better results as regards education, and lessen expense by reducing the number of certificated teachers, who are not, as a rule, so useful in teaching the merely elementary classes, and are not so easily made to work in concert with the principal teachers. Their employment would, besides, furnish a well prepared supply of candidates for the training schools, which would be a great advantage in every way. But it will be necessary to hold out inducements, especially to boys, to become monitors, in the shape of better pay than they now receive, with the prospect, besides, of remuneration sufficiently high to put their future employment as teachers on a level with the general run of occupations in which they might find employment. By fixing a scale of salaries for monitors adjusted to the rates at which juvenile labour is remunerated in Ireland, it would be, from what I could gather, not difficult to get a sufficient supply of boys and girls to become monitors, the majority of whom would not eventually become teachers, but a residue would be left who would form the material from which the teachers of the country might be taken. To make such a system effective, there must be trained teachers in the schools, who would be able to educate, and direct, and elevate the raw youth who would become monitors; and it would also be necessary, in order to secure some certainty of their continued employment, to introduce a system of apprenticeship for a term of years. The employment of monitors would be economical, as it would, by rendering the employment of so many certificated assistants unnecessary, at once reduce the expenditure in salaries to teachers, and render the cost of maintaining training schools less heavy. In England assistants are the exception, while pupil-teachers are the rule; and the schools, which are taught by well directed pupil-teachers, are quite as, if not more, efficient than those in which assistants are employed. They, without doubt, do the drudgery better.

429. Imperfect as is the monitorial system in the National schools, it is, nevertheless, the only one which at all approaches to being well organized. Recognising the monitors as teachers, the National Board endeavours to insure their efficiency as such by testing their qualifications by examinations, increasing in difficulty as their period of service lengthens. The schools of the Church Education Society may be excluded from these observations, as they employ monitors very rarely. I desire to say a few words about the monitorial system in the Christian Brothers' schools. They employ monitors in their schools, but they are unpaid, and thus, at the outset, they have no hold over them. There is no obligation on the monitor binding him to the observance of certain rules, and to the discharge of fixed duties. He is not obliged to study himself, or to attend for instruction at fixed hours; he has no examinations to undergo, and is in all respects perfectly free, while the Brothers themselves are equally free from any obligation to instruct him. The consequence of this is, that the bulk of the monitors are not more advanced than the children whom they teach. If the Brothers could afford to pay their monitors, the condition of things would be very different, and one would no longer see boys acting as monitors who are only a division of a class in advance of those whom they are engaged in teaching. It is curious to go into one of their schools and observe their monitorial system. It is visible in its most inefficient form in the lower classes. On going into a room in which the boys in the First Book are taught, if it is the hour for reading, 9 or 10 divisions consisting of 8 or 10 children may be seen ranged down each side of the room in semicircles, opposite an alphabetical or reading card, and round a little boy probably not older than the rest, and whose educational superiority to his pupils cannot be measured by more than a few pages of the lesson book they are themselves reading. The Brother in charge of the room goes from one division to another in turn, superintending personally, therefore, only one-tenth of the pupils at once, the remaining nine-tenths being left to the little monitors, who, it is no disparagement to the good discipline of these schools to say, spend half of the time either in the listlessness or the activity which are peculiar to boys of that age. They cannot possibly concentrate the attention of the others on their work, and most frequently join in the distraction which seizes their little minds. In the upper classes the arrangements are better, since a certain number of boys of a higher class are kept in each room, and receive special instruction from the teacher; but still they are only scholars, and as such have not sufficient weight. I am not surprised at the poor results in the lower classes under such circumstances. One of the advantages which the Christian Brothers would derive from a connexion with a good Government scheme of education would be the means they would then have of strengthening their teaching staff by employing efficient monitors. At present they are driven to employ multitudes of unpaid assistants, but are hardly benefited at all by them, owing to their inefficiency. The Brothers are not unconscious of this defect in their system, and would, if they could, willingly remedy it.

Monitors in Christian Brothers' schools.

School Management.

Schools entirely managed by the clergy.

430. The management of the National schools and those of the Church Education Society is generally in the hands of the clergy. The only exceptions to this rule are a few schools in connexion with the National Board belonging to the Established Church, and two Presbyterian schools which are to some extent under the joint management of the laity and clergy, and two of the Church Education Society's schools, in Cork, which are similarly circumstanced. The ordinary National schools are exclusively in the hands of the clergy, as are also the majority of those of the Established Church, while the convent schools are managed by the superiors of the houses to which they are attached. Lay influence is consequently entirely unfelt in the educational affairs of the country. I know of only two laymen who are patrons of National schools, but their patronage is merely nominal, as they take no active part at all in their management. I refer to the Sherkin Island boys' school, which was erected partly at the expense of Sir H. Beecher, bart., who, however, does no more than find the money occasionally for its repair, and to the Sundayswell school in Cork, the land for which was given by Lord Cork, with an endowment of £10 a year towards keeping the building in repair. His agent is nominally patron of the school, but is quite passive.

Causes.

431. This exclusively clerical system of school management arose very naturally out of the obvious appropriateness and even necessity, under existing circumstances, that the education of the youth of the country should be visibly connected with religion, and be directed by it more or less. The fact of the schools having been originated by the clergy threw them more exclusively, and almost as a matter of right, into their hands. And when the National Board permitted non-vested schools, the rights of proprietorship over the school buildings still further consolidated their influence as managers. What has been the result of such an exclusive power of management? It is fair to ask the question, for the position of a manager, if it carries with it privileges, also entails duties upon its holder. The local management of schools is the expression of the principle of providing for education by the joint action of the State and of society locally, and of the feeling that all classes would mutually benefit by the connexion which would be created between them by the action of that principle. The interest of the better educated classes would be excited in favour of the institutions to whose support they might contribute, and their personal influence brought to bear upon it with beneficial results. The managers as representing society in their localities, assume the responsibilities of raising money, of keeping the buildings in good repair, of furnishing books, apparatus, &c., of visiting the schools with the view to stimulate exertion among the teachers and scholars, and to develope the civilizing and moral power of the schools to their fullest extent.

Duties of school managers.

Very imperfectly discharged in Ireland.

432. Such, in outline, are the duties of a school manager in England, in return for which he has the privilege of appointing or dismissing the teachers, of directing their conduct as he may think best for his school, and of exercising unrestrictedly his will and judgment in every matter, provided they do not interfere with the general regulations of the Committee of Council. Such, too, are the duties and the privileges of an Irish manager of National schools. But while in England they are discharged more or less fully—since upon their discharge the very existence of the schools depend—in Ireland it is not so, owing, I admit, very greatly to its different circumstances of society as regards population and wealth, and to the principle on which schools are there supported. Nor must sight be lost of the numerous duties which devolve upon the managers of National schools in their capacities of pastors. Their number is small, their flocks numerous, and their districts extensive, and they are, therefore, perhaps, hardly able to accomplish more than what falls strictly within the limits of their duties as priests. But be that as it may, the whole extent of a manager's action at present is to appoint the teachers and monitors, to pay them their salaries, and to convey to them any communications they may receive from the National Board. After the school is opened the manager's responsibilities cease. He is unaccountable for its efficiency in any way. No unbalanced accounts press upon him, no deficiencies have to be made up. The teacher is responsible for books and apparatus, and sometimes is obliged to repair the buildings. The school is visited by the manager, sometimes frequently, more often rarely, but nothing turns upon his visits. He does not trouble himself much about the progress of the scholars, for that is the master's concern, nor is he careful to make the school attractive by affording the means to make it comfortable and warm, and by adopting systems

of rewards for regular attendance and proficiency. No examinations are held by him, nor does he, as a rule, attend when the official inspection of the school is made. The people are not interested in them by statements of their condition and progress from the pulpit, and so the schools are left isolated. As a rule, the managers of the Roman Catholic schools never give any religious instruction, which is left to the teachers. It would give a great impulse to education, if some plan were adopted which would have the effect of producing such necessary interest in the schools in the minds of school managers as would bring their influence into direct action upon them. It is no disparagement to our English managers to say that much of their interest in the condition of their schools is in consequence of their responsibilities about them. Now, although I do not think it possible to introduce the entire system of the Revised Code into Ireland, as the country is too poor, I do hope, notwithstanding, that the managers of National schools, if they are granted a denominational system, will have to assume more responsibility than they have to bear under the present system. And first of all, they should relieve the teachers of the burdens which are now most unfairly imposed upon them, such as the purchase of books, of apparatus, the repairs of the buildings, &c. They should also be made to carry out the regulations regarding the necessity of suitable buildings, good furniture, grates and fittings, and good out-offices. But this will only be effected by making the payment of grants conditional upon carrying out certain stipulations, and upon the efficiency of the instruction of the schools as tested by individual examination. I have found that wherever the managers interest themselves true efficiency is more or less to be found. The schools of SS. Peter and Paul, in Cork, are instances of the happy effects of good management, as are also the St. Nicholas' schools in the same place, and much of the regularity of the children in the Church Education schools must be set down to the zeal of the clergy who manage them.

Education would benefit if managers took more interest in schools.

433. The entire absence of any lay element in the management of the National schools is very much to be regretted, but I do not see any probability of its introduction. It is only in the towns that persons at all competent could be found, but I doubt whether it would be possible to get the clergy to act with them on equal terms. So long as the lay manager happened to agree with the clerical, things would move harmoniously, but if differences of opinion were to arise, I fear the Church would be somewhat uncompromising. Indeed I do not think the Catholic clergy would care to have any active lay management in the schools, and the most acceptable form it could take would be the limited one of subscribing to the schools. In the country, there are, as a rule, no lay Catholics of sufficient intelligence or position who could act as school managers. The landowners are the only persons who could, but they are for the most part Protestants, which at once renders their co-operation with the Catholic clergy almost impossible. What difference a denominational system might make in this respect I cannot pretend to say; it might modify the estrangement, but recollecting the intensity of Protestant feeling in Ireland, I own I should not expect any very great difference. People who consider not only the Catholic theology as wholly corrupt, but its teachers as more or less demoralized by it, are not likely to be willing to act with them in helping on the education of Roman Catholics in schools in which the instruction is based upon the principles of their Church.

Lay influence desirable, but not practicable.

Inspection.

434. It is beyond controversy that the only means by which any great system can be rendered uniform and efficient in its action is by its being subject to the supervision of a central power through officers appointed by that power which is called inspection. And the benefits derived from such a system will be in the ratio of the excellence of the regulations laid down, and of the strictness with which they are enforced. Both these are essential points, since good regulations will remain fruitless unless they are enforced, and strictness will not make up for any radical deficiency in the rules. Now the National system of education in Ireland possesses these two instruments of efficiency. It has a code of regulations, and a staff of officers to enforce their observance. What are the results produced? I would refer to those portions of my report especially which treat of teachers, of school buildings, of registers, of instruction and discipline, and of the observance of the regulations of the Board of Education. From them it may be gathered that while the teachers are diligent and punctual in the discharge of their duties, and are careful in keeping the school records, and the general regulations are observed, the instruction of the schools is not as satisfactory in the lower classes as it should be, and time is wasted in them; discipline is bad; the buildings are either neglected or wholly unfit for their purposes; and the books are in many cases deficient as well as other requisites. Now these are the special points upon which inspection is meant to bear, and it appears that the most important of them are not in as satisfactory a condition as might be expected. There is a want somewhere. Is it in the officers or in the regulations themselves? I believe it to be chiefly in the latter, which are negatively defective, in that they make nothing, or not enough, to turn upon the reports of the Inspectors. This is particularly observable in the condition of the buildings and of the discipline and instruction of the schools. Correct reports are, I take it for granted, made, but nothing is done, no penalty is incurred, if they are unfavourable, and so the evils of dilapidated buildings devoid of appliances for maintaining decency, of bad discipline, and moderate instruction are perpetuated year after year. The grants, too, taking the exclusive form of payments for teachers' salaries make it still more difficult for the central authority to act, since the sufferer would be the teacher, who, paid already at the minimum rate at which living is possible, could not bear any deductions from his pay.

Results of inspection of National schools moderate.

Rules of Board not stringently enforced.

435. With respect to the effect of inspection upon the instruction of the National schools, my impression is that it does perhaps as much as could be expected. It certainly has the effect of keeping up a definite programme of study, and that to a certain extent does good. But it fails to produce a thorough efficiency throughout the schools, for the examinations of the lower classes are not reported upon with sufficient minuteness, and there is too great a tendency to make the highest class the index of the proficiency of all the others. And again, no notice appears to be taken generally of the long periods of time spent in the lower classes, nor is the almost universal absence of any marks of proper attention to the children in the lowest class noticed sufficiently seriously. If the schools were paid by results obtained upon individual examination of the scholars according to fixed standards, the Inspectors' reports would better represent the general condition of instruction than they do now. Most of their observations which I read were wanting in sufficient regard for the humbler parts of the school, and dwelt too much on the brilliancy of the upper class. As compared with our English method of inspection, the Irish system is superior in so far as it may be considered more efficacious to visit schools without notice, which, of course, keeps the teachers in a constant attitude of preparation, and, therefore, of efficiency, so far as being at their posts, and having their school at work, and observing regulations, are concerned, but in all other respects it seems to fall below it.

Instruction not fully benefited by inspection.

Individual examination needed.

436. Much of the value of inspection depends upon the individuals who are employed as Inspectors, and its *morale*—not its least important aspect—rests very much upon them. Their influence reaches to the teachers, and through them to the children, and may do much good or may do harm. It is difficult to estimate exactly the direction of this influence in the National schools, because the Inspectors labour under the disadvantage of

Moral value of inspection.

having teachers to deal with who have had none of the advantages of sufficient intercourse with persons more cultivated than themselves, and are, consequently, not so sensitive to the highest influences as would make their contact with the Inspector beneficial to them. But I could see very few traces of such influences. The manners, ways, and general tone observable among the teachers did not convey to my mind that they had been for years in contact with courteous gentlemen; they did not seem to comprehend that one could combine all the respect and kindness due to them with the strict performance of an official duty. Nor did the scholars appear to understand a gentle tone of voice and manner; it seemed sometimes as if they could not obey directions given in such a manner. How much the Inspectors are accountable for that I cannot say, but it is certain such is the fact. I have met with only three National school Inspectors, and exclude them entirely from these remarks, as they had taken charge of their districts only a very few months before I commenced my duties. One of them I had the pleasure of seeing frequently and knowing well, and am able to testify to his culture and refinement of mind, his fine sense of delicacy and honour, and his zeal in the discharge of his duties. Many of the qualifications which are essential to the real efficiency of school inspection do not necessarily accompany the possession of the requisite amount of knowledge by the candidate for employment, which seems to be the only thing looked to (of course a good moral character is required), and so it is not wonderful that persons unfitted for such important positions are employed. The fact that the National Inspectors, as a body, stand in such small public esteem is a melancholy proof that such is too frequently the case. The masters are now more frequently raised to the position of Inspectors than formerly. If they happen to be individuals who have risen above their former habits of thought and life up to a higher level, let them by all means become Inspectors, but if they have no higher qualifications than the ability to pass an examination, I should be inclined very much to question the wisdom of allowing it. One of the means of elevating the lower classes is by bringing them into contact with people superior to themselves in refinement of mind and manners, as well as in education. But one of the conditions of success is that the superiority be visible and marked, and unless it is so, it carries very little weight.

Books.

Books of National Board generally used, and approved, except as regards their un-Irish character.

437. The books in use in all the National schools of every description are those published by the National Board of Education, which are used very generally also in the schools of the Church Education Society. Their use is not insisted upon, and managers are free to use others, subject only to the approbation of the Commissioners of Education; but the cheapness at which they are sold puts at once all others out of the field of competition, and in spite of their defects in the eyes of the clergy, they have been, and are, the means by which the children are taught. Of their general suitableness, in a literary point of view, I heard very little question; all parties joined in saying that they were so far good. It was of their un-Irish character that I heard most complaint made. The absence of any mention of Irish history in books intended to teach the inhabitants of Ireland was regarded as an attempt to destroy the feeling of nationality, and was the only feature which provoked much resentment. The last edition is, however, considered more satisfactory, but still deficient, as, while introducing Irish geography and scenery, &c., &c., it omits Irish history. In some minds there is a feeling in favour of the introduction of religion in a more definite way, but that is quite the exception. The Superior of a convent told me that she was quite content with the books, as did also the Head of the Presentation Brothers, in every way, except as regarded their nationality. The insertion in the Fourth Book of that beautiful little song "The Angel's Whisper," gave much pleasure, and its subsequent removal, together with that passage which described Queen Philippa as making the sign of the Cross when dying, provoked much resentment, principally, it seemed to me, because it was yielding to the intolerant bigotry of the Presbyterian minority.

On the whole they are good.

The works themselves strike me as good on the whole, but I should prefer to see the First Book improved, in the way of introducing more information than most of the lessons now contain. It surely is possible to combine a great variety of simple words in lessons or sentences which would convey some real idea to a child's mind. The Fourth Book is also open to the objection of being too advanced for the children who use it. The idea underlying its compilation seems to have been that the chief excellence of a reading book of that class consists in the intrinsic beauty and perfection of the selections composing it, and not so much in its adaptation to the years and intelligence of the individuals for whom it is intended. I cannot conceive how a highly metaphysical passage on the soul of man from one of Dr. Newman's sermons could be thought even intelligible to a child of thirteen or fourteen years of age.

Supply deficient.

The supply of these books in the National schools, cheap as they are, is very frequently deficient. This happens only in the ordinary National schools, the convent schools being generally well supplied, and is owing to the rule which makes the teacher responsible for their supply. I have frequently seen three boys using the same book, indeed in almost every school I noticed more or less the same want, which likewise extends to slates, copy-books, pens, ink, &c., &c. In the school at Passage West, when a boy's ink-pot is empty, if he refuses to purchase another, he is made act as a temporary monitor, and superintends the writing of the others.

Books of Christian Brothers.

The Christian Brothers compile and publish their own books, which are used also exclusively in the convent schools not connected with the Board. They are much more difficult than the National series, the Third Book being as advanced as the Fourth of the latter class, and they are fuller of interesting matter of all kinds, and combine nationality and Catholicity in considerable proportions. They are of course more expensive than the National books, but are nevertheless bought by the scholars, who, owing to their price, take much care of them, and make them last longer. The schools of the Church Education Society use indiscriminately the National school-books, those published by the Society for Promoting Christian Knowledge, and (sometimes) the venerable Dublin Spelling Book. In the same school all those different series may be seen frequently, and, as a rule, the supply is imperfect.

438. If a denominational system of education should take the place of the present one, it will be an important question to decide how far the Central Board should interfere with the books. If, as I hope, books will continue to be supplied on the present liberal scale, the matter will not be so difficult to manage, for, provided the heads of the different religious denominations are consulted in their preparation, the governing body would be left free to act as they think best. But if the grants of books are discontinued, and the composition of school-books, therefore, falls into private hands, the schools will labour under the disadvantage of having different series of books of different degrees of excellence or inferiority (which would interfere with uniformity of results), and of being unable to supply the children liberally with them, in consequence of the inability that would arise of supplying them as cheaply as the National Board now does. All classes of people agreed in saying that the publication of books by the National Board has been one of the greatest blessings to Ireland, as their cheapness put them within the reach of all. It will be a misfortune if the same facilities cannot be continued under a new system.

Regulations of the Board.

439. The rules of the National Board appear to be observed with much exactness. Those which relate to religion are the ones which would be most likely to be infringed, but I have no cause to think that they are in any class of school. In the ordinary National schools, so entirely is religion in the shape of any definite belief absent, that there is nothing to put one in mind of its existence, except the cards which contain certain exhortations to be tolerant and peaceful, and the Decalogue. Neither cross, nor crucifix, nor image, nor symbol of any kind is in them; and only in one instance did I see the cross upon a school-house—it was at Kinsale, but was put up previous to the prohibition against its use. It is not that they are concealed from view during the hours of secular instruction, as in the convent schools—they do not exist in any manner at all. In the nuns' schools, however, there is always a cross, or a statue of the Blessed Virgin, or of some patron saint, which, however, is kept as a rule in a cupboard, and is exposed only at the hour for religious instruction—generally at noon—when the card with the words "religious instruction" is suspended in the place of the other with the words "secular instruction." Regulations of National Board observed.

440. The sign of the cross is forbidden, and any—even momentary—interruption for prayer is prohibited. But a very unwilling acquiescence is yielded to these regulations, as they are felt to be meaningless and useless where there are no Protestants at all. Here and there they seem to have been disregarded, but the Board was prompt in requiring their full observance. I saw only one convent school in which the sign of the cross was made, but there were no Protestants present in the school, or enrolled in its books. The parish priest at Midleton told me that in the convent school there, attended exclusively by Catholics, the girls were at one time in the habit of stopping for a moment, and bowing their heads for the purpose of saying secretly a little prayer. The Inspector noticed this, and reported to the Board that their regulations were violated, mentioning particularly that the girls said a prayer. The Commissioners forthwith communicated to the manager their request that the practice should be stopped, as no prayer could be allowed. The Inspector had not been accurate enough, and left himself open, by stating that a prayer *was said*, to the charge of making an incorrect statement, since no words were audible. The priest was quick to taking hold of the flaw, and charged the Inspector to the Commissioners with making a false report. It was a quibble of course, but it was literally true that no words were audible, and therefore the Inspector could not correctly affirm that a prayer was said. The Commissioners felt this, and had to satisfy the priest by reprimanding their officer, but nevertheless insisted that no interruption *of any kind* to secular study should take place. Difficulties such as these are likely to arise out of the conflict between the religious feeling of the teachers and the prohibitions which the present rules put upon them. The secular teachers are not so sensitive about religion, and being more completely under the direction of the Commissioners of Education, similar complications do not arise in their schools. The Presbyterian and Established Church schools under the Board are equally observant of its rules as others are.

441. Before concluding, I would again express my deep sense of the importance of making some such change in the present system as may have the effect of drawing within its influence all classes of the community by recognising the principle of religion as the basis of education. It appears to me to be hopeless to perpetuate the present system, or to succeed in overcoming the prejudices against it which exist; for strong influences are springing up which cannot be coerced, and which may tend to widen the breach more and more between the people and the institutions of the country. And to make any system of education in Ireland perfect, it will be of the first importance to have it well officered, which can only be done by making the teacher's office sufficiently attractive to induce young men of ability to become teachers by holding out the prospect of sufficient remuneration and of advancement, and by establishing schools in which the future teachers of the country may learn their business thoroughly, and may acquire a spirit of religion. It will further be necessary, in order to stimulate the zeal of all concerned with the conduct of schools, to make success in teaching as tested by examination the measure of aid from the public purse. With these principles fully carried out, I believe the education of Ireland would be inferior to that of no other country.

I have the honour to remain, my lords and gentlemen, your most obedient servant,

Walter Scott Coward,

Assistant Commissioner.

Dublin, 28th July, 1869.

Appendix A.

Table showing different degrees of Salaries of the Teachers in—

(1.) Ordinary National Schools.

Degree of Salary.	Name of School.	District.	Class of Certificate. Class.	Division.	Average Attendance of School.	Sources of Income.	£	s.	d.
Highest Salaries of Teachers of 1st Class.	Carmichael male.	Cork, . .	I.	I.	64·7	Salary, . .	52	0	0
						School fees, .	55	1	11
						Drawing, . .	5	0	0
						Training monitors, . .	1	0	0
						Sale of books, .	0	17	10
						Good service, .	8	0	0
							121	19	9
	SS. Peter and Paul, No. 1, female.	Cork, . .	I.	I.	106·	Salary, . .	42	0	0
						Good service, .	9	0	0
						Gratuities for monitors, .	3	0	0
						School fees, .	26	0	0
						Profit on books,	1	5	0
							81	5	0
Highest Salaries of Teachers in 2nd Class.	St. Patrick's male.	Cork, . .	II.	II.	105·	Salary, . .	28	0	0
						School pence, .	22	14	4
						Manager, . .	10	0	0
						Profit on books,	1	8	7
							62	2	11
	Queen-street female (mixed.)	Cork, . .	II.	I.	37·	Salary, . .	26	0	0
						School fees, .	20	0	0
						For music and drawing, .	7	10	0
						Training Monitresses, . .	2	0	0

	Midleton Church Education Society, female.	Midleton,	I.	14·	Salary, . .	25	0	0
						25	0	0

Appendix B.

The following are a series of questions which I addressed to the clergy and other influential persons in the district which I visited; they will serve as a key to many of the letters which are printed immediately after them *in extenso* with the view of affording an opportunity to the Royal Commissioners of obtaining from the writers' own words their views with respect to the subjects on which I addressed them:—

Offices of Primary Education Commission, 46, Sackville-street, Upper,

Dublin, ——— 1868.

Reverend Sir,—I have been deputed by the Royal Commissioners of Inquiry into Primary Education in Ireland to conduct certain inquiries in this district with respect to the practical working of the system of National Education, and the state of opinion that exists amongst all classes of the community concerning it.

I am now in for the purpose of performing these duties.

And as you are one whose position and influence must render you well acquainted with the general opinion of the public, I venture to ask you to be so kind as to state your own, and what you consider to be that of the public in your neighbourhood, on the following points:—

1. The present working of the National System—whether satisfactory in itself, and in relation to the question of the expenditure of public money upon it.
2. The means of education for the wants of your neighbourhood—whether adequate or not.
3. If insufficient, best measures, in your opinion, that should be adopted to supply the deficiency.

N.B.—Please state here whether you consider that much, or anything, may be expected from local sources.

4. If the means be sufficient, but not used by the people, what can be assigned as sufficient causes—*e.g.*, are the masters competent? are schools too distant from their dwellings? *religious* and conscientious scruples, poverty of parents, &c.
5. Is the supply of *efficient masters* equal to the demand? If not, what are the causes; and state your opinion as to the best means of remedying this.
6. Is the employment of mistresses in boys' schools, or in mixed schools, *i.e.*, in schools in which both boys and girls are taught, regarded with favour in your neighbourhood?
7. Is gratuitous education prevalent, and is it beneficial?
8. Is there a lively interest taken by the upper classes in the subject of education? Do they take an active part in the general management of the schools? Would it be advisable?

Upon these, and upon any other points that may relate to this inquiry, and concerning which the expression of your opinion may help to enlighten and assist the Commissioners in forming a just estimate of the needs and wishes of the country regarding the important subject of Primary Education, any information that you may be able to give me will be received most gratefully, and will, let me add, be treated, with confidence wherever you indicate a necessity for doing so.

If you are not able to reply immediately, may I beg you to address to me at

Royal Commission of Primary Education,
46, Upper Sackville-street, Dublin.

I have the honor to be, Sir, your obedient servant,

W. Scott Coward, Assistant Commissioner.

Ministers of Different Religious Denominations.

(1.) Established Church.

From the Rev. Thomas E. Evans, Rector and Prebendary of Inniskenny, Diocese of Cork.

I do not consider the National system of education satisfactory. Five young persons members of my congregation attend unwillingly at a National school in the neighbourhood (called the Ballinora School), and when I applied to the Commissioners for authority to teach them the Holy Scriptures in the school and at such times as would not interfere with the appointed hours for secular instruction, they replied that they could give me no such authority, although I am the rector of the parish in which the National school is situated, and the reason assigned by them was that the school was under the patronage of the parish priest of Ballincollig, and that he consequently possessed the entire control over it. I beg to recommend that pecuniary aid be granted by the State to the parochial schools of Ireland, connected with the Established Church. The parochial school of my parish, Inniskenny, diocese of Cork, is conducted by two ladies who attend daily, and voluntarily devote to it a great deal of time and attention, as we cannot afford to employ a paid teacher, such a one at least as would be efficient and desirable.

(Signed) Thomas E. Evans, Rector and Prebendary of Inniskenny, Diocese of Cork.

From the Rev. Louis Perrin, Rector of Garrycloyne.

Blarney, September 19, 1868.

Sir,—I beg leave to acknowledge the receipt of your communication of the 12th inst., and to apologise for my delay in replying to your queries. Before answering them I desire to mention that in this neighbourhood the very far greater portion of the population is Roman Catholic, and that the patrons of the National schools are in most cases Roman Catholic clergymen. I now proceed to answer your queries in order:

1. The present working of the National system in this neighbourhood seems to me satisfactory both in itself and in relation to the question of the expenditure of the public money upon it.
2. and 3. The means of education are in a great measure adequate for the wants of the neighbourhood, yet the schools might with advantage be increased, as many children are at a long distance from the nearest school; I think vested schools might be established in many places; there would, however, be probably a difficulty about local aid. I, at the request of my Roman Catholic parishioners, contributed about seven years ago, the necessary third part required by the National Commissioners as the condition of building a vested school-room in a district of my parish; it was built and there was a very large attendance of children, but within half a year the children were forbidden of the Roman Catholic clergyman to attend it, because (the head master being a Roman Catholic) I appointed a member of the Established Church as assistant master, there being two pupils belonging to that Church; the school-house has since that time been shut up and unused.
4. Has in effect been answered above.
5. The supply of efficient masters is, I think, equal to the demand.
6. There are no mixed schools taught by mistresses in the neighbourhood.
7. There is some gratuitous education, but in most cases the children pay.
8. There are very few of the upper classes in my parish, but the wife of a gentleman who has a large factory in the village of Blarney, and another lady in its neighbourhood (Roman Catholics) take much interest in the National school there.

That was my own parish school, which is supported by myself and attended by a few children of the Established Church and some Presbyterians, I put some years ago in connexion with the National Board for the purpose of inspection.

No other suggestions occur to me at present as worth submitting to the Commissioners.

(Signed) Louis Perrin, Rector of Garrycloyne, Blarney.

From the Rev. George Webster, Rector of St. Nicholas, Cork.

Sir,—In reply to the printed circular you were good enough to send me, I beg leave to say that after years of close attention to the subject of education, I am persuaded that what we ought to have in every city and town in Ireland is a school supported by the Government, in which the children of labourers and tradesmen would be taught reading, writing, and arithmetic at a cost not exceeding one halfpenny a week, giving any clergyman of any denomination the power of remitting the fees altogether in the case of any particular child. I should call this school the Government School, or the Parliament School, or the Royal School—some name different from the name by which any National school is now known. The school should be open to all religious denominations, and no parent above the rank of a labourer or tradesman should be allowed to send his child to this school. If necessary, I should have two, or three, or four

such schools in a city. I should withdraw all grants from existing non-vested schools; and in saying this, you will remember I am myself the patron of six such schools under the National Board.

In addition to this Government school in every city and town, I would have a grammar school, at which the children would pay a fee not exceeding £1 a year; and I would give the Board of Education the power, under peculiar circumstances, of remitting this fee altogether in the case of some children who might be brought under their notice. In this school I should have Latin and Greek taught as well as the higher mathematics. Upon supporting these two classes of schools I would expend all the money voted by Parliament for education, and I would use all the money available in Ireland for endowed schools. Of course I should insist upon maintaining the principle of the present system of National education in Ireland as regards religious instruction, with just this difference, that I would give the local clergy more power over the teachers in these Government schools than they have at present over the teachers in the model schools.

I may add that of all the calamities that could possibly fall upon Ireland, I know no calamity that would be so fatal as the denominational system.

Your faithful servant,

(Signed) GEORGE WEBSTER.

---

(2). ROMAN CATHOLIC.

From the Rev. John Browne, R. C. Canon of Cork.

MY DEAR SIR,—In reply to the circular with which you have favoured me, I beg to offer my opinions on the subject to which it refers. The present working of the National system of education not giving satisfaction to almost any party, I therefore concur in the all but universal wish for denominational schools, but only on the condition that the teachers would be paid their entire salaries, as now, by the State, without looking at all to local aid. Local aid is not to be expected, because the demands on Catholics in this country for religious, charitable, and educational purposes are already so many that it would be *difficult*, even in the most favoured localities, to raise any supplementary fund. It would be simply *impossible* in the poorer districts. I think we are fairly supplied with schools here; the only want, perhaps, is that of infant schools, the number of which could be increased with advantage in close proximity to the other pre-existing schools. The teachers of National schools are generally competent and efficient, and I think here, at least, equal to the demand, but they are entirely underpaid. Their salaries should be *considerably* increased, in order to secure to the country in future a sufficient number of efficient teachers. The children who absent themselves from National schools here, do so not from any religious scruple, but from the poverty of their parents—chiefly from the want of clothes, and often, too, from their preference for schools conducted by religious communities, both male and female. It is of advantage to require from all children frequenting National schools, when they can afford, some small pittance, say a penny a week; for I know from experience that our people set more value on education for which they pay something than they do when it is *altogether* gratuitous. It is objectionable to have boys and girls taught in the same room, even under a mistress, but *most* objectionable under a master. Very few of the upper classes take an active part in the management of schools, that they generally leave to the clergy. Pardon me for delaying so long these meagre remarks, and believe me to be yours, with great respect and sincerity,

(Signed) JOHN BROWNE, Canon.

From the Rev. John Cronin, P.P.

Lisgoold, October, 1868.

SIR,—The following are the answers to the several queries:—

1. The present working of the National system is not satisfactory, and there is not enough of public money expended on it.
2. Adequate.
4. Some prefer sending their children to schools where the mixed system of education does not exist, others are too poor. Schools are too distant from young children, particularly in the winter season.
5. No. Because the schools are not entitled to the services of an assistant teacher, the average attendance being too low. I think a school should be entitled to the services of an assistant teacher where the average attendance amounts to forty pupils.
6. The employment of mistresses in boys' schools is not at all regarded with favour; but in mixed schools, if there be a male principal, the assistant should be female. If there be no assistant, the principal should be male.
7. Many of the children attending the schools are taught gratuitously in consequence of the poverty of parents. I think gratuitous education would not be beneficial, as the children paying school-fees attend school much more regularly than those not paying. I would recommend gratuitous education, provided the locality be taxed instead, and that parents and guardians be compelled to send their children to some school.
8. They take no interest whatever, with very few exceptions. They take no part in the general management of the schools. It would be advisable that they should take an interest in the schools. I must also observe that the people of this locality will never be contented with any other system than denominational, and, let me add, education will never be what it ought while the teachers are so miserably remunerated for their services.

(Signed) J. CRONIN, P.P.

From the Rev. Daniel Collins. P.P., *Chapel House, Rath.*

September 25, 1868.

SIR,—I beg to reply to the circular you sent me containing a list of queries to be answered about the system and operation of the National education. There are eight schools under the Board in this parish, of which I am the manager. Four of them are "MIXED." As to the material houses all are to be kept in repair by ourselves, *i.e.* by parochial subscriptions, except one, the Sherkin Female School, and I need not say that it is burdensome on a parish already poor.

As to the supply of teachers—the supply of male teachers is not equal to the demand; we can always get excellent female teachers, as they are drilled in the convents and well instructed, but the male teachers are not to be had so easily and so well qualified; I have two of them, they are not trained as I would wish, this is owing to the fact that we do not fee any training establishment like the convents, from which we could be supplied with well instructed and well drilled young men. The Christian Brothers would train them well. A teacher of youth should be animated ever with a spirit of religion.

The employment of mistresses in mixed schools in this parish is favourably regarded, girls should have a female teacher to themselves.

The number of schools in the parish is sufficient, but there are no members of the richer classes who patronize them. Sir Henry W. Becher and members of his family, who have a large portion of this parish, give subscriptions for the building or repairs of schools sometimes.

If the people here, including myself, had a voice we would improve some of the books read in the schools. I must in conclusion express my regret at not having been at home when you did me the honor of a visit.

D. COLLINS, P.P.

From Rev. John Eager, P.P. *and Vicar-General, Cloyne.*

Cloyne, September 17, 1868.

1. The peculiar circumstances of this country are more favourable to the working of the system. Our population is exclusively Catholic. The system is radically bad and dangerous, not being based on religion, and must in the end, considering the present state of the world, destroy religion. We use it as a pisaller and in the absence of better, must use it. The teachers are very badly paid.
2. The means of education are sufficient in this parish. The bishop not approving of the system and the working of it in other parts of the country will not allow us to avail ourselves fully of the aids the Board of Education gives, such as grants for buildings, &c. training of teachers, &c. This is a great loss and a serious inconvenience. Very little can be expected from local sources.
4. Though the means of education are in every way adequate and convenient many do not go to school. When able to work, they are put to work, labour being both scarce and dear. Another cause is the neglect of parents, who being brought up without education do not appreciate it. The masters are competent. There can be no room for religious scruples. Religion is never mentioned in the schools.
5. The supply of efficient masters, is not sufficient. No man who can avoid it will become a teacher, because the salary of teachers is most miserable. The remedy is to pay teachers better.
6. Schools in which boys and girls are taught together are not regarded favourably and are most objectionable.
7. Gratuitous education is not only prevalent, but is necessary and most beneficial.
8. The upper classes take no interest in the schools. Their countenance, if properly regulated, would be very useful.

(Signed), JOHN EAGER, V.-G.

From the Rev. J. Fitzpatrick, Parish Priest, Midleton, County Cork.

1.—The system of National education is deemed very unsatisfactory by the public of the parish of Midleton, county Cork. No system of education can be satisfactory which is founded on error, and which makes rules for a state of things which does not exist. But such is the system of National education in this parish and I believe generally in the south of Ireland. It supposes a mixture of pupils of different religious denominations in the National schools, and makes rules for the government of its schools as if this state of things did exist, when in reality there is no mixture at all. In the Midleton National school, conducted by the nuns of the order of the Presentation, there are in attendance about 500 pupils and sometimes 600 pupils, yet not one of this number is a Protestant or Dissenter. In the National school at Ballintowtas at which when about thirty boys and twenty-five girls attend there is not one Protestant or Dissenter, nor has there been one for the eighteen years that I am connected with the parish. The Protestant population here is very small. The Protestant clergymen have schools in connexion with the Church Education Society. They prevent as far as they can Protestant children from attending the National schools, and hence it is not likely that a mixed system of education shall ever be established in the south of Ireland.

2.—The National system of education as at present carried out by the Board of Education is not and never can be satisfactory to the Catholics of this locality, or of any part of Ireland. No system of education can be satisfactory to the Catholics of Ireland which is not based on religion, which is not interwoven with it, and which will not allow the truths of the Catholic religion, and its practice, its forms, its ceremonies, and everything connected with it, to be inculcated and impressed on the tender minds of the pupils during all the school hours, and whilst they are engaged in acquiring secular education. Hence the National system as it now exists and which makes religious education a secondary or minor concern, and which excludes from the school during certain hours all religious teaching, and every book, or sign, or emblem that would remind the Catholic of any of the distinctive truths of his religion cannot be deemed satisfactory by the Catholics of Ireland. The following fact will show how dissatisfied the public of this parish are with the present National system of education. For the last eighteen years during which I have had charge of this parish, and for many years previously, a male National school was kept in this town. The masters of this school were at all times well qualified, sufficient in number for the pupils in attendance, and attentive to the school duties; the Catholic clergymen of the parish were vigilant in their superintendence of the school, they visited it often, and used their influence to render the masters attentive, and the attendance of the pupils numerous and punctual. At this school the parents paid very little for the education of their children, and the greater part of the children attending the school were educated gratuitously. But the pupils of the town and parish were not satisfied with the school or the system. They requested me to bring to the town a branch of the Christian Brothers' Institution, and to enable me to do this they voluntarily taxed themselves to the amount of £2,500 to build a house for the brothers, and school-houses for the accommodation of the pupils. In addition, they pay every year £150 for the support of five brothers. On the introduction of the Christian brothers into the parish, the school in connexion with the Board of National Education was closed. While the school in connexion with the Board of National Education was in operation I could not, with the greatest efforts secure a larger attendance at any time than about 220 boys, while now about 450 pupils attend daily and with great punctuality, without any great efforts on my part. A large number of boys would attend the Christian brothers' schools if they were received, but as the parish could not conveniently make up funds necessary for the support of a greater number of the brothers, we are obliged to limit the number of pupils and to refuse admission to about 100 boys who would wish to attend the schools. The high value set on the education given by the Christian brothers of this town may be estimated from the following fact,—a great many boys walk a distance of ten miles per day (that is five miles coming to school and five miles returning home) in order to attend the Christian brothers' schools, although they have good National schools in their immediate neighbourhood.

3.—The means of education for the wants of this parish would be adequate if we had a sufficient number of Christian brothers. This, however, I fear we cannot have until the Government comes to our aid, establish a denominational system, and give funds for the support of the brothers. I readily admit that the present National system of education in Ireland is capable of giving a good secular education, and that in this respect it is capable of conferring and has conferred many benefits on Ireland, but the Catholics of Ireland are not content with a purely secular education: they do believe that the present system which excludes from the schools during certain hours Catholic teaching and all the distinguishing marks of Catholicity, and which inculcates a common Christianity, tends to indifferentism in religion and to infidelity, and hence they will not be satisfied with any system except that in which religious and secular education are blended together during all the school hours. The present system of National education in Ireland is considered by Catholics one of their great grievances, and I am convinced that until this grievance shall have been removed they will not feel happy or contented. The Government ought to allow each religious denomination to educate their children according to the system that best pleases them, reserving to itself the power of inspection, satisfying itself that the system which each denomination adopts is capable of giving a good, useful, and solid education, and seeing that the funds given them are properly appropriated. This is all any Government ought to require, and with this they ought to be content. On the subject of expenditure, I am of opinion that in most of the National schools the teachers are not adequately paid, but with regard to the agricultural schools the general opinion seems to be that there is a great waste of money and very little good done. With regard to the model schools, the public do complain that whilst extravagant sums of the public money are expended in the erection and repairs of those buildings, and in paying a large staff of teachers and professors, the great majority of the pupils attending those schools are the children of respectable and wealthy persons who can well afford to pay for their own education. Very few poor children attend those schools.

6. I am of opinion that boys and girls over six years of age ought not to be allowed in the same school-room, that female teachers ought not to be employed in any school where there are boys over six years of age, and that, as far as it is practicable, there should be separate school-rooms for boys and girls; and I am strongly of opinion that masters or male teachers ought never be intrusted with the education of girls of any age in National schools.

7. As far as it is practicable, the pupils ought to be required to pay something for their education when they can afford it. When required to pay they seem to set a greater value on their education.

8. All classes of the community—high and low—feel a deep interest in education. They now see that education is absolutely necessary to their advancement in wordly wealth and prosperity. They do not, however, take any active part in the general management of schools, nor are they likely to do so. The clergymen of the different religious denominations usually take an active part in the management of schools.

(Signed) J. Fitzpatrick, P.P.

From Rev. D. Foley, P.P.

Douglas, 28th September, 1868.

Sir,—In the following answers to the questions contained in your circular, I understand by the words "My neighbourhood" the parishes of Douglas and Ballygarrin, with which I am connected.

1. The present working of the National system is, on the whole, satisfactory. I say on the whole, because although up to this time no serious inconvenience has arisen from the smallness of the salaries, yet I am convinced that, in case of any vacancy now, it would, on account of the greatly altered circumstances, be very difficult to fill such vacancy by teachers so competent as those at present employed in this neighbourhood. In fact it was with considerable difficulty that we were able some short time since to get an assistant teacher for the school in Douglas, because the salary was much smaller than the wages, lodging and support included, of an ordinary farm servant in this district.

2. The means of education are sufficient for the wants of the neighbourhood, but barely so.

4. The means are used by the people, though the schools are, perhaps, too distant. In some very few instances the children are kept away from school by the poverty of the parents.

5. The supplies were obtained years ago in this neighbourhood under circumstances very different from the present; but if any vacancies occurred now, the smallness of the salaries, to which I have already alluded, would, I fear, prevent the supply of teachers, as competent as those now employed, being equal to the demand.

6. Mistresses are not so employed in this neighbourhood, and their employment in such schools would not be regarded with favour.

7. There is no gratuitous education in my neighbourhood. Some few avail themselves of that afforded by the schools of the Christian Brothers, though they are at a considerable distance.

8. No. Whether their active interference would or would not be advisable would depend on various circumstances that could not be well entered into here. With respect to denominational education, I am convinced that I do but give expression to the general—I may say to the universal—belief of all with whom I am brought into contact, when I say that no system of education but the denominational will ever succeed in Ireland, and that any success that has attended the teaching of the National schools in this part of Ireland is attributable to the fact that from the unmixed character of the attendance, these schools are practically denominational, or at least free from some of the defects of the opposite system.

I beg, sir, that you will excuse the tardiness of this answer to your circular. The delay did not arise from unwillingness to give all the information in my power, or from indifference to the interests of education, but was owing to forgetfulness, caused by a multiplicity of other business that happened to absorb all my attention when the circular was received; and if the information in this answer should seem meagre, that, I hope, will be ascribed to the desire I felt to confine myself as closely as possible to the questions contained in your circular.

(Signed) D. Foley, P.P.

From the Rev. J. J. Murphy, Canon St. Peter and St. Paul, Cork.

Cork, September 26, 1868.

My dear Sir,—I feel deeply ashamed for not having sent an answer before now to the printed queries you sent me, as well as at the scant courtesy I extended to you on your visit. Neither of these on my part were from want of due respect, but simply from pressure of duties which were obligatory.

Briefly to No. 1. As far as I know satisfactory on both points.

2. Not adequate from want of sufficient school room, the requirements for religious purposes generally being a heavy burden on the resources of the community, and as much as they can sustain, though sustained cheerfully.

3. To furnish funds from the public funds for building schools relinquishing in favour of the parish clergyman any right of property in the buildings. Much might, nevertheless, which I have already said, be contributed by the wealthier members of the community.

4. The teachers are competent. The schools in this parish are not more than five minutes' walk from its extremities. There are not any religious scruples except in the model schools, which we (the clergy) bann, or poverty of parents is certainly a preventive. They are in many cases needing the labour of the children from the moment they are able to earn anything.

5. Yes.

6. Yes, when under nuns.

7. No.

8. Some interest is taken, more as a benevolent feeling—I may say simply a benevolent feeling only. Their interference would not be desirable.

In conclusion, I would say that "the one thing necessary" is wanting—a crucifix. I am seventy-two years old. I am a priest. I am sure my love of God began with my *a b ab*, for I was at that same period instructed in that book—"The Crucifix"—and I then learned, and am to this day learning, from that Book of Books, "Christ and Him crucified." Every Catholic child ought to be allowed (and not forbidden) to look upon that Book which teaches all things necessary to salvation from the fall of Adam to the day of judgment.

I may add to the foregoing that mixed education (so called) has never obtained, nor will it ever. "The state of opinion" amongst the public is that proclaimed by the clergy as theirs—no difference. What the priests think we think, and it seems to me much the same with Protestants; nor do I believe that bringing young persons of different religions together will produce the fruit expected by the promoters thereof, but the contrary. I speak of the ostensible fruit or expectation, for the real thing is undoubtedly proselytism, or at least indifference.

(Signed) J. J. Murphy, Canon.

From the Rev. J. Murray, Parish Priest, Roscarbury, County Cork.

Roscarbury and Kilkirranmore.

1. I do not think myself competent to answer generally, I only reply as regards the query in its bearing on those schools in the united parishes above named. The National system gets on tolerably well, and as to the expenditure of the public money, there is none received except salaries of teachers.

2. The means of education are adequate, but the teaching power is mostly insufficient in all the schools.

3. A better class of teachers is most needed.

4. The people have no alternative but to avail of the means at hand. The schools are central in the localities and convenient to the people. We are not troubled with religious scruples, other sects have ample accommodation of their own of which they avail with very rare exceptions. Poverty with nakedness *in many instances* prevents poor children from going to school, and sometimes also the indifference of bad parents.

5. Inspectors and managers complain of the great difficulty of getting efficient teachers or of the difficulty of getting rid of inefficient ones—*e.g.*, a vacancy for a male teacher having lately occurred in our principal school here, I was obliged to get one from Galway. He was strongly recommended by one of the Secretaries to the Educational Board and is giving very great satisfaction, yet his salary is only £8 per quarter. The number of children in attendance daily is nearly 200. The assistants as yet allowed him are totally inefficient for the daily work.

6. No mixed schools here. We don't like that, it is very objectionable.

7. Most parents prefer to contribute a little in aid of the Board's salary to the teacher. But there are many exceptions on the plea of poverty or parsimony which is the chief motive.

8. Most or all of those called the gentry here, with perhaps one or two exceptions, feel not the slightest interest in the National system of education. Some have a malignant taste for proselytism and nothing better, and unhappily when an unwary parent has allowed his child to be but even half proselytized, the result is frightful in the demoralization of innocence, and above all, in the total disrespect for parental authority ingrafted on the youthful mind. We had recently some examples here.

(Signed) J. Murray, P.P.

From the Rev. James Rice, Queenstown.

Sir,—In reply to your circular of the 12th, I beg to state:—

1. The money spent here is well spent.

2. and 3. We want a school at the west end of this island and a suitable school at the east end, but can expect little local assistance, our own people being engaged in building a Church, and the majority of the land-owners being Protestants and without public spirit or liberality.

4. and 5. Masters are too few, the salaries being much too low for such a place as this. I cannot get teachers.

7. Gratuitous education is rather prevalent, but whenever the parents can afford anything I require of them to pay, and I believe to the advantage of the pupils.

8. It would be manifestly desirable that the upper classes should take a real interest in the schools, but as manifestly not in the management.

The religious or irreligious part of the system is radically defective, and our best National schools are not as satisfactory as the humblest of the Christian Brothers' schools. The National and patriotic part is also unsatisfactory, though some efforts have been made to make the books a little Irish in tone and spirit. Public education should be denominational, and efforts should be made to get the Christian Brothers and other religious communities to enter freely and cheerfully into the working of a true National and liberal system.

(Signed) James Rice.

From the Rev. D. Sheehan, Coachford, County Cork.

Sir,—Absence from home prevented an earlier reply to your printed circular containing eight points—

1. The system in itself is regarded as unsatisfactory and as labouring under two fundamental defects, these are the want of adequate provision for religious instruction, and the almost total ignoring of the National feelings and sentiments of the people. There has been an impartial disregard of the religious opinions of all creeds. It is not considered wise or prudent to make the history of the country a kind of forbidden fruit of the tree of knowledge; being so only serves to foster in youth a greater passion for inquiry, which is pandered to by those whose apparent calling is to nourish and foment disaffection and distrust towards the constitutional powers. When such a large amount of public money is expended for educational purposes it seems only reasonable that the education afforded should be in accordance with those feelings and traditions of the public which are pre-eminently Catholic and just. The expenditure of money in the model schools is regarded not only as extravagant but as useless.

2. The means of education for the wants of the neighbourhood are, owing to the exertions of the Catholic clergy aided by the people, quite adequate. It must be observed that the Catholic clergy have from time to time subscribed towards the furniture and stock of the schools from their own private means. Though the means of instruction are fair, still it is principally owing to the exertions of the clergy that the attendance of the schools is such as it is. If the parishioners were left to their own counsel they would in many instances either neglect sending their children to school at all, or they would send them to private schools. In fact the present National system does not commend itself to local sympathy, and hence it is the more prosperous contrive to send their children to town schools under the management of the Christian Brothers and others.

3. Very little can be expected from local sources.

4. Answer under No. 2.

5. The supply of efficient masters is limited owing to the well grounded opposition of the prelacy, to the present course of training and the mediocrity of the salary. It will come to pass, it is apprehended that, good teachers will have to transfer their services to the United States or the Colonies unless some suitable provision be made for them. Educated men are beginning to be dissatisfied with a mere competency. The feeling is considered a just one.

6. Not aware of any instance in the neighbourhood, the practice appears objectionable.

7. Not prevalent, it would appear to be most beneficial.

8. The upper classes manifest no interest in the subject of education. They neither visit nor encourage the schools. It would be most advisable and beneficial if they were liberal and well educated.

D. Sheehan, P.P.

From the Rev. Thomas Walsh.

Castlemartyr, September 13th, 1868.

Sir,—I have returned here last evening, and hasten to acknowledge your letter.

The system of National education is, I believe, not satisfactory for these reasons:—1st. When the members of two or more religions are numerous, either only those of one will avail of it, and the others refuse it, or one will be in danger, as in the case of mixed schools, of being proselytized by the adherents of managers' religion, as in the north of Ireland. 2nd. All knowledge of our country's history is carefully excluded from the National school-books, while they contain many things of no practical utility to the pupils in afterlife. 3rd. Clergymen of a different religious denomination from that of manager have no right to impart religious instruction in non-vested schools. 4th. Whilst the Presbyterians may obtain salary and books for schools with only, I believe, fifteen pupils, a similar privilege is denied Catholics.

Have they the right to refuse admittance to children of any other denomination of religion? If so, they are granted the denominational system, while all others are refused it. Finally, the change in the fundamental rule regarding the exclusion of those of a different religious denomination is highly objectionable, and has worked most prejudicially to the spiritual instruction of Roman Catholics in the north of Ireland. Large sums have been expended on "Model schools," which are of no earthly service to the great majority of the people.

Books should be completely altered.

My parish comprises Mogeely, Dungourg, and Clonmult, with portions of Lightermurrah and Ballyoughan; the Catholic population about 3,000. In Mogeely are two schools, one male, and one female; Dungourg, one male, and one female; and Clonmult is similarly circumstanced. These schools were all built by myself, without any assistance from Board of Education. The average number of children on rolls in these schools is about 540.

Any more information I can give I shall be most happy to communicate when I shall have the pleasure of seeing you.

Pray, excuse this hurried epistle.

(Signed) Thomas Walsh, p.p.

(3.) Presbyterian.

From the Rev. William Magill, Presbyterian Minister, Trinity Church, Cork.

Sir,—I have the honour to submit the enclosed remarks in answer to your queries. Will you excuse their length? Wishing you prosperity and every blessing in your great work,

I am yours very truly,
(Signed) William Magill.

Cork, July 25th, 1868.

Statements and Answers to Questions by W. S. Coward, Esq., Assistant Commissioner, Royal Commission on Primary Education.

1. I think that the working of the National system is satisfactory. I think that its funds are judiciously expended.

2. I believe that the National system has not yet had fair play in Cork. Since the opening of the Model and Carmichael schools much good has been done. Speaking generally, there is much need for a higher order of schools, and better teachers.

3. The deficiency could only be supplied by putting all the schools under the Board, building new and more commodious school-houses in each parish, and obtaining teachers of the first class suitably remunerated. I believe that if clergymen encouraged and led the way, large aid would be given in building school-houses, and important aid would be tendered in fees for teaching.

4. The means are not sufficient. Poverty does not account for it. The intelligent portion of the people are not opposed. The religious teachers favour denominational systems that are poor and sectarian and that never can compete with the National system as to teachers, emoluments, books, inspection, or an English and commercial education. I am satisfied that the responsibility of the present state of things lies on the clergy of the Churches who have aimed at their party interests rather than at the advancement of National education.

5. There is not much difficulty in finding teachers. It is simply a question of salary. The education market is ruled by the same laws as any other market. A good salary gets a good teacher. Good salaries and good college training in knowledge and the *art of teaching* will secure a sufficiently large race of teachers.

6. I believe the feeling here is in favour of boys' schools taught by men, and of girls' schools taught by women. I do not think that schools in which the sexes are mixed are liked.

7. Gratuitous education is prevalent. I am opposed to it. It is better than nothing, but on economic and even moral grounds I think that all should pay. What is not paid for is not valued.

8. I am not aware that the upper classes take any interest in education or in the management of schools. If they did the country would be in a different state from what it is. The matter is left nearly wholly to clergymen. If the upper classes of all denominations could be induced to take a lively interest in the education and elevation of the working classes, by the creation and partial endowment of a sufficient number of suitable schools, and by such superintendence as would secure that the work of the teachers should be well done, and that the well-being of the children should be promoted, it would bridge the widening gulf between class and class in Ireland more than anything else that could be named.

9. With regard to mixed education, I am very decidedly of opinion that it would work disastrously for the interests of this country.

1st. In Munster, where Presbyterians are few and far scattered and in the great majority of instances well off, a denominational school would be nearly impracticable or impossible.

2nd. In hundreds of parishes in Munster there is not an average of half a dozen children of Protestants of the rank usually attending National schools, and in them, on the denominational system, there could be no school.

3rd. The same observation applies to Roman Catholics in many places in Ulster.

4th. In all these parishes and places the alternative would be a proselytizing school for the perversion of children or no education at all.

5th. A denominational system will make every school a proselytising apparatus, would give State support to a school as a religious establishment; and give all the parties concerned whether teacher, parent, or patron *an interest* in proselytizing for school purposes and to increase the State bounty.

6th. The denominational system would set up an ecclesiastical establishment in every parish in Ireland, rival and opposite ecclesiastical establishments in each parish, and, guarded as it may be by the legislature, it would turn the country into an arena of hired religious propagandism.

7th. Religious zeal being what it is in Ireland no better scheme could be devised for its culture in the worst form of it, that form in which it is seen that the most money gets the most pupils for a school.

8th. Separate by law, and State aid, the Irish population into three great classes, Presbyterian, Episcopal, Roman Catholic, for all educational purposes, bring up the rising generation in separation, jealousy, and suspicion, and where then, and how can there be union for any national purpose whatever.

9th. Rather than such a system I would greatly prefer a purely secular system of education, leaving the obligation to train religiously where God has left it, on the parents alone.

10th. I believe that the immense majority of Irishmen if they were let alone would be contented with a mixed system which offers equal advantages to all. Everybody knows that the agitation for a denominational system originated in and is continued by the clergy of the Episcopal and Roman Catholic Churches.

11th. The advantages and blessings of the mixed system are incalculable, and it only needs fair play and time to tell on the destinies of Ireland with an irrisistible force of elevation and improvement.

12th. One of the great evils of Ireland is tampering with the educational system, and the consequent agitation of ecclesiastics and politicians. The country needs peace on this question.

There are three particulars in the working of the National system which I think might be improved.

1. I think civil history ought to be taught in all the schools. There is no education without it. Everybody feels the want of it.

2. A longer and more thorough training for teachers in scientific knowledge, in the art of teaching, and in the government of a school.

3. An increase of salary for first class teachers in cities and large towns as compared with the same class in rival parishes. After all, one of the greatest wants of the National system in Ireland is a race of patrons who shall see good work properly done by teachers, a place for everything, and everything in its place. Without that the best laws and provisions of "the powers that be" will fail. For Ireland, for education, for civilization, can such a race of true, good, enlightened, manly men be found?

(Signed) W. Magill.

From the Rev. George Magill.

Cork.

Dear Sir,—I shall endeavour to be as brief and as explicit as possible in answering your queries, and in order the better to do so, shall take them up in their order.

1. I consider the present working of the National system of education unsatisfactory in itself, and I scarcely know an individual who is satisfied with it. I have a great admiration for the system. I dislike the excrescences which have been permitted to grow upon it. I do not consider the sum annually voted for primary education disproportionate to the wants of the country. On the contrary, I am of opinion it should be increased.

2. I think the school accommodation for the children of the city of Cork is almost, if not altogether adequate (so far as I have been able to ascertain), though I disapprove entirely of the character of the schools. I am of opinion that no clerk in holy orders or member of a monastic institution should be eligible to conduct a school in connexion with the National Board.

3. In answer to query No. 3, I should say multiply minor model schools, strike off all convent schools. Parents cannot be expected to contribute more in the shape of school-fees than they are giving at present.

4. The Cork model school has not been attended by the members of the Church of Rome. This, I believe, is owing to the interdict of the Bishops rather than to the scruples of the parents or children.

5. The supply of efficient teachers is very far indeed from being equal to the demand, and it will continue so, not merely till the State gives an ample wage to *secure* the services of efficient men, but also till a suitable retiring pension convinces the teachers that it will be to their interest to remain in the employment of the Commissioners. Why Inspectors should have pensions, whilst the rank and file are in old age sent to the poorhouse, has always been to me a mystery.

6. I never heard of the head teacher of a boys' school being a female. When I lived in Antrim I had the management of seven schools, and two of these were mixed, and were most efficiently conducted by females. I believe female assistants in mixed schools to be popular and deservedly so. I have at present a popular and well-attended mixed school taught by a female.

7. Gratuitous education I think is not prevalent, but I am not sufficiently well acquainted with the district to speak positively, except in the case of orphans or those on the very verge of pauperism, I am sure gratuitous education would not be desirable. Whatever tends to destroy the self-reliance and self-respect of any people is in itself evil, and should be scrupulously avoided.

8. The upper classes do not take that active interest in schools which is so much to be desired, and which would be productive of incalculable good. Their interest, where it may be said to exist at all, is almost limited to the cold yearly donation, or perhaps the formal visit which is gone through as a sort of meritorious penance. To this there are of course many noble and praiseworthy exceptions.

Remarks.

That system of education is best (other things being equal) which draws all classes and creeds together, and which, by a friendly fellowship in youth, prepares the way for burying in afterlife those hatreds which are a curse to any land, and a reproach to any people. The peace of society and the stability of the empire alike demand that the rising generation should be educated together, and not be kept apart, as though the sons of the soil did not all belong to the same order of intelligent beings, or as though the great battle of life was to be fought by them in different planets. Looking at education from this standpoint, it is evident that a denominational system is alike prejudicial to the interests of peace and the consolidation of empire. Let the seeds of distrust be sown in the bosom of youth, and the bitter fruits thereof will in due time be reaped in every department of social and political life. Besides, I look upon a denominational system of education as a virtual endowment of all creeds by the State, and this I regard as an unmitigated evil—not because all are made equal, but because all creeds thereby are treated as alike true. This would in the end corrupt the national mind, and prepare the way for a universal scepticism. If there be so much dissatisfaction with the National Board that we must have a change, then let us have a purely secular system, and let the clergy and their assistants attend to the religious element after school-hours. It is quite evident that a denominational system will be sure to lower the standard of education, inasmuch as struggling rival schools cannot secure the efficient masters that could be got for flourishing remunerative ones. The worst feature, however, to my mind is this, that minorities will be driven into the meshes of proselytism, or be shut out from education altogether. Clergyman though I am, I object to the children of this land being placed in the matter of education at the mercy of priest or presbyter; and I would not think it right for a paternal Government to step in and help the Protestant and Romish hierarchy of the country to mount the back of a long-suffering laity.

I hope, therefore, that the present system will be maintained in its integrity; that the present irresponsible Commissioners will be removed, and paid men, with merely administrative function, put in their stead. If we had had the system administered firmly and impartially from the first, gentlemen like the Poor Law Commissioners England's best gifts to Ireland would have at present as it had at first, the benison of His Holiness and the Irish Romish Bishop, as well as the hearty support of the entire Presbyterian Church.

Laymen.

From Colonel R. W. Aldworth.

Rathmore, Kinsale.

Sir,—1. From all sources of information open to me, I find that the present working of the National system (especially in the country districts) is productive of the lowest results as regards education, and quite below what one might reasonably expect from the large expenditure of money by the State.

2. The R. C. educational means seem sufficiently provided for, but those who do not approve the National system as at present administered are at serious disadvantage.

3. Means of education insufficient, owing to conscientious scruples of various denominations. N.B.—Local aid generally increases in proportion to the value of education given.

4 and 5. Masters not generally trained men in the National schools: I know nothing of the causes of this. Under the Diocesan Church Education Society the schools are generally taught by efficient and trained teachers.

6. The employment of mistresses might be very usefully sought for small (as to age) boys' schools and mixed schools. Mixed schools are not resorted to except when the funds are not equal to meet the expenses of separate schools.

7. Gratuitous education is a mistake, and felt more and more to be so. However small the charge, it would be well payment were the rule.

8. Where you find those in better position interested, the school is generally benefited by their care and superintendence.

(Signed) R. W. Aldworth, Colonel.

From the Earl of Bandon.

Castle Bernard, Bandon.

My dear Sir,—I have many apologies to make for having omitted to send you my opinion on the subject of education in this country, having both in Parliament and at home taken rather an active part. I was one of those who objected to the introduction of any system of education from which the Sacred Scriptures were excluded from all children. When the National system was changed and non-vested schools introduced, I claimed the same advantage for the parochial schools as the Roman Catholic and convent schools; and I believe if the conscientious scruples of the Protestant clergy and laity had been attended to, that the intended system might have been successfully carried on in the vested schools, as far as Protestants are concerned, by the schools being placed as in the workhouses, under a lay neutral management. Now, we have in each parish a Roman Catholic National school liberally supported by the State, and a Protestant school supported by voluntary contributions, which causes great jealousy. The National schools are badly managed. The Census shows a large proportion of the children can neither read or write. No agricultural education is given in the primary schools to a population dependent too much on farming, or any other industrial pursuits, and the moral training has been shown by the result of the last few years to be anything but satisfactory. With regard to the future, I believe in the primary schools nothing but denominational education is practicable, but while the clergy of the respective denominations uphold the religious education there should be some local supervision in addition to inspection of the general character and attainment of the pupils in the schools.

Believe me, yours faithfully,

(Signed) Bandon.

From John George Mac Carthy, Esq.

Cork.

1. I suggest a frank adoption of the denominational system.

For primary education, at least, this system prevails in England, France, Russia, and most civilized countries. I think it is dangerous to make Ireland an exception to the approved rule of civilized life.

Its introduction into Ireland would be comparatively easy, seeing that most of our primary schools are in fact either exclusively Catholic or exclusively Protestant.

I think such introduction desirable, because it would make our system conform to the facts with which it has to deal. It seems to me anomalous to expose the precautions necessary for "mixed" schools, or schools that are not "mixed."

I desire it also because it would take away the appearance of evasion which hangs about our present methods. Our schools are (to a great extent) virtually denominational. But if virtually why not openly? Why should the State in one of its noblest functions appear to act furtively?

However, the introduction of the denominational system would render needless a hundred awkward prohibitions which now mar educational working and annoy the workers. It would be no longer necessary to exclude from the National school-room the symbols and practices of the national faith. The cross of Christ need not be barred, nor the child taught that prayer is penal. Of course the greatest

advantage remains—the frank unreserved use of the most potent of all educated influence in the work of education. The worst thing which can happen a child is to give him intellectual development, and refuse him moral and religious development. The next worst thing is what happens with us, namely, the subordination of moral and religious development to intellectual development. Indeed, the latter system is logically more indefensible than the former. It may conceivably be right for the State to say, "Religion is bad; exclude it." But it cannot be right for the State to say, "Respect religion; but keep as clear of it as you can." If religion have any proper place at all in a school it is the first place. Its function is essential, not incidental. As Guizot says, "the very atmosphere of a school should be religious."

2. My second suggestion is, that in our National schools our national history should be taught, our national heroes honoured, and our national poetry said and sung. I look upon it as quite impossible to convert Ireland into an English shire. The thing has been tried for 700 years, and it has failed. For good or evil, Ireland is a nation, and had better be trusted as such. I consider it a grave error to identify nationality with revolution, and to relegate every patriotic association to the Fenians. Nor would I fear that this dissension would be fostered. If Irish history has any lesson it is the folly of dissension, the desirableness of Catholic and Protestant, Celt and Saxon, working together for the good of their common country.

3. Lastly, I suggest that, industrial training should receive more attention from the Board. Our people so quick to learn are nevertheless deficient in technical knowledge of all kinds. It ought not to be difficult to teach the girls sewing, cooking, and some home manufacture: the boys drawing, mechanics, and agriculture.

4. In conclusion, I would say that, to a nation as to a man, the gift of merely literary instruction may be an evil. Separate it from nationality, and you foster disaffection, separate it from practical knowledge, and you create that discontent with the ordinary avocations of life which is the forerunner of so many social disorders; but combine it with these three as it may most readily be combined, and you will have something like a truly NATIONAL EDUCATION.

JOHN GEORGE M'CARTHY.

NATIONAL TEACHERS.

From Mr. Thomas Bateman, St. Michael's National School, Ballintemple, Cork.

24 July, 1868.

SIR,—As you have kindly promised to lay the grievances of schoolmasters before Her Majesty's Commission on Primary Education, I beg to mention the following as worthy of attention:—

1. The salaries paid by the National Board of Education are altogether inadequate, and bear no reasonable proportion to (*a*) the amount of study required to qualify schoolmasters for promotion to what are *by a figure of speech* called the higher grades of the service; (*b*) the amount of time and labour schoolmasters must bestow on the working of their schools. No paltry increase of five or ten per cent. will remedy this.

2. The method of promoting schoolmasters which the Board adopts is to my mind particularly tedious and absurd, and gives the Inspector too much power of keeping schoolmasters down, sometimes it would seem through mere caprice. A man either *is* or *is not* fit to teach a National school, and by all means let him prove his fitness by creditably passing a rigid examination before he is allowed any salary from the public funds, and then let his future promotion depend upon proved efficiency in teaching coupled with length of service.

3. The tenure by which schoolmasters hold their office is very unfair, a manager can at any time dismiss his schoolmaster without even assigning a cause and the Board will indorse his act. I have the highest confidence in my own manager, but that is nothing to the purpose. If the schoolmaster is a public servant why should he be treated so differently from the way in which other public officers are treated? The truth seems to be that the schoolmaster is sacrificed to the phantom of united education.

4. It is a grievance that schoolmasters cannot look forward to a time when they may retire from their arduous duties in the receipt of adequate pensions.

5. It is a grievance that any gentleman should be called a manager of a National school and should have entire control over the schoolmaster, when he (the manager) does not provide a residence for the schoolmaster, a penny towards his salary, or even a room in which the school is to be constructed. What the Board can gain for education by giving such a gentleman absolute control over a schoolmaster I am at a loss to understand.

6. It is a grievance and an *insult* to schoolmasters that the Board should print among its "Rules and Regulations" this degrading sentence:—"The Commissioners do not correspond with the teachers of National schools." It is curious to compare this with the way in which the Board speaks of schoolmasters in another place:—"National teachers should be persons of Christian sentiment, of calm temper and discretion; they should be imbued with a spirit of peace, of obedience to the law, and of loyalty to their sovereign; they should not only possess the art of communicating knowledge, but be capable of moulding the mind of youth, and of giving to the power which education confers a useful direction." Personally, it makes no difference to me whether the Commissioners of Education would answer a letter of mine or not; but I conceive their business (education) would often be more efficiently carried on if they would answer a plain question asked by one of their schoolmasters. In all I have said, I have taken for granted that the schoolmaster is a useful public servant, and if he is not this, the sooner he is made so the better for public education.

(Signed) THOMAS BATEMAN.

From Mr. William Conway, Teacher, Passage West Male National School, County Cork, Ireland.

SIR,—I beg to send you the items of information made out to the best of my ability, which you desired me to send you.

The actual number of boys who have left the school A.D., 1867, having completed the average duration of time at school (viz., 2·1 years) is 8.

The number who left in the same year who completed the course contemplated, being the four Reading books, is 6.

During the year ending 30th of June, 1868, the entire number of days, not including Saturdays, devoted to secular instruction was 230.

During the same year, the average number of attendances for each child was 88·7.

Specimens of best attendances during that year of 230 school-days, are—one boy attended 201 days; another, 198 days; and a third attended 189 days. Specimens of worst attendances during the same time are—one boy attended but 6 days; another, 13 days; and a third boy attended 45 days. In the year 1866 this locality was not visited by sickness to any great degree, nor was the year ushered in by a severe winter, and consequently the proportion of daily average attendance to 100 average on rolls was pretty equable and high. The months in which it was highest were May (when it was 74·1), July (when it was 72·2), and August (when it was 73·4). The months of the same year when it was lowest, probably on account of the cold, were, January (when it was 60), March (when it was 63), and December (when it was 58).

In the year 1867 the weather during January and March was extremely severe, the frost and ice remaining a long time unthawed, and consequently the attendance during those months was low. Again, during the months of May and July, that contagious disease—the fever—raged in the immediate vicinity of the school, and this made the attendance low in those months. The proportion of daily average attendance to 100 average on rolls was greatest in the following months:—September (when it was 71·2), June (when it was 68·3), and February (when it was 67·7). The weather in February was comparatively mild that year. The months of 1867, when the proportion of daily average attendance to 100 average on rolls was lowest, were—January, when it was 50; March, when it was 59; and December, when it was 50·2. In the mid-winter preceding 1868, the current year, a curious disease attacked the young and several of the people here, so as to become an epidemic. A great many of the scholars were months at home, sick of it. The lower jaw and neck became sore and swollen, and appeared to be full of large hard lumps, so that it was difficult to use any food. The weather was unusually wet also at the time. Under those influences the proportion of daily average attendance to 100 average on rolls was, in January, 47; and in February, 50·9; these being the months when it was lowest. The months during which it was highest were May, when it was 63·4; and April, when it was 60·8, but I expect it will be higher in the autumn months.

The highest rate of school-fees actually paid at present is 5*s.* per quarter, which is paid by only one boy, a few boys pay 3*d.* per week, and the lowest paid is 1*d.* per week, which is the sum generally paid. There is no distinction made in the method of treating those who do pay and those who do not; and accordingly, many come to the conclusion, that they will get the same treatment whether they pay or not; and hence there is a constantly increasing number of those who do not pay.

I fear matters would be still worse under a system of payment by results, if once the children got hold of the idea that, by attending school and by good answering, they would be earning money for the teacher, as they would soon set a bonus on their attendance and on their appearance before an Inspector for examination, and they would thus be caused to lose sight of the value of education to themselves.

Sir, might I say that in all schools where there are no special funds set apart for keeping the school requisites in working order, the teacher feels sometimes greatly at a loss. Say a large map of the world has been worn after a service of twenty years, or some such requisites are needed to be renewed or supplied, from what funds are the moneys to be got? It is enough one would think for the patron to pay the rent of the school, which in some cases is considerable; and the teacher feels delicate in putting him to more expense. The Board formerly gave a triennial grant of books or requisites, and unfortunately that has been now withdrawn. As to raising the money among the scholars when they do not pay the school-fees, one would think this a hardship, and the teachers' pay would appear already too small for further curtailment. Could any remedy be applied?

One other source of discomfort to the teacher, and one from which other public servants, equally humble as he, such as poorhouse officials and railway companies' servants are guarded, I will venture to put before you: a person, who from his boyhood continues

until the age of fifty, teaching under the Board, and who never does any other work, is at that age quite unfit for any other employment. Yet he is as liable to be turned adrift on the world, plucked up by the roots and flung out a useless weed to rot on the highway, as though he were in the heyday of youth, ready with that health and vigour which he had spent in the service of the Board and of the public, to wrest a livelihood in some new sphere of usefulness. But you will say, surely there is no danger of any thing so harsh from the Board so long as he pursues the line of conduct which kept him until then in his employment. Now please consider such casualties as these. A new inspector or patron with a protege or friend unprovided for, who would be a teacher, it would be hard in human flesh to resist the temptation of providing for him at whatever cost.

But the source of greatest danger to a teacher established in a town is from a quarter where one would least expect. In Youghal, Middleton, Fermoy, and I dare say other towns, monks' schools have been established, and I do not know what became of the National teachers of those towns. I cannot say whether there was any respect paid to "vested rights" in their case, or no. But one cannot help thinking that if such a teacher as I have before described were ruined in this way, it would be, to say the least, a sorrowful thing, and not in accordance with the usual conduct of benevolent societies. But why, you ask, are the National teachers brushed away to make room for monks' schools? Are the monks better teachers? Are those unfit for teaching carefully weeded out from amongst them as they are from amongst the National teachers? If the monks are entirely beyond the responsibility to Inspectors does not want of responsibility to a visible and coercive power tend directly to a laxity of habit and a flagging of energy? Do the monks, if they be able, fairly stand competitive examinations amongst the other teachers? Do they make writers and spellers as accurate, and readers as good, in the short time poor children stay at school as are made in the National schools? And if not, why are they preferred? Are their examinations but displays for the purpose of puffing, which puffing is still further extended by speeches delivered on the occasion, by lengthy articles in newspapers and even by Honorable Members in Parliament? Are not the examinations in the National schools searching and prying investigations, held by professional Inspectors to discover faults, and for no other purpose? But let us cease such questions, merely remarking what avail untiring efforts under the lynx-eyed and well paid watcher, and what avail homely successes against inundating floods of public praise. Then the very strong Irish religious feeling is entirely in favour of the monks. Further, their funds to procure aids to teach, such as maps, diagrams, models, &c., seem to be inexhaustible. Their buildings are on the largest scale. They get pupils to copy off plans of buildings, &c., and when parents see those high estimates are formed of the progress of children whose attainments otherwise are not tested. A National teacher, on the contrary, is sometimes prevented by the Inspector from introducing a new branch of study lest his usefulness as an elementary teacher might be impaired, and thus technical instruction is debarred in the National school, while the monks can take full swing in that way, and so get appearances on their side. Trusting you will bear with this long paper, I will conclude by repeating the question—What is to become of the man who has given thirty years in the service of the Board and of the public, if, through influences such as these, and without any fault or defect of his own, he is flung out on the wayside?

I am, sir, with the most profound respect,

Your obedient servant,

WILLIAM CONWAY, Teacher.

From Mr. John Robinson, Teacher, Carmichael Schools, Cork.

21st July, 1868.

The following I consider to be the principal grievances under which National teachers labour:—

1st. Insufficient class salary.
2nd. Absence of pensions.
3rd. Insecurity of tenure.
4th. The closing practically of the avenues of promotion to the higher offices of the Board, such as inspectorships and clerkships in the office.
5th. Plan of examinations.

The following, I think, would be a fair scale of salaries:—Monitors (to serve three years)—first year £10; second year £15; third year £20; on the completion of this term to be entitled to an assistantship with the salary of probationer £25; class III² £30; III¹ £38; II² £44; II¹ £52; I² £60; I² 70; I¹ £80: The adoption of this scale would, I believe, do away with grievance No. 1.

With regard to No. 2, it is almost unnecessary to make any comments. Other servants of the State not more usefully employed, have something to look forward to when through old age or sickness they are incapacitated for duty, and why not the National teachers? The salary of National teachers at present averages about £33, and out of this it is perfectly impossible to lay up anything for future evil days. If comparisons were allowable, it might be asked whether a gauger or a teacher does more good to the State, and yet the one starts with a comfortable salary of £60 a year, and 2*s.* a day when on duty, while a poor probationer (with qualifications which at least are equal to those of a second class gauger) commences his career with the pitiful sum of £15 annually. In the future the workhouse stares the teacher in the face, while the excise officer looks contentedly forward to a retiring pension.

With regard to grievance No. 3, it is notorious that managers are vested with full power in the dismissal of teachers. This power, I believe, is not often abused; but cases do occur of great harshness (I have known a first of first teacher driven out of the service through the harsh treatment of his manager), and I think it would tend greatly to the amelioration of the condition of the teacher if this power were restricted. This, I believe, might be effected by the Commissioners withholding the grant from any school where the teacher had been dismissed without the manager satisfying them that there was just cause for such dismissal.

With regard to No. 4, I think it would have a most beneficial effect if Inspectors and clerks were chosen from among the teachers alone, and that there is ability enough among them is sufficiently evidenced by their success when they are allowed to compete—that is to say, when they are fortunate enough in obtaining some great man's nomination. Why not allow every teacher satisfying the conditions required to compete free of any nomination, making it a condition, however, that he should have reached the highest grade of first? If nominations are to exist at all, let them rest alone in the hands of the Commissioners. Many men at the present time are raised to the position of Inspectors who know absolutely nothing about the practice of teaching except what is to be gleaned from books. Are not first class excise officers promoted to division officers, thence to supervisorships, and so on, and why not teachers to inspectorships, &c.? Who ought to make a more efficient Inspector of schools than the man who has raised himself to the highest rank of his profession?

The plan of the male examinations is, I conceive, defective. Two examinations—a written and oral—sometimes separated by a space of eight or nine months, must be attended before a teacher can obtain promotion. During all this time he is held in great suspense, and the slightest trifle, such as removal to another district, may prevent his being allowed to attend the oral, and then his written goes for nought.

Why not have the two examinations at the same time? When a teacher is allowed forward at all it is on the understanding that his school is in a fair condition. Why not then at once give him the promotion he seeks, if his literary and scientific acquirements entitle him to it? The female teachers are better off in this respect, as their written and oral examinations are combined into one. I think I am a fair example myself of a sufferer by this anomaly. Two days before coming to my present situation I competed at the written examinations, held in Waterford, for 1st of 1st, being then 2nd of 1st, and my written papers were transmitted by the Inspector there to the Head Inspector here, and as I had 88 per cent, I had every reason to think that I would be summoned to the coming oral examination, but the fact was the Head Inspector here would not allow me forward as I had been only eight months in his district when it was held, and he could not allow me forward he said without twelve months acquaintance. Thus I lost my promotion by changing my district although I was never out of the Board's service one hour, and not only was my promotion lost that year but also the succeeding one too.

From Mr. Jeremiah Twomey, National Teacher, Cork.

July 9, 1868.

I would respectfully suggest to the Commissioners of Primary Education—

1. That it would tend much to the regular attendance of pupils to have school fees paid at the commencement of either the week or the quarter.

2. That as the majority of National teachers are either in the second or third class, and that it is next to impossible for the majority of these ever to rise to first class, that these teachers in these low grades be paid an increase of their present salaries, sufficient to keep themselves and their families in decency, sufficient to provide for them the *necessaries* of life. Of course the first class teacher's salary should be raised proportionally. A teacher in the highest grade of the National Board should have from the State £100 a year.

3. That as salaries at present are barely sufficient to meet the present wants of the teachers and their families, I would respectfully suggest that when a teacher who has spent the best of his days in the service of the State becomes incapacitated for his onerous duties, either by old age, or by illness, he be granted an annual pension of at least two-thirds of his salary from the Education Board, or something respectable as yearly pension, to keep him in his old age from that dread doom the *poorhouse*.

4. And lastly, that in the event of an investigation into the working of the National system of education in Ireland, some of the teachers themselves be examined as to its working, as far as their experience goes.

(Signed) JEREMIAH TWOMEY, National Teacher.

1. *Extent* :—
Ample supply of schools for present school-going population, ... 13–16
Proportion of *schools* to *population* in country places, 17, 18
Schools so numerous as to injure one another, . . 19
Instance near Ballyclare, ... 20, 21
Consequently small schools under inferior teachers, 22–24
Vested schools at Doagh, Kilroot, and Bellahill, 25, 26
Profusion of schools at Woodburne, ... 27
Deficiency if anywhere in towns, *e.g.* Newtownards, 28–30
But *profusion* around it, ... 31, 32
In county Armagh, fewer National and more Church schools, ... 33
Diversity of opinion in Belfast as to adequacy of school accommodation, ... 34–37
The wants in Belfast due rather to *bad distribution* of schools. Instances, Stanhope-street, Clifton-street, and Trinity-street schools, ... 38–41
Instance in Conway-street, ... 42
Placing of schools determined by rival ministers of religion, ... 43
Sometimes indiscriminately, sometimes in avowed antagonism, ... 44
Instances, ... 45–47
Opinion of Rev. L. Hünges, ... 48, 49
2. *Character* :—
Quality of accommodation often very bad, . . 50
Instance in Carrickfergus, ... 50–52
,, Belfast, ... 53–55
Foulness of offices in National schools, . . . 56, 57
Accommodation in country schools often falls far short of requirements of health, ... 58
Instances, ... 59–62
Mud floors, ... 63
Buildings erected expressly for schools generally good, 65
Want of *playgrounds*, ... 66
Two temptations to truancy per diem, . . . 67
Accommodation in *convent schools*, ... 68
,, *Christian Brothers' schools*, . 69
,, *Church schools*, ... 70
Conclusions concerning extent and quality of accommodation, ... 71
How far remediable by National Board, . . . 72

SECTION II.—SCHOOL ATTENDANCE.

Causes which shorten school-life in Belfast, . 74, 75
Irregularity of attendance, ... 76
Disproportion between names on *roll* and *average attendance*; table, ... 77
Average attendance in Belfast, 62·1 per cent. of names on roll, ... 78
Some 8,000 children daily absent from school in Belfast, ... 79
Attendance in smaller towns, Carrickfergus, Comber, Lurgan, Newtownards, ... 80, 81
Average in small towns 61 per cent., ... 82
In country places about 60 per cent. 83
On the whole not two-thirds in daily attendance at National schools, ... 84
Attendance at *Church schools*, ... 85, 89
Average attendance at *National* and *Church schools* together, ... 90
Remedies attempted in *Church schools*, . . . 91
,, *National schools*, ... 92
Their unsatisfactory character, ... 93
Suggestions made by correspondents, ... 94
(1.) *To return part of fees as a premium*, . 95
(2.) *To make schooling gratuitous*, . . . 96
(3.) *Compulsion*, ... 97
Balance of opinion in favour of some form of *compulsion*, ... 98

Paragraph

Indirect compulsion and an *educational test*, . . 98
Objection to compulsion avoided, ... 99
Practicability of a test, ... 100
Statistics of school attendance in—
(1.) *Belfast*, ... 102
(2.) *Lurgan*, ... 103, 104
(3.) *Comber*, *Newtownards*, *Armagh*, . 105, 106
Better attendance by Protestant than by Roman Catholic children, ... 107–109

SECTION III.—MANAGEMENT OF SCHOOLS.

Rules concerning *patrons*, ... 110
Powers and *responsibilities* of patrons, . . . 111
Relative positions of *patrons* and *teachers*, . . 112
Three forms of patronship, ... 113
(1.) Patron an *individual minister of religion*, . . 114
Such schools *quasi*-denominational, ... 115
(*a.*) By *presumption*, ... 116
(*b.*) By *situation*, ... 117–120
(*c.*) By *teachers* being all of *one denomination*, 121, 122
(*d.*) By unwillingness of *other clergymen* to visit them, ... 123
(2.) Patron an *individual layman*; such schools less denominational, ... 124
E.g. South Taylorstown National School, . 125, 126
Glastrey, ,, . . 127
Blundell's Grange, ,, . 128, 129
Whitehouse, ,, . 130–132
Less privacy about such schools, ... 134
More freedom for clergy to visit them, . . . 135
This form more National, ... 136
Position of teacher under an *individual* patron, . . 137
Powers of patrons *not* often *abused*, ... 138
(3.) Patronship vested in a *committee*, . . . 139
Committee should be of *mixed denominations*, . . 140
Case of Dr. Sullivan's schools, Holywood, . . . 141
Names of informants in the case; 142
History of Old Churchview School, ... 143
Recent increase in Roman Catholic population, . 144
Dr. Sullivan's first endowment, ... 145
Constitution of original committee, ... 146
Members of committee, ... 147
Denominations of *teachers* appointed, . . . 148
Denominations of *scholars*, ... 149
Report of the committee in 1868, ... 150
At formation of committee, no resident priest in Holywood, ... 151
A priest resident *before the schools were opened*, . 152
Reason assigned by committee for not admitting *the priest*, ... 153
Offer made to two Roman Catholic *laymen*, . . 154
Special ground taken for excluding the *present priest*, 155
But *all resident priests* have been alike excluded, . 156
Difficult position of the committee, ... 157
The Committee not unanimous, ... 158
Bitter spirit in Holywood, ... 159
Incidental injury to the schools through exclusion of the *priest*, ... 160–162
Completeness of these schools, with *one great exception*, 163
Moral of the case, ... 164
Local aid rarely raised for teacher's salary, . . 165
In Belfast, ... 166
In county Antrim, ... 167
,, Down, ... 168
,, Armagh, ... 169
Contrast, ... 170
In *Church schools*, ... 171

SECTION IV.—TEACHERS.

Two classes of teachers—*secular* and *religious*, 172, 173
The National teacher :—
(1.) *His position* under his manager, ... 174
Manager's powers may be exercised in various ways, ... 175
Control of manager over *fees*, ... 176
General effect of teacher's position, . . . 177
Rule that National Board does not *correspond* with teachers, ... 178
Complaints about the Dublin office, . 179, 180
Sometimes *correspondence with teachers* might be valuable, ... 181

Paragraph

The National teacher:—
(2.) *His qualifications*, ... 183
As high as can be expected for the *emoluments*, 184
Teachers vary greatly in *competency*, . . 185
Board's *classification* a *fair index*, ... 186
Classification of teachers of seventy National schools, ... 187
Third-class Teachers should not be *principals*, 188
Teachers of *Church schools* wanting in method and precision, ... 190
Specimens of orthography, ... 191
(3.) *His emoluments*:—
(*a.*) *Board salaries*, ... 193
Highest attainable remuneration, ... 194
Usual amount wholly inadequate, ... 195
Instances:—Corcrain National school, . . 196
Maghery Kilcranny ,, . . 197
Lisadian ,, . . 198
Drumgaw ,, . . 199
Poorest schools in co. Armagh, ... 200
(*b.*) *School-fees*, ... 201
Are parents too poor to pay? 202
Unwillingness to contribute towards a *State* institution, ... 203
No sense of justice or gratitude, ... 204
Feeling of the *teachers*, ... 205
Opinion of *clergy*, &c., ... 206, 207
In favour of fees in *principle*, ... 208
Practice in National schools, ... 209
Causes which lower the rate of fees—*competition*, ... 210, 211
Usual state of a *country village*, ... 212
Helplessness of the *teacher*, ... 213
Instances:—Ennislare, ... 214
Lisnadill, ... 215
Maghery Kilcranny, ... 216
Four other schools, ... 217
Town schools, ... 219
A *private school* in Belfast, ... 220, 221
Close to a dozen National schools, . . . 222
Fountain-square National school, . . 223, 225
Contrast, ... 226
Present system of fees unsatisfactory, . . 227, 228
Teacher should be less dependent on his *attendance*, ... 229, 230
Plan for improved mode of *exacting fees*, 231, 232
(*c.*) *Local contributions*, ... 233
Average amount, ... 234
Larger in *Church schools*, ... 235
National teacher has sometimes to pay for his school, ... 236
Contributions larger in county Armagh than Antrim and Down, ... 237

SECTION V.—INSTRUCTION—(*a*) RELIGIOUS.

Deals with *practice* only, ... 239
Rules of National Board, ... 240
Permissive only, ... 241
Practice takes *three forms*, ... 242
(1.) Religious instruction separately for *each denomination*, ... 243
e.g., at Holywood, ... 244
,, Aghanlig, ... 245
This form is the original plan of Lord Derby, 246
No difficulty where there are several rooms, as at Whitehouse, ... 247
Exceptional circumstances at Holywood, . 248
The plan successful when tried, ... 249
But not generally practised, ... 250
(2.) Religious instruction for *one denomination only*, 251
Inconvenience when religious precedes secular instruction, ... 252
The *Certificate Book* usually blank, . . 253
Instances of *infringement of Rule*, . . . 254
Incomplete compliance with Rule, . . 255, 256
Objections when religious follows secular instruction, ... 258–60
(3.) *No religious instruction* at all, ... 261
As in Belfast factory schools, ... 262
And in certain other schools, . . . 263–5
Combined religious instruction nearly extinct, . 266
Relative merits of the three plans, ... 267
First and third alone satisfactory, ... 268

INSTRUCTION (*b*)—SECULAR.

Reading.—Harsh and unrefined, ... 269
Faults in the National reading books, . . 270, 271
Instances of good reading, ... 272, 273

Paragraph

Need of an intermediate book between Second and Third, ... 274
Complaint of nuns at Hamilton-street convent, . 275
Writing.—Bad in National schools, better elsewhere, . 276
Free style of practice best, ... 277
Dictation.—Record of examinations, . . 278–9
Instances of best and worst work, . . . 280–6
On the whole, dictation *not satisfactory*, . . 287
Dictation in *Church schools*, ... 288
,, *Christian Brothers' schools*, . . . 289
Arithmetic.—Mode of examination, . . . 290
Record of examinations at two best National schools, 291, 292
At Edenderry (Portadown), ... 293
Examinations of *Fourth Book* classes, &c., . 296–301
Examinations of *Third Book* classes, &c., . 302–305
Examinations of *Second Book* classes, . . 306–307
Notation, ... 308
Conclusions drawn from examinations, . . . 309
Other subjects:—
English grammar—its value, ... 310
Principles seldom mastered below Fourth Book classes, 311
In non-National schools, ... 312
Geography, ... 313
Mathematics, ... 314
Music, ... 315
Singing, ... 316
General review of secular instruction in National schools, ... 317

SECTION VI.—CERTAIN CHURCH SCHOOLS.

English Church school, ... 320–3
Ballywalter, ,, ... 324–330
Dundonald, ,, ... 331–3
Tullgally, ,, ... 334
Huss ,, (Belfast), ... 335–6

SECTION VII.—CERTAIN INDEPENDENT SCHOOLS.

Belfast Ragged school, ... 338–41
Newtownards ,, ... 342
Mr. Mulholland's schools, Ballywalter, . . . 343
Wesleyan Mission school, Derryinver, . . . 346
These schools generally at a disadvantage as compared with National schools, ... 347

SECTION VIII.—THE HALF-TIME SYSTEM IN NATIONAL SCHOOLS.

Regulations of the *Factory Acts*, . . . 349–50
Two "*sets*" of children employed, ... 351
Alternate plan, ... 352
Certificates of attendance, ... 353
Regulations not adapted to Irish habits, . . . 354
The afternoon "set" does not receive due teaching, . 355
Teachers not to blame for this, ... 356
Effects of the system on the afternoon "set," . 357–8
Why the alternate day system is not adopted, . . 359
Schools should be *specially adapted* to half-timers, . 360
The difficulties referred to have hindered the spread of the half-time system, ... 361
But it is now extending itself rapidly, . . . 362
Factory schools are *under-officered*, ... 363
Instances:—Pilot-street school, ... 364–5
Work done by the half-timers, ... 366–8
Winetavern-street school, ... 371–3
Leeson-street school, ... 374
Campbell's-row school, ... 375–7
Ardoyne and Milewater Mill schools, . . . 378
Net result of half-time system in Belfast, . . . 379
Ignorance of *full-time* factory girls—Crumlin-road Convent Night school, ... 380–2
Moral benefits of the school, ... 383
The *religious difficulty* in factory schools, . . 384–5
Solved by *secularization*, ... 386
Denominations of half-timers, ... 387
Factory schools in villages near Belfast, . . . 388
Whiteabbey school, ... 389
Whitehouse school, ... 390
Harmonious working of *mixed system*, . . . 391
Ligoniel and the *separate system*, ... 392–3
The Wolfhill Mill school, ... 394
The Wolfhill school, ... 395
No genuine competition between them, . . . 396
Contrast between *mixed system* at Whitehouse and *separate system* at Ligoniel, ... 397
The Print Works Act, ... 398–9
Character of children's employment under the Act, . 400
Old Park Print Works National school, . . . 401
Examination of the "Tearers," 402–5
Results of a specially favourable working of the Act, . 406
Actual attendance by "Tearers" at this school, . 407

Paragraph

Injurious effects of uncertain attendance, . . . 408
Review of defects of half-time system, . . 409–10

(1.) *Ignorance of children at entrance*, . . . 411
Testimony of master of Wolfhill Mill National school and others, ... 412
Suggestion to admit no children below Second Book class, ... 413

(2.) *Unsuitable character of factory schools*, . . 414
Testimony of Mr. Inspector M'Ilroy, . . 415
Schools should be specially adapted to half-time system, ... 416–7
Opinion of a millowner, ... 418–9
Allowance of teachers should be increased, . 420
And their presence throughout be secured, . 421
Arrangement of hours at Ligoniel village National school, ... 421
Arrangement of hours at Wolfhill National school, ... 422
In either case half an hour sacrificed, . 423–4

(3.) *Early age of admission allowed by law*, . . 425
Opinions of millowners and clergy, . 425–6
Age should be advanced from 8 to 10 years, . 427
Objection to the change not substantiated, . 428
Evasion of the law by parents, . . . 429
Instance at Whitehouse, ... 430–1
Summary of suggestions, ... 432–3

SECTION IX.—CONVENT SCHOOLS.

Four Convent National schools in the district, . . 434
Anomalous position of Convent National schools, . 435
Comments thereon by friends and foes, . . . 436
Occasional ignorance of clergy of the Established Church concerning National system, . . . 437
Instance as touching convent schools, ... 438
Recognition of convent schools gives a handle to enemies of the National system, ... 439
Suspicions of lax adherence to rules of the Board in convent schools, ... 440
Tokens worn at Lurgan Convent school, . . . 441
"Children of the Holy Angels," "Children of Mary," 441–2
Number of children admitted to the orders, . . 443
Tokens worn on occasion of visit, ... 444
Would be objectionable in a mixed school, . . 445
Distinction between *periods of religious* and *secular instruction*, ... 446
The intermediate prayer, ... 447
Secular books required to be laid aside at religious instruction, ... 448
Direct internal communication from school to convent, 449
These matters trivial in themselves, but important in the National system, ... 450–1
Special regulations concerning Convent National schools, ... 452

(1.) *Nuns not examined*, ... 453–4

(2.) *No "assistant" teachers allowed*, ... 455
Complaints of the nuns at Belfast and Armagh respectively, ... 456
Injury caused by rapid succession of monitresses, ... 457
Monitresses might be permitted to stay longer, 458

(3.) *Payment on average attendance only*, . . . 459
Regardlessly of number of teachers, . . . 460
Objection raised by some because nuns' salaries go for general conventual purposes, . . 461
The Crumlin-road Convent school, Belfast—record of examination, &c., ... 463–76
The Hamilton-street Convent school, Belfast—record of examination, &c., ... 477–84
The Lurgan Convent schools—Record of examination, &c., ... 485–96
Social distinction between two schools at Lurgan convent—comparison with two other girls' schools, 497
The Armagh Convent school—nuns of the Sacred Heart, ... 500
Record of examination, ... 501–7
Comparison with another girls' school, ... 507
General comparison of convent with other girls' schools, ... 508
Conclusions drawn, ... 509–10
Rivalry between *convent and model schools*, . 511–2
Case at Lurgan—entries on rolls of model school when first opened, ... 513–4
Present state of rolls—action of Commissioners of National Education, ... 515–6

Paragraph

SECTION X.—CHRISTIAN BROTHERS' SCHOOLS.

Institute of Christian Brothers, ... 517
Its *principles and original aim*, ... 518–9
Its *present position*, ... 520
The Belfast schools are *rivals to the model school*, . 521
The Brothers no longer seek the poorest boys, . . 522
Nor do they in effect teach them gratis, . . . 523
Their *competition* depresses Roman Catholic National schools, ... 524
The Brothers at Armagh, ... 525
Parents' choice between Brothers' and National schools, 526
The teaching staff, ... 527
Ready permission given to examine, ... 528
Record of examinations at Donegall-street, Barrack-street, and Armagh, ... 529
Two noticeable features—*regularity of attendance* in Belfast schools, ... 530
And *small teaching staff*; its effects in *reading and writing*, and in *arithmetic and grammar*, . . . 531
Inequalities in the school work, ... 532
The Armagh school, ... 533
Order and discipline kept by the Brothers, . . 534
Necessitated by small number of teachers, . . 535
Moral tendency of the system, ... 536
Religious exercise at Donegall-street school, . . 537

SECTION X.—CONCLUSIONS.

Practical conclusions to be drawn, ... 538
Two primary objects—*political* and *educational*, . . 539
The political question turns on choice between a *non-sectarian* and a *denominational* system, . . . 540
Argument of the Roman Catholic hierarchy, . . 541
Two distinct questions raised, one touching *National*, the other *Non-National* schools, ... 542
National schools, ... 543
Interests of the people require that schools should not be denominationalized, ... 544
Summary of defects to be remedied, ... 545
Tendency of remedial measures, ... 546
Required to replace *semi-denominationalism* by principle of *combination*, ... 546
Religious instruction in each school for all or for none, 547
Difficulty when managers refuse to combine, . . 548
Importance of *complete equality*, ... 549
Possible adhesion of *clergy of Established Church*, . 550
Improvement of *teachers' emoluments* and *status*, . 551
Non-National schools—convent schools being denominational should be treated as such, . . . 552
And aided by grants on system of *payment by results*, . 552
Examination of the Nuns thus rendered unnecessary, . 552
Should system of *payment by results* be extended to *all National schools?* 553
Other denominational schools, ... 554
When should they be aided? 555
The National system would not be endangered by recognition of denominational schools to this extent, 556
But an educational advantage would be gained, . 557

APPENDIX A. Page
Sources of income of country Church schools in county Armagh, ... 242

APPENDIX B.
Form of inquiry addressed to head teachers, . 242

APPENDIX C.
Form of inquiry addressed to clergy, managers of schools, &c., &c. 243

APPENDIX D.
Replies to inquiry concerning the mixed system of education, ... 243
(1) From clergy of the Established Church, 243
(2) From clergy of the Roman Catholic Church, ... 245
(3) From Presbyterian and other Protestant Dissenting clergymen, . . 245
(4) From laymen of various denominations, 246

APPENDIX E.
Communication from the Non-Subscribing Presbytery of Antrim, ... 247

APPENDIX F.
Extract from pamphlet of Vere Foster, esq., . 252

APPENDIX G.
Communication from R. Patterson, esq., F.R.S., on natural history in National schools, . . . 252

SUMMARY OF REPORT.

The Report commences with a description of the district assigned for inquiry, and the number of primary schools it contains; explains the method of inquiry pursued, namely, first by means of printed questions addressed to teachers of schools; secondly, by means of questions addressed to managers of schools, clergymen, and others; thirdly, by means of visits of inspection to the schools, and examination of the children. It is mentioned that schools of all kinds readily submitted to examination. Notice is taken of the extent to which prompting is practised both by teachers and children. INTRODUCTION, 1–11

The first subject treated of is the *extent and character of the school accommodation.* The supply is described as being in general ample for present demands; usually in country districts one school to from 500 to 800 of population; instances are given where the schools, chiefly National, are far too near one another, and are all struggling to maintain themselves. This is chiefly the case in rural districts. In towns, if anywhere, a deficiency of schools may be traced, *e.g.*, in Newtownards. In Belfast the fault is that the schools are badly distributed, often in direct competition with one another. The quality of the accommodation often very bad; instances are given at Carrickfergus and in Belfast of buildings quite unfit for schools, ... SECTION I. 12–72

The *attendance* at the schools is next noticed, and it is shown that the average attendance is less than two-thirds of the names on the roll; in Belfast some 8,000 children daily absent from school. Suggestions for improvement are noticed, tending towards a plan of indirect compulsion on the principle of the Factory Acts. Some statistics are added showing the ratio of children on rolls and in average attendance to total population at Belfast, Lurgan and other places— SECTION II. 73–109

The *management* of schools is divided into three heads; cases where the patron is an individual clergyman, in which the schools are *quasi* denominational; cases where the patron is an individual layman, in which there is less denominationalism; and cases where the management is exercised by a committee. Under the last head, the history of the committee of management of Dr. Sullivan's schools at Holywood is detailed, ... SECTION III. 110–171

On the subject of the *teachers*, notice is taken of the precarious nature of their position under their patrons, of their qualifications for their duties, and of their emoluments. The last are described as utterly inadequate, and it is shown how the teacher is often dependent entirely on his Board salary, his fees being depressed or extinguished by competition with other schools, and the patron providing no local aid. A plan is suggested for an improved mode of exacting fees, ... SECTION IV. 172–237

The subject next treated of is *instruction.* With respect to *religious* instruction three forms in actual practice are noticed, namely, religious instruction for all denominations separately in the school, for one denomination only, and for none at all. The first and last are shown to be alone free from the charge of inequality. *Secular* instruction is taken in detail under the several heads of reading, writing, dictation, arithmetic, and other subjects. The work of different schools in the more important subjects is recorded and tabulated, ... SECTION V. 238–317

A separate notice is then introduced of certain *Church schools*, which are not of a character to be classed with the other schools whose work is recorded in Section V., ... SECTION VI. 318–336

A few remarks are next added concerning some schools maintained independently of any society— SECTION VII. 337–347

The consideration of the *half-time system* pursued in the Belfast mills occupies the next section. It is pointed out the regulations are entirely unsuited to the habits of the people, and that the half-timers do not really obtain the due amount of schooling provided for by the Act. The schools are not adapted to the mill-children, and are under-officered. Some notice is taken of each of the Belfast factory schools, and the educational results recorded. A school which receives children under the Print Works Act is also described; and a summary is given of the alterations which appear to be called for in the Factory Laws, so far as young children are concerned, SECTION VIII. 348–433

Convent schools form the subject of the next section. Their denominational character is explained; notice is taken of the special regulations of the Board concerning them; and a separate description is given of the examination of each of the four convent schools in the district. A comparison is instituted between convent schools and other girls' schools, showing their relative efficiency for purposes of secular instruction. The position of the Lurgan convent school in competition with the model school is specially noticed,— SECTION IX. 434–516

The *Christian Brothers' schools* are then described: the position occupied by these schools in Belfast is pointed out, the results of the examination of the schools are recorded, and their general characteristics noticed, ... SECTION X. 517–537

Finally some practical *conclusions* are drawn from the facts previously recorded, . . SECTION XI. 538–559

Report of D. C. Richmond, Esq., Assistant Commissioner.

Introduction.

1. My Lords and Gentlemen,—I beg to present to you the following Report of the inquiries which, by your instructions, I have made into the state of primary education, and the practical working of the National system of education, in Belfast and portions of the counties of Antrim, Down, and Armagh. I entered upon this task with a deep sense of the responsibility with which it is surrounded—a responsibility increased in my case by the populousness of the district assigned to me, and the extreme importance of laying before you a faithful picture of the educational phenomena which it presents.

The district assigned for inquiry.

2. The district comprised the town of Belfast, with a population now estimated at 160,000 or 170,000 inhabitants; the constabulary districts of Antrim and Carrickfergus in the county Antrim; the constabulary district of Newtownards in the county Down; the city and constabulary district of Armagh, and the constabulary district of Portadown, including the town of Lurgan, in the county Armagh.

Number of schools it contained.

3. An analysis of the schools which this wide district contains, supplied to me from your office, which though not complete, is sufficiently accurate for aggregate quotation, gives a total of 466 primary schools, of which 332 are National schools, eighty-one in connexion with the Church Education Society, fifteen under the Board of Erasmus Smith's Charity, and the rest of various independent kinds.

Method of inquiry pursued.

4. It was obviously impossible to visit each of these schools in the space of time allotted to me for my inquiry; but I considered it to be of importance that my investigations, though necessarily imperfect, should, in some form or other, cover the whole of the area with which I had to deal. I thought also that it would be satisfactory to the teachers who are deeply interested in the work of the Royal Commission, if they each—that is each principal teacher—had an opportunity of making written communications to me when there was no chance of an interview between us. Accordingly, I framed a few short questions, and addressed a copy to the head teacher of every primary school of a public character, whether National or not. Almost all these forms were returned to me duly filled up, and not a few teachers expressed their gratification at being allowed a voice in the inquiry. These returns were useful to me in many ways. They assisted me in the selection of schools for inspection; they supplied me with some valuable statistics, relating to the sources of income on which different kinds of schools subsist; and they gave me the mind of the teachers on one or two of the leading topics in the educational problem of Ireland. These questions are reprinted in the Appendix B.

Questions addressed to teachers.

Questions addressed to clergymen, managers, and others.

5. For similar reasons I framed a set of questions to be sent to clergymen, managers of schools, and others, who might be likely to assist me with their advice, or supply me with information. This form is reprinted in the Appendix C. I endeavoured to give this form as wide a circulation as possible. I therefore sent a copy to every resident minister, whose name and address I could ascertain, of every religious denomination throughout my district. I also sent it to such of the leading gentry, manufacturers, and other laymen, as, I had reason to believe, were able and willing to assist me. In all, I distributed about 350 of these forms, and received replies to 150. Some portions of these communications are printed in the Appendix. Protestant clergymen of all kinds showed generally great willingness in replying to my queries. The Roman Catholic clergy were exceedingly reticent, and only five members of the priesthood sent in replies. The scantiness of the written opinions I collected from this body, as compared with the communications of the Protestants is, however, of less importance than might be supposed. I have every reason, judging from the sentiments they expressed to me in conversation whenever I met them, to believe that the Roman Catholic clergy in the diocese of Down and Connor are nearly unanimous in reflecting the determined championship of a denominational system of education advocated by their Bishop, the Right Rev. Dr. Dorrian, and that on this, the pivot on which all controversy turns, their replies, if they had been given, would have been but a series of unvarying repetitions. Under what I may call the less stringent regime of the Armagh diocese, I might probably have obtained some variety of sentiment on this subject—at least in my interviews with the country priests there I found a less uncompromising spirit evinced, and I met with instances in which the mixed system of education was regarded with no unfriendly eye. I think it right to draw your attention to this attitude of reserve assumed by the Roman Catholic clergy with respect to this inquiry, and to add that the impression I gathered in the course of conversations with them, in which some of them spoke their sentiments freely, was, that they refrained from communicating with me chiefly on the ground of the general crusade proclaimed by their hierarchy against the principle of combined instruction under any conditions; that, in fact, asking for a complete subversion of the existing system, they did not care to assist in an inquiry which might lead merely to an improvement in the details of its administration, and thereby tend to strengthen the present establishment.

Examination and inspection of schools.

6. The greater part of my time was occupied in visits to the schools themselves, and in the examination of the children. I paid visits of inspection to 155 distinct schools, comprising 116 ordinary National schools, four convent National schools, three schools taught by Christian Brothers, twenty-six Church schools or private schools under Church management, and six of other kinds. Of these 155 I examined ninety-seven, or counting separate male and female departments as separate schools, 117, namely, seventy-seven ordinary National schools, the four convent schools, and the three schools of the Christian Brothers, twenty-eight Church schools, and five others. Some of these schools were very large, and occupied me more days than one; especially was this the case in Belfast, where, for instance, I spent three days in examining the Crumlin-road convent school, and again, three days in examining the Christian Brothers' school in Donegall-street. In some cases, I examined but a portion of the school, selecting two or three or more specimen classes; in others, I went through the whole school, my course of procedure being regulated by a regard for the importance of the particular school, and by the measure of confidence with which, as I went on, I felt able to form a general estimate of the whole school from my examination of parts of it. I usually examined the children in all the subjects they professed, excepting religious knowledge, which I thought it best not to touch.

Readiness of the schools to submit to examination.

7. I am happy to be able to state that I obtained ready admittance to the schools, and was never hindered in carrying out my wish to examine any school of any kind. The Christian Brothers gladly welcomed my visits, and gave me every facility for my examinations; and I wish to express my sense of the courtesy displayed to me by the Brother Directors both at Belfast and at Armagh.

Introduction.

8. Equal opportunities were afforded to me at all other schools, which, being independent of the State, might perhaps have pleaded reasons for exemption from inquiry. Some of the better Church schools evinced a strong desire to be examined, and thus to enter the lists with the National schools. The National schools, habituated as they are to a system of State inspection, generally treated my visits very much as a matter of course; and as the teachers in ordinary National schools look hopefully to the Royal Commission to do something for the improvement of their position and emoluments, they received me almost invariably with pleasure, and were usually anxious that their scholars should do well before me. None were more ready to meet my wishes than the ladies who conduct the convent National schools. They showed deep interest in the work of the Royal Commission, and in Belfast especially they eagerly followed the course of the examination. To the Lady Superior of each of the convents in my district my acknowledgments are due for their kindness and attentiveness.

Practice of prompting by the teachers.

9. One drawback to the satisfaction of examining schools in Ireland I must briefly mention. Though there are not a few schools free from the imputation I am about to record, I regret to say that the prevalent sense of fairness and justness in an examination is, on the whole, decidedly low. I refer not only to the children, who in some schools have a sort of organized system for prompting one another, but more especially to promptings on the part of the teachers. If I can exempt any one class of schools from this charge, so far as it affects teachers, it is the schools of the Christian Brothers; but of this class my specimens were not numerous. In National schools—not excluding those under the conduct of nuns—great vigilance is required to check the propensity to prompt; and if it is not invidious to make the distinction, the propensity is more largely developed in female than in male teachers. As I have included the convent schools in this remark—and the convent schools in my district are only four in number—I think it due to the convents at Armagh and at Lurgan to say that I exonerate them from the charge entirely. In some ordinary National schools the prompting by the teachers assumed a degree of openness perfectly ludicrous. Of course there was a degree of flagrancy at which I interfered to stop what was going on; but before doing so I sometimes allowed matters to pass for a while, in order that I might see the process at its highest development. I have known a mistress so secure, as she thought, in her position and adroitness that, while the whole class saw my detection of her mouthings, she alone was unconscious of it, till I addressed a remark on the subject to the children, when she hastily retreated, and scarcely came within speaking distance of me again. The position which a teacher takes up during a *viva voce* examination, if he or she intends to prompt, is close beside the examiner, and a little behind him, if possible, the object being to keep as nearly as possible in the line of sight from the class to the examiner; but unless the class is a very small one there is usually one part of it which cannot transfer its attention from the examiner to the teacher without a sufficiently palpable movement of the eyes. When you have once ascertained that this sort of movement is going on, it is not difficult to show the teacher your suspicion; and in this manner I usually checked all the attempts at unfair dealing at the commencement. But I always augured badly if I found a teacher taking up the position I have described.

Due in part to frequent inspection.

10. I have no doubt that the perfection which prompting has evidently attained in some National schools is a fruit of the system of frequent inspection to which they are subjected. It is the more necessary that the Inspectors of the National Board should be awake to the subject. A few words from them in their "Observation Book" would soon check the practice by making it unremunerative.

Plan of this report.

11. The plan which I have followed in drawing up the following report is very simple. I deal first with the general topic of the extent and quality of the existing school accommodation, and the attendance of scholars at schools of all kinds. I go on to discuss the great body of the primary schools, consisting of ordinary National and Church schools, under three heads, relating to their managers, their teachers, and the instruction they afford. I next treat of factory National schools, and the half-time system, then of convent National schools, and, lastly, of schools of the Christian Brothers. Finally I endeavour to gather from the materials at my command some general conclusions to which they seem to lead.

Section I.—Extent and Character of School Accommodation.

Two questions—extent, and quality of accommodation.

12. One of the first matters to which my attention was directed was the sufficiency or insufficiency of the existing means of education for the working classes, in point of mere accommodation in school buildings, independently of the quality of the instruction provided in them. Are there schools enough to receive all the children who want to attend school? Or are some children prevented from attending for the reason that there is no school for them to attend? Following upon this arises the further question—is the character of the accommodation which the schools afford such in point of quality and suitability as to meet the requirements for effective organization and instruction?

Supply of schools in general ample for present school-going population.

13. 1. On the first question, concerning the adequacy of the existing school accommodation for the present school-going population, the result of my inquiries points unmistakably to the conclusion that, except where special causes of a temporary kind are in operation, the supply of schools is in general ample. The replies I received to an inquiry on this subject which I circulated throughout my district bear something like unanimous testimony to the fact.

Only two cases of deficient supply named.

14. Only two rural districts were specially named to me as being deficient in schools, and they both lie just at or beyond the limits of the district assigned to me for inquiry. Mr. M'Auley, the Roman Catholic priest at Kircubbin, in the county Down, speaks of a portion of his parish south-east of Kircubbin, as being in much need of a school; and in the county Armagh, Mr. Bell, a Presbyterian minister at Clare, near Tandragee, while expressing his opinion that there are schools enough generally, makes an exception with respect to a district lying between Tandragee and Poyntzpass, where he says a school is wanted. One clergyman at Lurgan said that there were several districts in the country round that town where "education is very inadequately provided," but at least so far as the number and accessibility of the schools is concerned his statement is not borne out by the opinions of the country residents themselves.

Usual state of things in rural parishes.

15. The usual state of things in the rural districts is pretty fairly represented by the following description of the parish of Killyman, in the county Armagh, which was supplied to me by the Rev. James Disney the Rector. Unlike the majority of the Anglican clergy, Mr. Disney does not reject the National system of education. He writes—

"This parish (speaking roughly), is in extent about four miles by two; it contains about 2,000 Church Protestants, and 1,000 Roman Catholics. There are in it six schools for primary instruction in connexion with the National Board, and one private under Mr. Richardson (a Quaker).

"These schools are so situated that no child in the parish is more than a mile from a school, in which it can be taught reading, writing, and arithmetic. Five of the schools in connexion with the National Board are under my management, and one under that of the parish priest."

16. If, instead of five National schools under the management of the Rector, we say five National schools under the management of various Presbyterian clergymen, we have, I think, a very fair picture of the ordinary country parish in the counties of Antrim and Down, where the Presbyterians predominate. And again, if, instead of five National schools under the Rector, we say three Church schools under the Rector, and two National schools under Protestant lay patronage, the description will apply with sufficient accuracy to the average country parish in the co. Armagh. Of course many parishes are of far larger extent than Killyman and contain proportionately more schools; and in some parts of the counties of Antrim and Down the Roman Catholic population is so sparse that there is no school under the priest's patronage, while in portions of the county Armagh the Roman Catholics are in the majority, and have accordingly more schools. But so far as the mere supply of schools is concerned, the above description may be taken to be, *mutatis mutandis*, a fair representation of the case. School Accommodation.

17. The usual proportion of schools to population in rural parishes seems to be about as one school to from 500 to 800 of population. I take a few of the largest rural parishes in my district. Proportion borne by schools to population in rural parishes.

Parishes.	Population in 1861.	Number of Schools.		Proportion of Schools to Population.
		National.	Other.	
County Antrim.				
Ballynure (including Ballyclare),	3,521	6	1	1 to 503
Connor,	7,710	10	2	1 to 642
Duneane,	5,658	7	–	1 to 808
Drumaul (including Randalstown),	9,511	10	3	1 to 731
County Armagh.				
Loughgall,	7,469	6	6	1 to 624
Kilmore,	10,982	5	8	1 to 844
Tartaraghan,	7,483	7	3	1 to 748
Tynan,	6,532	3	8	1 to 593

18. I have only taken separate school buildings into account in the above list of schools, though in several instances there are separate departments for boys and girls. I have inserted no parishes from the county Down solely because my district contained no large parishes in that county free from an urban element; but I have no doubt that the northern portion of the county Down is at least as well supplied with schools as either the county Antrim or the county Armagh.

19. I think that it may be at once conceded that one school is enough for 700 or 800 people, if only it be accessible to them all; and as regards accessibility, not only the testimony of others, but all that I have seen myself of the country I visited, goes to show that the schools, far from being so wide apart as to leave portions of the country around them practically uncovered, are constantly interfering with one another's areas; and that a parent not only has no difficulty in finding a school within easy reach of his cottage door, but has far more frequently a difficulty in determining whether he shall send his child to this school or to that. As I shall have occasion to notice under another head, an almost universal complaint is raised by the teachers of country National schools that there are far more schools than are really wanted, and they are all bidding one against another for children. Schools frequently so numerous as to interfere with one another's areas.

20. In the immediate vicinity of Ballyclare, a village of some 900 inhabitants, in the county Antrim, every school I visited made the same complaint, that it was too near its neighbours. In Ballyclare itself there are two National schools, one of which having separate departments for boys and girls, stands for two in the books of the National Board; and besides these, there is a Church school. In the National school "No. 1 male," thirty-three boys were present; in the female school, twenty-six girls. In the National school No. 2, there were thirty-six boys and forty-eight girls present; and the Church school, which I did not see, has, as I was told by the officiating clergyman, about a score of very young children. About a mile and a half off is a school vested in the Commissioners, called Doagh male and Doagh female National schools, where I found twenty-eight boys and thirty-six girls in attendance. The population of Doagh is returned in 1861 as 271. The mistress of the girls' department had lost part of her salary on account of the smallness of her numbers (her average for 1867 was only 20·7), and by dint of great exertions, she was now hoping to recover her loss. This she had done by aid of children from outlying places, and her two highest girls came from a village named Kilbride, which has a National school of its own. Ten of her pupils, too, were mere infants, whom she took in from their mothers for nothing, to help out her numbers. About a mile from this is Newmills National school, where I found nineteen boys and fourteen girls, and the master complaining that besides being so near to Doagh, he was not a mile from Ballyvoy National school, and a short mile only from Dunamuggy. Kilbride National school, about a mile from Doagh, and the same distance from Newmills, is barely a mile from Cogrey Mills National school, not much more than a mile from Ballyvoy, and about a like distance from a Church school at Ballybracken. At Kilbride I found eighteen boys and fourteen girls in attendance. When one school in such a district flourishes, its neighbours are in difficulties, and the small attendance at Kilbride was accounted for by the success of a new mistress at Cogrey Mills, where I found thirty boys and forty-six girls present. To these schools I should have added Palantine National school, about a mile from Doagh, in a different direction, where twenty-six boys and thirteen girls were in attendance. Instance of schools around Ballyclare, Co. Antrim.

21. These schools all lie in the country west of Ballyclare. I did not explore the other side, but a glance at the map shows that the same state of things exists there. Some three or four National schools lie within a mile or a mile and a half of Ballyclare on that side.

22. Returning to the schools I visited, I would call attention to two necessary consequences of this profusion. The schools must have a small number of pupils, and generally inferior teachers; because a high class teacher can do better for himself at a larger school. The facts will appear more clearly from a tabular statement. I give the area of each school building, in order to show what is the extent of accommodation provided, and how far the accommodation is actually utilized. Consequence—small schools under low-class teachers.

[Table.

TABLE.

School Accommodation.

National Schools.	Area of School-room in square feet.	Accommodation at 8 square feet per child.	Number present.	Grade and Class of Teacher.
Ballyclare, No. 1, Male,	432	54	33	1st grade of 1st class (aged).
Do. do. Female,	432	54	26	1st grade of 3rd class.
Do. No. 2,	Held in a temporary wooden hut.			2nd grade of 2nd class.
Doagh, Male,	450	56	26	1st grade of 3rd class.
Do. Female,	450	56	36	Do. do.
Newmills,	375	47	33	Probationer.
Kilbride,	588	73	32	1st grade of 3rd class (depressed in 1867 from 2nd grade of 2nd class).
Cogrey Mills,	594	74	76	1st grade of 3rd class.
Palantine,	320	40	39	Do. do.

Schools but half full,

23. Thus we find, omitting Ballyclare No. 2, which is at present unhoused, only two of the other eight schools were full. The remaining six, having accommodation for 340 children, had 186 in attendance; they were, in short, little more than half full; and the vested school at Doagh, by far the most complete building of all, was as poorly attended as any.

And chiefly under low class teachers.

24. Then as regards the teachers, out of the whole nine only one has a first class classification; his school is now in a poor way, and he himself ripe for superannuation; one other has a second class certificate; and these two teachers are in Ballyclare itself. All the outlying schools are under third class teachers, except that one is under a mere probationer. When I add that in my own experience either a small school or a school under a third class teacher is rarely if ever in a satisfactory state, the significance of this list of schools to which for the most part both these conditions are attached, may at once be estimated.

Vested school at Doagh.

25. There are very few vested school-houses in my district, and what I saw of them in country places led me to think that they have not always been placed wisely. This school at Doagh will illustrate my meaning. It may be right and proper to expend the public money upon a school-house in a village however small, if it will be accessible to a sufficient outlying population. This is exactly the case at Doagh. The village is small, but the country round it is well peopled. But then the relevancy of this argument for building a vested school is negatived by the recognition which is granted to a network of non-vested schools all round Doagh. The mistress of the girls' school allowed there was no question that the population of Doagh did not supply sufficient occupation for two principal teachers; she was quite sure that the work would be done better if her own school were merged in the boys' school, though of course she does not wish to see this done, and to become an assistant only; and so she struggles on with an attendance which in October, 1867, had fallen as low as 13·3 on an average. On such a number both building and teacher are wasted.

Vested schools at Kilroot and Bellahill.

26. The same want of economical care is exhibited in the case of an excellent vested school-house at the village of Kilroot near Carrickfergus. It is situated just out of the village of Eden, which has a non-vested National school of its own, distant about a quarter of a mile. About a mile and a half from Kilroot school is another vested school at Bellahill. The Bellahill school is under a first class mistress, and suitably situated. It was full to overflowing when I visited it. The Eden National school is but an infant school, and as such is useful in taking off the youngest children. But after this, and with the Bellahill school within reach, there remains but a poor field for the Kilroot school. And yet this has by far the best building of the three. I found at Bellahill fifty-six children present in a room twenty-four feet six inches by fifteen feet, which at eight square feet per child would accommodate only forty-six. It is about to be considerably enlarged, and will then not improbably still further increase its attendance. The Eden school had sixty-two little children present—the mistress a probationer only. The building would hold considerably more. The Kilroot school consists of one excellent room, thirty-nine feet long by nineteen feet ten inches broad, and about eleven feet high to the eave course, with an open roof. It would hold 100 children well. It is in excellent repair, well whitewashed, and well supplied with apparatus, including eleven parallel desks. I found thirty-one boys and twelve girls in attendance, who, of course, did not half fill the room. The whole number on the roll was fifty-four boys and twenty-nine girls. The master was a very young man, his classification first grade of third class. He is aided by a female assistant and a paid monitor. Such an establishment as this, which from the erection of the building in 1860 to the present time must have absorbed a considerable sum of public money, appears to me to be out of all proportion to the usefulness of the school. If the Eden National school were not in existence, Kilroot might do well enough with a separate department for infants, and if there were but a successful school at Bellahill it might attract scholars from the country in that direction; but planted as it is it will probably never be full.

Profusion of schools at Woodburne, near Carrickfergus.

27. Perhaps the most egregious instance of profusion with which I met was at Woodburne, a village some two or three miles from Carrickfergus. Its population does not appear separately in the census, as it is, I believe, included in the parish of St. Nicholas, Carrickfergus. It is, however, a mere straggling village with a factory in it, and a few hundred inhabitants. It contains three separate National schools, each for boys and girls combined. There is Woodburne National School, and Upper Woodburne National Schools, Nos. 1 and 2. Upper Woodburne is a continuation of the village, on the rise of a hill. The schools are all by the same roadside, and a few minutes' walk apart from one another. The attendance, as I found it, was as follows:—At Woodburne National School, which until a recent date was the only National School in the place, 27 boys and 36 girls. The accommodation here is very indifferent. The master resides in three gound-floor rooms, and overhead is the school-room, reached by a sort of ladder, by no means free from danger to small children. The room itself is cramped, and covered with desks, and would not well accommodate more than 50, though there were 146 on the roll. This is the chief school in the place in spite of its disadvantages. Upper Woodburne, No. 1, is a cheap ricketty structure, more like a barn than a school. Its area is large, the dimensions being 35 feet by 22 feet. The roof is on a continuous slope, from 12 feet at the highest to 5 feet at the lowest. Here I found 20 boys and 19 girls, while the area would accommodate nearly 100. The third school, Upper Woodburne, No. 2, has the only good building of the three. It was built for a church, and still contains a pulpit, but is now given up to educational purposes. Its dimensions are 51 feet by 19 feet, and it is 14 or 15 feet high. It would accommodate 120 children well. Here I found 8 little boys and 8 little girls, under a female probationer. These she had gathered about her by aid of her patron, a clergyman of the Established Church, and a very lenient system of school fees, while row after row of empty desks, continually reminding her of the greatness of her opportunities, in the meantime only make her class look the smaller, and the farce which is being enacted under the title of National education the more ridiculous. Thus I found 118 children in attendance at these three schools. The whole number would barely have filled the single school-room

belonging to Upper Woodburne, No. 2 school. The perpetual jealousies and feuds to which this exaggerated and purposeless competition is sure to give rise, are obvious. Nor is there here even the excuse which is urged in many cases on the ground of denominationalism. There is, indeed, an admixture of Roman Catholics in the population, though the majority of the people are Presbyterians; but there is no separate school for the Roman Catholics. They were distributed over the three schools, two of which are under Presbyterian, and one under Anglican patronage. Upper Woodburne School No. 1, the second of the three in seniority, was established about three years ago, and according to the statement of the master of the old school in a very peculiar way. The master says that he had on one occasion punished a boy for fighting, by giving him two or three switches in school. The boy was a farmer's son, and went home and told his father. The father resenting the punishment removed his boy from the school, and being then a member of the school committee, brought the matter before that body. They, however, would not interfere, and the farmer thereupon set about getting up a rival school. The old school being of inadequate size, a new school was not an unreasonable thing, though to enlarge the old school would have been a better and less expensive course to adopt. In this way the very unsuitable building used for Upper Woodburne School No. 1, was erected; it was afterwards taken in hand by one of the Presbyterian clergymen of Carrickfergus. The first effect on the old school was that the master lost his assistant, on account of his diminished attendance, but he has since recovered this. It might be urged in favour of the course pursued by the Board in this instance, that either an enlargement of the old school, or the erection of a new one had become a necessity. But no such excuse can be advanced on behalf of the third school, which has been recognised still more recently. The only recommendation that school has is its building, and if the other two schools were closed, this would be a very good ground for securing so suitable a house for school purposes. But as long as the two older schools are continued, the existence of Upper Woodburne School No. 2, under an unclassed teacher, entails a pure waste of money and labour, and imperils the position of both the other schools, by further subdividing the small field out of which each of them has to extract a subsistence.

School Accommodation.

28. If there is a deficiency of school-buildings anywhere it is not in the rural districts, but in the crowded towns of Belfast and Newtownards; but in them too the deficiency is not in the abstract number of schools, or in the aggregate amount of accommodation they offer, but it arises from the unequal and unsystematic distribution of the schools.

Deficiency of schools, if anywhere, in towns.

29. Newtownards is a densely populated town of some 10,000 inhabitants, largely engaged in hand-loom weaving. It is a poor town, therefore, and affords a fine scope for the beneficent action of the National system of education. It was accordingly deemed a suitable site for a model school, and a magnificent building has been erected no doubt at heavy cost, for its accommodation. But the poorest of the inhabitants are not benefited by this, for the regular exaction of fees in advance withholds the weavers generally from making use of the model school. Besides the model school, there is a large and overflowing ordinary school, under the name of Newtownards National School, managed by a Presbyterian clergyman, and there is a considerable school, called Anne-street National School, attended exclusively by Roman Catholics, and under the patronage of the parish priest. These two schools have an attendance of about 250 children. The model school has about 300 more. For the rest of the town the provision is very inadequate. There is a large school under the Board of Erasmus Smith, managed by the Rev. J. G. Pooler, the incumbent. This, however, is very unsatisfactory in the girls' department, which I examined; the boys' school was closed for repairs on the day when I proposed to examine. There are three more National schools, one under a third-class teacher, is an ill-arranged and far from satisfactory school, and the other two are under probationers. One large and very poor district of the town is at some distance from any but a ragged school, which is maintained by a committee of benevolent persons, under the superintendence of Presbyterian clergymen. But it hardly deserves the name of a school. A widow woman and her boy have some 50 boys and girls, crowded into a cramped up-stairs room, where the children are chiefly occupied in spelling out words from the New Testament. As a temporary expedient, while a National school was in course of organization, even such a school as this might be slightly better than nothing. But the present school has been going on for nearly seven years, and permanently subtracts half a hundred children from the National schools of the place. When I find National schools broadcast over the land in thinly peopled parts, it becomes a matter of surprise and regret that a densely populated district should put up with a mere nursery such as this is. It is true that no part of the town is very far from a National school, all but very young children would be able to traverse it without difficulty; but even if the parents were in a position to exercise a choice between one school and another on its merits, they are deterred from doing so by two supreme considerations, first, that the ragged school is free of expense, and second, that it is ready at their very doors. In a town, it is a matter of very great importance to have a school near at hand; a parent, however neglectful in matters educational, is thoughtful enough in guarding against bodily dangers, and though the competition of the schools in many places will draw some children off to more distant schools, there will always be many parents who are satisfied to send to the nearest school, because it is safest and most convenient to do so. If this ragged school were simply closed, many of the children would no doubt go to one or other of the National schools, while some would probably go to no school at all. If a good National school were established in its place, not only would it afford these children an education worthy of the name, but it might, perhaps, extinguish one or two of the inferior schools with which it would come into competition, and the whole town would be benefited if it did.

In Newtownards.

30. Several of the clergy in Newtownards concur in regarding the school accommodation of the town as very inadequate, and the schools themselves inconveniently situated.

31. Yet, in the immediate neighbourhood of the town the phenomenon which so often meets the eye in the rural districts of a superabundance of small schools, under inferior teachers, is seen in full operation. About a mile out of Newtownards is Ballycullen National school, the master of which lives in the town, from which he also draws an appreciable proportion of his scholars. He is a second-class teacher, and, with the aid of the children from Newtownards, keeps a considerable school—seventy-one were in attendance, nearly filling the room. About a mile from Ballycullen, and still about the same distance, or little more, from Newtownards, lies Killynether National school, under a third-class master—forty-seven children were present. About half a mile from Ballycullen, and a mile and a half from Newtownards, is Greengraves National school, where I found thirty-four children under a third-class master; and Ballyrogan National school, still within a mile or so of Newtownards, is within a short walk of both Ballycullen and Greengraves. Ballyrogan is also under a third-class master, and had forty-three children present.

But profusion in country around Newtownards.

32. Here were nearly 200 children, living within a radius of about a mile from a central point, distributed among four different principal teachers, none of whom are men of high qualifications. If these four schools were replaced by two large schools, first-class teachers might be obtained, and still a saving of expense be secured.

33. In the county Armagh, though there is still a great abundance of schools—quite as great as in Antrim or

School Accommodation.

National schools less abundant in Co. Armagh.

But Church schools far more numerous.

Down—the causes are different. The abundance does not arise so much from profusion on the part of the National Board as from the competitive action of the advocates of the National system on the one hand, and the supporters of the Church schools on the other. On a rough calculation there are in the counties of Antrim (without Belfast) and Down about 760 people on an average to each National school. In the county Armagh there are about 1,020 to each National school. The difference is made up by the large number of Church schools in the neighbourhood of the cathedral city. The analysis of the schools of various kinds in my district supplied to me from the office of the Commission, gives the proportions of National and Church schools thus:—In Belfast, 8 Church schools to 71 National; in the constabulary districts of Carrickfergus and Antrim, 18 Church schools to 123 National; in the district of Newtownards, 15 Church schools to 64 National—on the whole, 41 Church schools to 258 National. Whereas in the districts of Armagh and Portadown the proportion is 52 Church schools to 74 National; in the district of Armagh alone, without that of Portadown, there are returned 33 Church schools to 34 National, or, in effect, an equal number of each. I have already given the number of schools—National schools and Church schools combined—in the four largest agricultural parishes in that portion of the county of Armagh which came within my inquiries, and shown that the proportion they bear to the population is very much the same as is the case in the county Antrim. But in proportion as there are more Church schools in Armagh, so is there a less profuse distribution of National schools, and the National schools are rarely found in competition with one another.

Case of Belfast; diversity of opinion concerning adequacy or inadequacy of school accommodation.

34. In the town of Belfast it was not easy to form a trustworthy estimate of the adequacy of the existing school accommodation. One is met by contradictory statements and by conflicting phenomena. Thus the Rev. John Scott Porter, an earnest advocate of National education, in reply to my inquiry, says the means of education "are amply sufficient, or, as I should rather say, more than sufficient." The Rev. E. J. Hartrick, honorary secretary to the Down and Connor and Dromore Church Education Society, and incumbent of the Magdalen Church, Belfast, says "the means are not sufficient for educating children above twelve years of age or under eight, night schools being required for the former and infant schools for the latter. But for children between the years of eight and twelve I believe the means of education are sufficient at present."

35. The Rev. William Johnston, who has taken a leading part in the promotion of National education in Belfast, and is patron of eighteen schools in the town, gives it as his opinion that the efforts that have been made to provide new schools for the rapidly increasing population of the place have succeeded in supplying means of education "well proportioned to the requirements of the community;" but he adds that already some new districts in the town require additional provision.

36. These opinions, which are corroborated in the main by the majority of those whom I had the opportunity of consulting, are in accordance with the estimate of the District Inspector, Mr. M'Ilroy, who, speaking of the northern and western portions of the town, in which the increase of population has been most conspicuous, describes the schools as "amply sufficient."

37. On the other hand, the Rev. Robert Hannay, incumbent of Christ Church; the Rev. Hugh Hanna, and several others expressed their opinions that there is a deficiency of schools; others contented themselves with complaining of the badness of the accommodation offered in many of the existing schools; and the Revs. W. Martin, A.D.M., and James Canavan, C.C., agree in saying that there are not schools enough for Roman Catholic children, meaning schools under Roman Catholic management. Mr. Martin adds as a special cause of their need, the fact that their "conscientious scruples will not permit them to use the model school."

Grounds for both opinions.

38. My own observations lead me to believe that both these who say that there are schools enough, and those who cry for more, have fair grounds for what they state. I visited the greater number of the schools in Belfast, and what I found was, *here* a school so overcrowded that even the playing-yard would be called into requisition as a class-room—*there* a room entirely fallen into disuse. In one school, the teachers would be at every shift to compress the children within the walls; at another the children would be solicited to come in and occupy the empty benches. Out of about fifty schools I visited in Belfast, I should say a dozen were certainly not full; the rest were frequently very much overcrowded. Balancing the one against the other, I am inclined to believe that the prevailing opinion is correct, that there is, on the whole, accommodation in school-buildings for all the present school-going population; and that the contrary opinion is based upon a partial experience only of the means which exist. A clergyman, who is manager of a good school, always more than full, feels his want of further accommodation, and may be little aware of the empty state of a school in the next street. There is no concert between the one school and the other, though there may be a rivalry, and thus it is, that the one manager thinks the schools are too few, and another may consider them too many. The truth is, that the real deficiency in Belfast arises not from the number of schools being too great or too little, but from the want of any system upon which the placing of the schools has been regulated. In some parts of the town the schools are too many, in others too few. One street will have two rival National schools *vis-à-vis*, another will be far from any school. I will give an instance or two. Within the precincts of Trinity Church, are the Trinity street National schools—boys, girls, and infants, in separate departments. They are under the management of the incumbent, and are all full. Close by stand Stanhope-street National schools, also containing three separate departments. The boys' and the girls' schools are fine rooms, fifty feet long, by seventeen feet broad, and fourteen feet high. They would accommodate 120 children each, but the total attendance in the two schools was only 110 on the 26th of August. The schools are not half full, and this fact explained the meaning of a placard which several times met my eye on the walls of the town, and which struck me as something exceedingly novel in connexion with a National school. I give it *in extenso*:—

Wants of Belfast due rather to bad distribution than insufficiency.

Instance—the Stanhope-st., Trinity-st. and Clifton-st. schools.

"Stanhope-street National Schools.

"*Teachers.*—Boys' school, Mr. Lauther, Principal; Girls' school, Mrs. Rankin, Principal; Infants' school, Miss Smyth, Principal; and a staff of thoroughly qualified assistants.

"These schools, which are strictly non-sectarian, have been re-opened after the Midsummer vacation, under the management of the above-named teachers, who were chosen solely on account of personal qualification. Public examinations are held each year for the purpose of testing the progress of the pupils, and affording parents an opportunity of judging the character of the instruction imparted, when prizes are awarded by the patroness, Miss Whitla, for proficiency and regular attendance. In addition to a first-class English and Mercantile education, the course of instruction includes drawing, music, and fancy needlework.

"*Evening Classes.*—The male and female evening departments are conducted by Mr. Lauther and Mrs. Rankin, on Monday, Wednesday, and Thursday evenings, from seven till nine o'clock.

"Special attention is given, in both the daily and evening schools, to reading, writing, arithmetic, drawing, and plain and fancy sewing.

"Terms on application at the schools."

39. I have no reason to believe that there is any exaggeration in the terms of this advertisement.

40. The manager, the Rev. J. Scott Porter, does not speak without a reason when he implies that there are too

many schools in Belfast. Quite recently, although the Trinity-street and the Stanhope-street schools were already occupying the ground, the Board has sanctioned another large school facing the Stanhope-street school, and not a stone's throw distant from it. It is called Clifton-street National school, and is built at the back of the Rev. J. M'Credy's meeting-house. Nothing but the road, at a place where four ways meet, separates it from Stanhope-street schools. It was opened in May, 1868, and at once a rush of children took place from Stanhope-street schools to this, for a minister can always command an attendance from his own congregation. The two schools are now in obvious competition, the one relying upon its acquired reputation, the other on the support of the minister to whose meeting-house it is attached, while as yet it has its reputation to earn. This new school consists of a fine large up-stairs room, intended, as the master said, for 300 children, and a ground-floor room not yet called into requisition. I found 129 children already in attendance on September 16th.

School Accommodation.

41. From the denominational point of view nothing is more natural than that a minister of religion should desire to have the control of a school for the benefit of his congregation. Most of the clergy in Belfast have schools, and why should not Mr. M'Credy have his as well? But it is quite another question whether the National Board, which in theory at least holds to the non-sectarian view of education, should encourage this promiscuous establishment of quasi-denominational schools, without having at least assured itself that a real need is being supplied by doing so. In this particular instance the process of multiplication pursued by the Board has been this. The first of these three National schools was the Stanhope-street school. It is an isolated building, unconnected with any place of worship, and one of the most suitable and complete school buildings in Belfast. It has as fair a claim to be called non-sectarian as any school, excepting the model school, in the whole town. The Trinity-street schools are within the precincts of Trinity Church, approached through a gate which leads also to the sacred building, and they were till two years ago not under the National Board, but managed in accordance with the principles of the Church Education Society. Upon the accession of the present incumbent, the Rev. J. H. Deacon, they were placed under the National Board. Thirdly, in May, 1868, the Clifton-street school also received the support of the National Board. Both the Trinity-street and the Clifton-street schools have a distinctly denominational character; they are both in juxtaposition with a house of worship, and naturally enough enjoy the support of their respective ministers. Placed as it is between these two schools and without the same associations with places of religious worship, the Stanhope-street school, though representing the principles of the National system far more completely than the other two, in vain struggles to maintain its position against them. The attendance at Stanhope-street and Clifton-street schools together would just fill the Stanhope-street schools alone. The Clifton-street building would be invaluable half a mile off.

Two denominational schools and one non-sectarian covering the same ground.

And a non-sectarian school is at a disadvantage in the competition.

42. A somewhat similar state of things, though less strongly marked, exists in Conway-street, where the Board has just accepted a new school under Roman Catholic management, situated almost *vis-à-vis* to Conway-street National school, No. 1, which is under Presbyterian management. The older school is perfectly full, the new one has room to spare. Very probably the new school may also soon be full, but it appears to me that to allow the existence of two schools in such patent rivalry in the same street is to sacrifice all regard for judicious distribution to the appetite for sectarian display. Conway-street is in a new part of the town, where there must be a wide choice of sites for school buildings, and the selection under these circumstances of a spot confronting an existing National school, as the most desirable site for a new school, is suggestive of a deliberate purpose, which it should be the business of the Board, professing to represent the spirit of non-sectarian education, to repudiate.

Two schools in Conway-street.

43. When a town increases at such a wonderful pace as Belfast has done, it is no doubt extremely difficult to adapt from time to time the supply of schools to the wants of the population. The urgent need of additional school accommodation year by year has been met by the independent exertions of clergymen of different persuasions acting each with an especial regard for the interests of his own denomination. I do not mean with a deliberate view to proselytize, though the indirect results may savour of propagandism; but what, for instance, a Presbyterian minister does is this: he collects subscriptions, he buys a site, and builds a school; he becomes the patron of it, he appoints a staff of Presbyterian teachers, and by these means plants in a new district a stronghold of religion and learning, and provides for all the Presbyterians around exactly what they want. He is glad enough if children of other persuasions will attend his school; he is glad if Roman Catholic children will come and take, if not the religion he offers them, at least the secular learning provided. I have no doubt that in establishing his school he has a direct purpose to assist the poor of all denominations to learn to read and write; but he has also a second purpose in view, and that is that facilities for reading the Bible may be afforded to members of his own congregation. In many instances the school buildings serve a double purpose: they are National schools in the day, and on certain evenings in the week they are places of meeting for religious purposes. They are missionary schools and missionary churches too. When he has done this for the Presbyterians, it is not surprising if the Church Education Society comes in with a school which will give Church people special religious instruction; and it may be safely assumed that the children of the Roman Catholic faith will be provided for at a third school.

The placing of the schools determined by independent action of rival ministers of religion.

44. The effect of this independent action of different bodies is either that the schools are planted, as in the old and densely populated parts of the town, wherever sites could be obtained, and without any regard to relative positions; or else, as in the new districts of the town, the spirit of antagonism prompts the promoters to get their schools as near together as possible. I have already cited Conway-street schools as an instance of the latter course of action; the former is illustrated by the schools in Kent-street, which lies in the midst of one of the poorest and most thickly peopled districts in the town. There could be no better field for missionary efforts than this; it is reputed to be a refuge of all the vice which can be gathered together in the least reputable portion of a great manufacturing town. The houses are miserable hovels, which let for a shilling or fifteen pence a week; the people are described, both by the clergy and the teachers, as mainly drunkards, prostitutes, and thieves. Kent-street National school, Kent-street Free school, under the Church Education Society, and Fountain-square National school share this unlovely neighbourhood among them. The pioneer was the Kent-street National school, which is under the patronage of the Rev. William Johnston. It is a feeble school, not full. Out of forty-three children present only six were above the first reading book, the master is a third class teacher, and the fee is one penny a week.

Schools arise either in avowed antagonism, as in Conway-street, or indiscriminately, as in neighbourhood of Kent-street.

Kent-street National school.

45. The Church school is entirely free, and to this fact and the small gifts which are to be obtained at most Church schools, may be ascribed its larger attendance; it has about seventy children, mostly of the Established Church. The school-room presented a scene of extreme disorder when I visited it, and the standard of acquirement was very low.

Kent-street Church school.

46. The Fountain-square school contains two rooms of equal size, one of which is entirely disused, the other not more than half full. It is under the patronage of a Protestant layman, a Dissenter; who pays £26 a year as rent for the building. The building itself appears to have been obtained by knocking down the partition

Fountain-square National school.

School Accommodation.

walls of two houses, by which means two large rooms, awkwardly shaped, have been made available, of these only the up-stairs one is used; and although the exaction of fees is almost entirely given up, it is only by great exertions and solicitations that the mistress maintains an attendance of some thirty or forty children. The number I found actually present was but twenty-four.

Three weak schools in place of one strong one.

47. Here there are three weak schools where there should be one strong one. I have no doubt the neighbourhood has children enough to fill all three, if all attended as they might do; but I am convinced from observations in many places that to bewilder the people by too many schools and to drive down the cost of schooling to zero by means of competition for children, is not the way to promote regularity of attendance or appreciation of the advantages of education. The National Board, cannot, indeed, unite these three schools; but it might, perhaps, unite two of them, and make out of the combination, if not a very strong school, at least one less weak.

Opinion of Rev. L. Hünges.

48. It would not be difficult to quote other instances in which a very bad economy has been exercised in the establishment of small competing schools in other towns besides Belfast. I entirely concur in the wisdom of the following remark by the Rev. Leonard Hünges, of Carrickfergus, who says:—

Schools should be amalgamated.

"There are two many schools in this town (Carrickfergus). If several were amalgamated, the salaries of the masters and teachers, the buildings, the proper distribution into classes according to age and progress, could all be improved without incurring any greater expense."

49. The principle of that remark is, I believe thoroughly sound, and should form the starting point of any large measure of administrative reform in the Irish National schools.

In quality, the accommodation often very bad.

50. II. Many of those whom I consulted urged that what was wanted was not more schools, but more good schools, and I do not hesitate to say that a large proportion of the school-buildings, which I visited, especially those in towns, are totally unfit for the purposes to which they are devoted. I believe it to be a very difficult, I had almost said an impossible thing, to hold a good school in a thoroughly bad building. I have indeed heard it suggested that there is a certain appropriateness in the extemporized buildings often used as schools in Belfast; for that these buildings are more in accord with the habits and manners of the children who attend them, and that their very homeliness is a recommendation to them in the eyes of the poor. Nothing that I have seen gives me any faith in this view of the matter, and all experience in school management seems to point the other way. After visits to many scores of schools my recollection usually associates disorder and noisiness with bad, cramped, and awkward school-rooms; with large, airy, well-arranged rooms are apt to be combined a tone of orderly quiet and precision. There are good schools in bad buildings, and bad schools in good buildings, but a certain amount of confusion is inseparable from a large school badly accommodated, and in a good room, even though the teaching be inefficient, a certain sense of order is almost inherent. Mr. Hünges had good reason to refer to the improvement of the school-buildings in Carrickfergus. One of the National schools there, called the Market-place National School, is in appearance one of the most disreputable buildings I ever saw. On the front towards the Market-place I counted eleven broken windows, some of them stuffed with paper to keep out the wind, others not. Inside, it contains two rooms on the ground floor, of which one was full of dust and dirt besides a heap of old reading "cards," supplied by the National Board, otherwise it was entirely untenanted; the other is used at times as a class-room, especially for religious instruction. Out of this room rises a ladder, up which one mounts into a first-floor room covering the whole area of the building, and used as the ordinary school-room. It is a forlorn looking room, with some very rickety desks, on which the master gravely remarked, that "they shake quite too much," as though a small oscillation were in itself not undesirable. I should rather have said that on such desks it was almost impossible for anyone to write, and quite impossible for a child to learn to write properly. Out of this room another ladder leads up to a large garret, by no means proof against wind and rain, and containing no windows, as windows are generally understood, but only two apertures with wooden shutters. The furniture consisted of three long low benches. This is the room in which the girls are taught to sew. These ladders, by which the ascent to the room is made, would be dangerous or even insurmountable for young children, and the duty is entailed on the assistant teacher of making frequent journeys up and down the steps to accompany the infants whenever any one of them has to leave the room. The spot to which they are then conducted is situated, strangely enough, between the front of the building and the public street, in full view of every passer-by. It would, indeed, be difficult to find a building more entirely unsuited to educational uses than that occupied by the Market-place National School in the borough of Carrickfergus.

In Carrickfergus:—(1.) The Market-place National school.

(2.) Lancasterian-street National school.

51. Two other schools in this town occupy premises very far from satisfactory. The Carrickfergus Female National School, in Lancasterian-street, owns two large rooms, one over the other, which were apparently obtained by the fusion of several small houses. The upper portion only is occupied. It is a long, narrow, disjointed sort of a gallery, in very indifferent repair; it is only fifteen feet wide at the widest part, and narrows to about twelve feet at one end; its length is no less than seventy-six feet. Beneath this, on the ground floor, the same area is divided into two damp and dreary rooms, sometimes utilized as play-rooms, but generally quite disused. Once a boys' school was held here, but that has long been discontinued; and the girls are not numerous enough to fill the upper half of the building. Here, too, the same fault was to be found with the desks: they were all but falling to pieces, and would alone make it impossible for any girl ever to write well.

(3.) Barnmills National school.

52. The third school-house, to which I refer, is occupied by the Barnmills National School. The building, as mistress informed me, was, in the first instance, erected for a public-house. After serving in that capacity for some time it was turned into a Presbyterian chapel, and eventually, a year ago, into a National school. The pulpit still stands, casting a semi-sacred character over the otherwise very unimpressive appearance of the room, or barn as it should rather be called, for with the exception of a partial wooden floor, it bears none of the usual features which distinguish places of human habitation. The school is a small one under a third class female teacher; indeed no teacher of good standing would ever accept a school held in a building the very aspect of which is repellent and depressing.

In Belfast:—(1.) North Thomas-street National school.

53. In Belfast there are not a few school-buildings as unfit as any in Carrickfergus. For instance, the North Thomas-street National School ought, as it appears to me, to be at once proscribed altogether. It is situated in a small court, just out of the street. All along the side of the building, and separated from it by a mere footpath, stands a row of privies belonging to houses which rise up higher than the school and effectually prevent the free circulation of air. All the windows of the school open on this side of the building, and the dilemma continually trying the patience of the teachers is whether it be better to open the windows and admit the unwholesome stench, or to keep them rigidly closed and be stifled. Adjoining the offices of the houses in front, and just outside one of the windows of the school, stand the offices belonging to the school, and a more disgracefully foul sight than they presented it is impossible to conceive. I visited the school on a warm rainy day in August. On entering the ground-floor room, which is appropriated to an infant school, I found the atmosphere painfully oppressive; the door was open, but of five small sash windows, all in one side of the room, two were closed. I asked the reason why they were not open, for the mistress complained that she was suffering from the foulness of the air. The reply was, that one of them, being level with one of the rows on the "gallery," could

never be opened lest an infant should fall out of it; the other was so close to the school offices that if opened it would make the room uninhabitable. The dimensions of this room gave a total of 3,760 cubic feet of air, less the space occupied by a rising gallery; thus the rate of eighty feet per head would give accommodation consisting with health to not more than forty-five persons. There were present eighty-one children and three teachers, and the average attendance for the preceding quarter had been eighty-six. To make such a state of things at all healthy a free circulation of air is indispensable; but a thorough draft can never be got, and the air which can be admitted wafts in with it the most nauseous and unhealthy vapours. Up stairs, where a mixed boys' and girls' school is held, there was scarcely any improvement. Four small windows, low down in the wall, were capable of being opened half way; these, as below, were all on one side, overlooking the offices of the neighbouring houses. In the slope of the roof were six small windows, which of course cannot be opened in wet weather. The master assured me that the air was never, in the most favourable circumstances, other than oppressive, and that in the hottest weather he had taken the lower windows out entirely, and yet the thermometer stood at 93°. The worst periods of all occur about six times a year when the offices belonging to the houses are cleaned out; this is done in the day time, and during the process the air in the school becomes scarcely bearable. The cubical contents of the upper room were about 5,000 feet (including the open roof), which would be sufficient for sixty-two persons. There were present seventy-four children and four teachers. In this school, be the teachers as careful and attentive as they may, the first rules of health and decency are continually and unavoidably violated.

School Accommodation.

54. In point of mere ventilation, but happily without the same impurities of atmosphere, there is a National school in Spier's-court, which is even worse constructed than that in North Thomas-street. The school is held in a single room on the ground floor: the upper portion of the building is used for other purposes. The school-room is an irregular apartment, 35 feet long at the longest part, and 22 feet 6 inches broad at the broadest part; the height varies from 8 to 8½ feet. The whole cubical content, as nearly as I could ascertain it, is from 4,500 to 4,600 feet. The means of ventilation are two doors, windows on one side of the room only, and a stove. Supposing the means of ventilation were sufficient, the room would be fit for at the most 60 persons. The average attendance for the quarter ending June 30, had been 118, and there were 4 teachers besides.

(2.) Spier's-court National School.

55. I could name several other schools in Belfast in which a similar state of things exists, that is in which the cubical content of the room allows far less than 80 feet for each child in attendance. I will instance one more, as the school is a large and important one. The Bridge End National school, in Ballymacarrett, had an attendance in the boys' school of 130 on the day of my visit. The room would accommodate 70. Some relief is obtained by means of a small space, unfloored and without fireplace, which has been covered in, and is used as a class-room, but it hardly deserves to be taken into the account. Fortunately the school possesses ample play-room, and in summer the classes are chiefly taught out of doors.

(3.) Bridge End National School.

56. Here, as in very many cases, I had occasion to notice the extreme foulness of the offices: a mild entry by the Inspector in the Observation Book, that they were "dirty," entirely fails to characterize as it deserves to be characterized, the inexpressible filthiness of what I saw. I am informed that there is no system of sewerage in Ballymacarrett; but even this fact, if it somewhat palliates the offence, cannot excuse those who are responsible for the health of these children.

Foul state of the offices.

57. I will dismiss this particular branch of the subject, by saying of the schools in general, that in a very great number of instances, both in town and country, the provision made for training up the children to respect the rules of decency and cleanliness—I am speaking especially of National schools—is astonishingly insufficient. The schools of the Christian Brothers are in this respect a model, which it is not unreasonable to expect that the National Board may ere long think it right to imitate.

This is a frequent defect in National schools.

58. In country schools standing on open sites, no great difficulty is ever likely to arise about ventilation. They can always command a supply of fresh air, though, if the day is a little cold, the teachers are often very unwilling to make proper use of their opportunities. But I not infrequently found that the actual accommodation fell far short of the requirements of the English Committee of Council.

In country:—

59. For instance, at Ballyeasborough National school—a large and flourishing school in the county Down—the cubical contents amount to about 6,650 feet, sufficient for eighty-three persons. But there were present 153 children, besides five teachers and a workmistress.

(1.) Ballyeasborough.

60. At Ballywilly National school, near Portadown, the room was completely blocked up with children standing all over the passage, and projecting even into the high road. The master says that in summer weather he teaches chiefly in the road, and in bad weather it is often impossible to do more than just keep the children quiet. A new school-house is to be erected shortly.

(2.) Ballywilly.

61. At Aldoo National school, near Carrickfergus, the cubical content is 2,816 feet, which would suffice for thirty-seven or thirty-eight children. I found seventy in attendance, besides two teachers.

(3.) Aldoo.

62. At Hunter's-lane National school, too, in Donaghadee, which is an exceedingly satisfactory school in point of teaching, success has been attained under extreme difficulties in respect of accommodation. The area of the girls' school is eighteen feet by thirteen feet six inches, or 243 square feet, which, at the rate of eight square feet for each child, would suffice for thirty. The cubical content of the room was about 2,592 feet, or sufficient for thirty-two children. There were present sixty-one, besides mistress and monitress. The boys' school is rather larger, and less full. A new school is, I understand, to be erected soon in lieu of this.

(4.) Donaghadee.

63. A very common defect in a country school is that it possesses only a mud floor. In dry summer weather there is no great disadvantage in this, if only its surface be tolerably even; but generally it is very far from even, and not rarely, it is so dotted over with pit-falls that great circumspection is required as one moves about the room. In the winter these holes probably perform a useful service in draining the wet from the rest of the floor; but their purpose in the summer is less easy to divine. In winter there can be no question that a damp clay floor is most disagreeable and deleterious to half-clad shoeless children. I can bear witness to my own unpleasant recollections of a visit to a mud-floored school on a wet October day. Even with boots on one is forcibly reminded of the ague as the cold creeps up from one's feet, and one begins to appreciate to the full the boon which Mr. Vere Foster has conferred on so many hundreds of National school children by providing them with wooden floors to stand upon.

Mud floors.

64. To put it shortly, the chief fault to be found with National school buildings is this—that in towns they are apt to be extemporized out of existing hovels; in country places they are often mere barns, with desks in them.

65. Wherever a building has recently been erected for the express purpose of a school, there is little or no fault to find. Many of the newest schools in Belfast are all that could be desired in point of airiness and comfort; but in many instances rooms have been sanctioned by the National Board for which aid should never have been allowed. Without asking for complete conveniences, it should be insisted that the building be in accordance with the laws of health, and so placed and arranged that it may be possible for the work of a school

Buildings erected expressly for schools, usually quite suitable.

School Accommodation.

to go on with propriety and order in it. When the State allows so much in the form of annual support, it may fairly demand that the locality provide a room that will do justice to the grant.

Want of play-grounds.

66. One special desideratum deserves to be noticed. A great many of the town schools have no play-grounds whatever, and this want is found in some of the most successful schools in Belfast. Linenhall-street National school, for instance, has not a square foot of play-ground, and little more can be said for Victoria-place National school. Many have a mere yard of a few feet square, which cannot be used for play, and is only available for other purposes. Some schools more fortunate have what in a town like Belfast must be considered a handsome provision. The Townsend-street schools, those attached to St. George's Church, in High-street, those in Stanhope-street, and some others, all have a space in which it is possible for the children to recreate themselves with some sense of enjoyment. The same may be said of the Huss Church school, and the school of the Christian Brothers in Barrack-street.

Temptations to irregularity and truancy, in default of play-grounds.

67. In a town school, in which the class of children is low, and the tendency to irregularity and truancy very strong, the want of a play-ground becomes a very serious obstacle to effective organization. At about mid-day the children are always turned out for half an hour or so, during which they eat a piece of bread, which they have brought with them, and if there be a play-ground join in a game there. If there be no play-ground they turn out into the street, and probably go home for their piece of bread; and many a child who has come in the morning never re-appears in the afternoon. There are, in fact, two temptations to truancy per diem instead of one; and as the roll is called before twelve o'clock, absence in the afternoon passes unnoticed in the daily report book, and the teacher has no direct personal interest in the attendance after once the books have been made up for the day.

Accommodation in Convent Schools, and Christian Brothers' Schools.

68. In what I have said about the kind of accommodation which the schools afford I have hitherto instanced only ordinary National schools. The convent National schools that I saw all have excellent school-rooms, and all have play-grounds of greater or less extent. At the Armagh and Lurgan convents the play-grounds are best. At the Belfast convents, especially in Hamilton-street, they are, as might be expected, only large yards, but still more than most National schools possess.

69. The schools of the Christian Brothers are all held in good airy buildings, and in this respect leave little or nothing to be desired.

In Church Schools.

70. Of the Church schools, taking one with another, I should say that they are neither better nor worse, in respect of buildings, than ordinary National schools. Those that are under the Board of Erasmus Smith always have ample rooms, and are usually well kept. The poorer schools, under the Church Education Society, are of all degrees of excellence. Sometimes, as at the Church schools in Carrickfergus and Randalstown, and one or two new schools in Belfast, they can compare with the better class under the National Board; while in some country places they are pictures of neglect and decay. One thing, however, can be said in favour of the country Church schools under the Education Society. There is seldom any fear about the cubical contents being insufficient for the health of the children; a score of children generally have the place all to themselves.

Conclusions concerning extent and quality of accommodation.

71. To return to the general subject of school accommodation, my belief is—First, that a deficiency of accommodation of some kind or other is exceedingly rare, and may almost be said to be non-existent. Secondly, that a very considerable part of the existing accommodation, whether in National or Church schools, is very bad, and quite unfitted for educational work. Thirdly, that the fault lying at the bottom of the matter is that the work of education is too much subdivided. Schools are got up promiscuously without concert one with another, but rather for the purpose of rivalry; and the effect is that a lot of small, cheap, inferior schools are doing the work that would be better and even more economically done by a few large schools. This is equally true of town and country.

How far the National Board might remedy the evils.

72. The remedy is easier or more difficult in proportion as the work is more or less in the hands of the National Board. In Belfast, and in the counties of Down and Antrim, the National system so vastly preponderates over all other agencies that the reform required is an internal one only. The Board should set to work to fuse and amalgamate its small competing schools. I am aware that a difficulty would arise in connexion with non-vested schools, which are the property of private individuals, and over which the Board exercises but partial rights. Still the path to negotiation lies open, and the Board has a *locus standi*, from which it might act between rival patrons of schools. In the county Armagh the difficulty is of a different nature. It can hardly be said that there are too many National schools there; but education is quite as much subdivided through the rival action of the Church Education Society. It is hopeless to expect that Society to merge itself in the present National system, and therefore, as things are, the Board is powerless to remedy the evil.

Section II.—School Attendance.

Duration of school life and regularity of attendance.

73. The subject to be treated of under this head depends, in the main, on two elements: the duration of school life and the regularity or irregularity of the attendance. If every child within given limits of school life, were in daily attendance at school, the system would be so far perfect. If by any external causes some be cut short in their school life, and removed from school altogether, the system is incomplete only in so far as these particular children are withdrawn from its sphere of operation. A further element of incompleteness is introduced if even those who are not so withdrawn attend school but fitfully and irregularly.

Causes which shorten the period of school life, especially in Belfast.

74. Both these causes are largely affecting the operations of National education in Ireland. In Belfast, where the demand for juvenile labour is great, a large number of children are withdrawn at an early age, to earn a few shillings in connexion with different departments of trade. The girls are attracted chiefly by the demand for "doffers" in the spinning mills; the boys are employed by the shops to run errands and deliver goods. Work in the mills is, by virtue of the Factory Acts, combined with a half-time attendance at school for all children below thirteen years of age, and the doffers, therefore, though drafted off into the great body of the working community, are returned to the schools by force of law; the rest, when once they have been taken into employment, are for the most part lost to the schools, until at a more advanced age self-interest may induce them to try to recover at a night-school what they have sacrificed in their childhood. It seems clear that nothing short of legal restrictions can avail to protect children in a thriving mercantile town from the attractions to early employment which everywhere surround them. In exchanging school for work they are but supplying an ever-present demand; and as long as the demand is allowed to assert itself without restraint, so long will there be parents who will gladly sacrifice the education which they value little, for the shillings which they value much. No doubt the state of things which has hitherto existed will be very much modified in process of time, by the operation of the recent Workshop Act, which places young children employed in any kind of works

under protection analogous to that provided by the Factory Acts for those employed in factories. But as yet there are no traces of the benefits likely to arise from this enactment, the very existence of which, indeed, did not appear to be at all generally known. School Attendance.

75. The need of some such legislation, however, is very apparent. At one of the night-schools in the town, attended chiefly by boys and girls of more than thirteen years of age, a boy of only twelve years told me that he had been employed for four years, twelve hours a day, in a biscuit factory, and during this time had never been able to attend any but a night-school. Until he was eight years old he had attended Kent-street National school, where, according to his own account, he had been in a fourth book class, and had reached compound division in arithmetic. As he was a very intelligent boy, I dare say he was not wrong in his statement. His work compelled him to rise at hours varying from 1.30 to 5, A.M., and as soon as his twelve hours were up he was free to leave. During the summer, while no night schools are in operation, he has had no schooling at all. In the winter he attends three days in the week, in the hope of keeping up his knowledge; but this he has failed to do. He has slid back into the second reading book, which he read to me very indifferently, and has forgotten almost all his arithmetic. His pale face and tired eyes, which could scarcely bear the glare of the gas-light, under which all his reading and writing had to be done, were his best excuse for his relapse into ignorance. His case is the case of many in Belfast, with this difference: that less intelligent boys would have had less learning to forget when they were taken off to work, and would have forgotten what they had learnt more quickly. Instance of a boy attending a night school.

76. It would be well if the early withdrawal to work were the only complaint to be made about the extent of primary education in Belfast. Unfortunately it is but a small part of the matter, and it is one which recent legislation will, in course of time, do much to correct. The graver difficulty is how to deal with those who have no such valid reason to assign for their absence from school—the large class of nominal but irregular school-goers. The greater difficulty is caused by irregularity of attendance.

77. In examining the statistics of National schools, one is struck by the enormous disproportion between the number of names on the school rolls and the number of children one finds actually present. The difference represents the amount of irregularity for the day, and a most portentous waste of opportunities is thereby disclosed. Very rarely, and only in the best schools, attended to a large extent by children of the lower middle class, and in which a fair fee is regularly paid, did I find the attendance to exceed 70 per cent. of the number on the roll. The highest per-centages I met with in Belfast were 76·9 at Eglinton-street National school, and 76·5 at Linenhall-street National school; these were in the autumn, when the attendance is as good as at any time in the year. Some of the schools which I visited in July, or early in August, had not their full complement in attendance, because at that time of the year a good deal of non-attendance arises through the attractions of the sea-side at Bangor and the neighbourhood. The children were "at the shore," I was constantly told; the meaning of which was that they went down daily to some point on the coast of the lough by cheap trains from Belfast. Of course it is only those who are in tolerably comfortable circumstances that can afford this; but wages for skilled artisans are high, and a sober workman need never want in Belfast. The list of schools which I append, with the numbers of their scholars on roll and in attendance, comprises schools visited at very various periods, from July to November. If in some cases I have, for the reason just assigned, obtained a somewhat lower per-centage than would have been disclosed at a later date, I have in others got some of the highest per-centages the schools ever attain to; and, on the whole, these present a fair sample of Belfast National schools, including some of the best. I omit schools attended by factory children, as their case is peculiar, and I have included no separate infant schools; but at both the convent schools infants are received and included in one general total with the other girls. The lowest per-centage, 52·1, belongs to the Roman Catholic National school at Ballymacarrett, under the management of the Rev. G. Conway, P.P., where my visit took place on a fine warm September day, a Wednesday, under circumstances as favourable to attendance as could be desired. Evidenced by disproportion between names on roll, and average attendance.

Table showing average rate of attendance at National schools in Belfast.

School.	Date.	Number on Roll.	Number Present.	Per-centage.
Twelve Ordinary National Schools.				
Ashmore-street,	July 28,	191	125	65·4
Bridge-end,	September 23,	410	215	52·1
Clifton-street,	September 16,	238	129	54·2
Earl-street,	August 10 and 11,	229	128	55·8

Victoria-place,	July 28,	341	208	60·9
Two Convent National Schools.				
Crumlin-road (Infants' included),	September 1 & 2,	710	457	64·3
Hamilton-street,	August 28,	468	272	58·1
Total,	—	4,213	2,620	62·1

78. These 14 schools, then, had 2,620 children in attendance out of 4,213 on their books, or 62·1 per cent. I believe this result would not be improved if I had been able to extend it to all the National schools in Belfast. In the Church schools that I saw, the attendance bore scarcely so high a proportion to the number on the rolls as it did at the National schools; but at the two schools of the Christian Brothers, for special reasons which I shall refer to when I come to speak of these schools, the attendance falls but little short of the complete number on the rolls; in their two schools combined it was 90 per cent. of the full number. Putting their two schools out of the calculation, we have the broad fact that in the rest of the primary schools, tested by a selection containing fair specimens of the whole, and including some of the largest and most successful schools in the town, out of every 100 children whose names are on the school rolls, only 62 are present on a given day; the remaining 38 are Average attendance in Belfast 62·1 per cent. names on roll.

School Attendance.

—where? The streets of Belfast can answer for most of them. At any time of the day, let it be eleven or twelve o'clock, when the schools are fullest, scores of children are to be seen idling about, careless and uncared for, able and ready no doubt to be gathered into the schools under the mildest pressure, but left to follow the whim of the moment, because the parents are too neglectful to exercise that authority which the public good demands should be exercised over them.

In Belfast some 8,000 children daily absent from school.

79. When extended over the whole of Belfast, the calculation gives a result of melancholy significance. There were upwards of 13,000 children in attendance on the 25th of June, 1868, at the Belfast primary schools; if these were 62 per cent. of the whole number of school children on the rolls, there must be some 8,000 children who every day are either kept from the school or stay away of their own accord, in this town. At the Christian Brothers' schools the absentees are about 10 per cent of the whole number. If the same regularity were attained in all the Belfast schools, the daily attendance, instead of being some 13,000, would rise to 19,000, and the absentees instead of being 8,000 would be but 2,000. That such an accession to the school attendance in Belfast is possible, it is unreasonable to doubt. The State cannot, indeed, create for itself the influences which are the strength of the Christian Brothers in the regulation of their schools. Religious enthusiasm on the part of the teachers, and preferential support from the clergy do for the Christian Brothers' schools what no mere perfection of machinery can produce elsewhere. The sentiment of devotion and personal attachment cannot be generated by Act of Parliament, nor is it possible that every school should monopolize the choicest boys in the town; but that another set of influences may be brought to bear on the mass of the people by legislative enactment, and may eventually produce the same statistical results in school attendance, may fairly be hoped.

Attendance in smaller towns and rural districts.

80. Before proceeding to notice the suggestions for improvement which were made to me by many persons with whom I communicated, it will be well to see how the schools in the smaller towns and in rural districts are circumstanced, and whether they will do anything to redeem the picture presented by the statistics of Belfast.

(1.) In smaller towns.

81. At Newtownards and at Lurgan I give the figures for every National school in the place, excepting in either case the model school. At Carrickfergus, besides the model school, I omit one National school which I did not visit. At Comber the two National schools command the whole town, the school under the Board of Erasmus Smith being closed.

* Average for August.

† Average for year ending June, 1868.

Average attendance 61 per cent. of names on roll. In country, average about 60 per cent.

82. These figures give the following aggergate per-centages of attendance on the whole number on the rolls, namely, in Carrickfergus 59·2; in Comber 71·8; in Lurgan 56·7; in Newtownards 63·2. In the four towns combined it is 61, a figure which presents no improvement on the experience of Belfast.

83. Lastly, it may suffice to say of the schools in rural districts, that their case is at least no better than that of the towns, nor yet does it appear to be much worse. The statistics I gathered from 20 of the National schools which I visited in outlying places, not in large villages, give 2,510 children on the rolls, and 1501 in attendance, or nearly 60 per cent. These schools were visited at various times in the months of September and October, and at a few of them the attendance had been reduced by the commencement of the potato digging; this was only in the case of schools in the county Armagh. The names of the twenty schools I have taken into account are—in the county Antrim—Aldoo, Ballyutoag, Bellahill, Cogrey Mills, Doagh, Kilroot, North Taylorstown, and South Taylorstown. The attendance in these eight schools was 541 out of 884 on the rolls, or 61·2 per cent. In the county Down—Ballyeasborough, Clandeboye, Crawfordsburn, and Dundonald. The attendance was 309 out of 462 on the rolls, or 66·8 per cent. In the county Armagh—Aghacommon, Aghanlig, Ballywilly, Blackwatertown, Blundell's Grange, Derrytrasna, Tullysarren, and Tullymore, in which 651 were present out of 1,164 on the rolls, or nearly 56 per cent. The highest proportion was 72·8 at Ballyeasborough, and three others had upwards of 70 per cent. in attendance. The lowest was at Tullymore, 36·2 per cent., reduced by the commencement of the potato-digging season.

Less than two-thirds in daily attendance at National Schools.

84. It seems then that on the whole, taking town with country, the National schools succeed in attracting daily within their walls something less than two-thirds of their nominal scholars.

Attendance in Church Schools.

85. In the Church schools in small towns and country villages the per-centage of daily attendance is often higher than in the National schools. This is due partly to the more frequent rectification of the school roll which is practised in some of these schools, and partly, in the case of especially good schools, to the personal interest taken by the incumbent and his family. By means of small rewards, in the form either of clothing or of money prizes, inducements are held out which the parents cannot resist; and generally it may be conceded that while pressure or persuasion in some form or another is required to secure regular attendance, the advantage is likely

to be rather with the Church than the State school. On the other hand, the inferior Church schools hold their children by an exceedingly weak tie. As soon as potato digging commences in the county Armagh many of the Church schools are almost emptied forthwith. School Attendance.

86. I have mentioned Tullymore National school as having had its attendance reduced to 36·2 per cent. of its number on roll at this season. Its neighbour and rival, the Aughatarragh Church school, only two or three minutes' walk distant, had on the same day only 8 children present out of 49. Aughatarragh.

87. At Eglish Church school, where the roll for September contained 48 names, the attendance on October 21st was 11. Eglish.

88. Even these instances were exceeded in absurdity by the Tullygally Church school, near Lurgan, which I visited before the potato digging had commenced, but, as it happened, on Lurgan market day. The master had 85 children on his books, and an ample though roughly equipped school-room to hold them in. At a quarter to eleven o'clock he had exactly 5 children present. Roused by my unexpected visit, he at once despatched a boy or two to tell Johnny this and Jemmy that to come to school; and so briskly were his directions carried out that by half-past eleven he had assembled 16 children for me. He expressed great regret that I had not given him notice of my coming. If I had done so, he would have had the whole 85 children ready to meet me. I suggested that he should take his notice now, and have them assembled the next day; but he had evidently not reckoned upon the possibility of a second visit, and speedily retracted his hasty promise. Tullygally.

89. The highest per-centage of attendance among the Church schools was at the school under the Board of Erasmus Smith at Loughgall, where it amounted to 76·6 of the number on the roll. I omit the Drelincourt Charity School at Armagh, where there is an endowment providing clothes for all who attend satisfactorily. Disregarding the high attendance (88·8 per cent.) there, and also the other extreme presented by such schools as those at Aughatarragh and Eglish, I take the following ten Church schools in the smaller towns and in country places, namely, at Antrim, Armagh (the "Mall School"), Bangor (the "Lodge School" and the "Boys' Parochial School"), Carrickfergus, Derryadd, Kilmore, Kinnegoe, Loughgall (these four in the county Armagh), and Randalstown. They had 953 children on their books and 621 in attendance during my visits; this is equal to 65·1 per cent. The list includes some of the best Church schools I saw anywhere, and by itself gives a result slightly more favourable than that obtained in the case of National schools. I need hardly say that if the ruck of the Church schools were brought into the calculation the state of things would be reversed; but as I saw some of these last under unfavourable circumstances, it is best for the purpose of comparison to leave them out of the reckoning altogether. Loughgall.

90. The general conclusion then is that in the great body of primary schools, whether of the National or of the Church type, the attendance at any one time is less than two-thirds of the number on the rolls, and falls very frequently far below that rate; that an attendance amounting to three-fourths of the whole number is exceedingly rare, and one of about half only is not uncommon. Average attendance in National and Church Schools together.

91. This unsatisfactory state of things attracts much attention both on the part of managers and teachers, and various means are resorted to and many more suggested by which a remedy is proposed to be applied. So far as plans have been reduced to practice they are chiefly to be found in operation at Church schools, and for this reason, that the Anglican clergy, who manage them, throw the whole weight of their influence and resources to swell the attendance at their schools. The methods to which they resort are chiefly those:—First, they abolish fees, so that no child need begin the week badly if it have not a penny forthcoming; secondly, they institute systems of small rewards, partly in the form of gifts of money, partly in clothes, supplied either gratuitously or at a reduced cost; thirdly, they in some cases give a small daily supply of food to all who come. The principle throughout is to tempt or even to bribe the children to come. Remedies for irregularity attempted in Church Schools.

92. In the National schools none of these means are as a rule adopted, excepting only that the fee is sometimes dispensed with. In the National school it is usually by the teacher, who finds it his interest to get children to come, that inducements are offered; whereas in Church schools this duty is undertaken more completely by the managers. The teacher, of course, has it not in his power to dispense clothes or gifts, and all he can do is to remit his fees, and solicit the parents to send their children. Many a teacher, whose school is not full, acts in this manner; but as he obviously does it rather in his own interest than that of the children, the effect of this form of inducement is injurious and degrading. In National Schools.

93. I am not sure that much more can be said for the method pursued in the Church schools. It appeals to the mercenary and self-interested motives of the parents. In their eyes, the matter takes the form of a bargain, in which either party gives and takes something. "If you engage to give my child a petticoat at the end of the year, I will engage that you may teach her to read the New Testament for so many days in the interval." Such is the view the parent takes of the matter, and the form of the bargain is not calculated to enhance his estimate of the value of the teaching secured by it. Unsatisfactory nature of the remedies.

94. I received very numerous replies to an inquiry which I circulated in my district, inviting suggestions for improvement of school attendance. Eleven gentlemen were in favour of a system of rewards for regular attendance—the plan actually followed in many Church schools. Of the eleven, eight were clergymen of the Established Church, one a Presbyterian clergyman, and two were laymen. The suggestion, therefore, is little more than an advocacy by several clergymen of a method which they actually put in practice, and the failure of which, to meet the necessities of the case, has been already demonstrated. To a knowledge of this failure, and to a conviction that the plan is unsound in principle, may no doubt be ascribed the very small number of advocates which it finds to support it. Suggestions made by various correspondents—

95. In a less direct form, to which the objection in point of principle would not apply, a plan of rewards for attendance may perhaps be made efficacious. At Madden Church school, near Armagh, the plan adopted is, that on Monday morning every child brings a penny, which the master takes into his charge: at the end of the week, if the child has been regular, the penny is returned—if not, it is forfeited. In this way the school is made free to regular attendants, and costs a penny a week to those who come irregularly, and the plan is said to work well. A somewhat similar plan is mentioned to me by the Bishop of Down and Connor and Dromore, who, while expressing his belief that the exaction of fees does much to check irregularity, suggests that at the close of each quarter, a portion of their fees should be returned, in the way of premiums, to those whose attendance had been most regular. The difference between the principle of this suggestion and that of the plan previously noticed is this. In the one case, not only are no fees exacted, but the obligation is presumed to lie the other way, and the schools pay the children for coming to be taught. In the other case, the children are given to understand that schooling is a thing that has to be paid for, but the more they have of it, the cheaper it is. 1. To return all or part of the fees as a premium.

96. A few of my correspondents think they see a remedy in a system of gratuitous instruction, combined with an increase in the salaries of the teachers. That the latter measure would do much to correct the capriciousness 2. To make schooling wholly gratuitous.

SCHOOL ATTENDANCE.

of the present attendance, I do not doubt. As long as National teachers are dependent on the number of children attending their schools for their position with the National Board, so long will the children, amid the multitude of schools, play off one teacher against another, and indulge any momentary pique, by absence or change of school. To strengthen the position of the teacher in dealing with the parents is most desirable. But whether gratuitous education will have any effect in promoting regular attendance, is a question on which all my experience and observation prompts the gravest doubts. The great majority of those whom I had the opportunity of consulting, are decidedly opposed to a gratuitous system, both on ethical and economical grounds; and, moreover, its efficacy to secure regular attendance has already been tested by the Church schools, and their experience ought, as it appears to me, to be conclusive against the prospects of such an experiment.

3. Some form of compulsion by law.

97. By far the greater number of the suggestions I received, embodied some form of compulsion by law. This view of the matter is taken by sixty-four gentlemen belonging to various denominations, some of them clergymen, some laymen, who all replied to my inquiry to the effect that no plan short of compulsion would really meet and grapple with the evil. Some ask for simple direct compulsion, in the form perhaps, as one clergyman suggests, of a fine to be inflicted on the parent of any child found idling instead of attending school. Some would put it in the milder form of a small educational tax, levied upon all, whether the children attend school or not. Many, who do not go the full length of direct compulsion, would see the same effect produced indirectly, by means of a universal educational test, previous to employment in labour.

Balance of opinion in favour of some form of compulsion.

98. I do not apprehend that it falls within my duty to discuss the general question of the desirability of compulsory education. I would rather limit myself to affirming two facts; first, that other plans are being constantly tried, and no one of them has yet been successful; secondly, that so far as I was able to gather the mind of the educated community in my district, the balance of opinion was inclining in the direction of either direct, or at least indirect, compulsion. On indirect compulsion I would make this further remark. The principle of it is already acted upon in the Factory Acts; this has brought the people of Belfast to look a little further, and see whether, the principle being admitted, its application could not be made more perfect. If the law has a right to send a child to school as a condition of its employment in a mill, has it not also a right to refuse it employment unless it can pass a minimum test of knowledge? And if the principle of school attendance during employment is extended, as it has been extended, to workshops, might not the same test be employed there too? and if there, then also universally as an indispensable condition to permanent employment of any kind? The complaint of all the Factory school teachers in Belfast is that they can do little good with the half time children because they come to them so grossly ignorant at first; hundreds of children would begin to attend school there with a will, if their parents knew that age was not the only legal qualification for entry into the mills. That parents would regard an educational test as a hardship, if it were presented to them in the form of a step preliminary to advancement in life, and pecuniary benefit, does not appear at all likely; they will not grudge the trouble of sending their children to school, if they believe it will pay them well to do so. Half the irregularity of attendance arises from the indifference of parents to a matter from which they do not clearly perceive that any direct benefit will accrue. Bring the conviction home to them that education pays, and half the difficulty is surmounted.

Indirect compulsion by means of an educational test.

Objection to compulsion avoided.

99. An eminent statesman has lately expressed his dread of a system of compulsion in education on the ground, among others, that it might lead to a sentiment of repugnance, and that to associate education with any thing oppressive or irksome might go a long way to make all education unpopular. A system of indirect compulsion which would associate education in the minds of the people with prospects of worldly advancement, would not only avoid the difficulty suggested, but would promote the very opposite sentiment.

Practicability of a test in Ireland.

100. With respect to the details of an educational test, and its practical feasibility, it should be recollected that the vast network of National schools in Ireland would render the operation far more certain and the test far more uniform than would be the case in a country so unevenly educated as England.

Statistics of school attendance in—

1. Belfast.

101. I append some statistical calculations, to show what proportion of the population belongs to the school-going class in this district, and what proportion is in actual daily attendance.

102. (1.) I begin with Belfast. Its population in 1861, was 120,554, of whom 29,639 belonged to the Established Church, 42,229 were Roman Catholics, 41,237 were Presbyterians, and 7,439 of other denominations. Since that time the population has enormously increased. Mr. Guthrie the town clerk, kindly furnished me with an estimate of the population, calculated up to close of the year 1868. It is derived from the returns of new houses built. Between 1861 and 1867 there were 8,476 new houses built, and the estimated addition in 1868 was 1,500. At the rate of five persons to a house, the increase in population up to the 31st of December, 1868, would be 49,880, and the total population of the town 170,434. Making some allowance for houses not yet or only partially occupied, Mr. Guthrie thinks 165,000 to be a safe estimate. The census of school attendance taken by the constabulary on June 25th, should be compared with the population on that day, and in order to avoid all risk of overstatement, and to make full allowance for the increase between June and December, I will assume the population at midsummer 1868, to have been 160,000. To the number of children comprised in the census of June 25th, I add 500, namely, 280 for the second set of half timers (being half the number I ascertained subsequently to be in attendance at Factory schools) and 220 on account of three schools closed for vacation at the time of the census. I distribute these rateably among the different denominations; and assuming that the relative strength of the several denominations in the whole town is the same now as in 1861, I get the following results:—

BELFAST.	Estimated Population, Midsummer, 1868.	Children in attendance June 25, 1868.	Ratio of Children in attendance to Population.	Estimated Ratio of Children on School Rolls to Population (attendance = ⅞ names on Roll).
Established Church, .	39,200	3,592	1 in 10·9	1 in 7·6.
Roman Catholics, . .	54,800	3,991	1 in 13·7	
Presbyterians, . . .	56,200	5,754	1 in 9·8	
Other Denominations, .	9,800	430	1 in 22·7*	
Total, . .	160,000	13,767	1 in 11·6	

* I should account for this very low rate of attendance on the supposition that the members of the various small religious communities included under this head belong mostly to a class which does not make use of primary schools.

School Attendance.

2. Lurgan.

103. (2.) Next I take Lurgan, where my data are far more complete. Mr. Hancock, J.P., who is Chairman of the Town Commissioners, and agent for Lord Lurgan, supplied me with an estimate of the population, and its several denominational elements, which, I have no doubt, from his complete knowledge of all the town affairs is very closely accurate. The population, which in 1861 was 7,772, he now estimates at 10,400, viz. :—

Of the Established Church,	4,400
Roman Catholics,	3,700
Presbyterians,	1,800
Other Denominations,	500
	10,400

104. In this case I am able to give the attendance and the number of children on the roll of each school from my own inquiries, with the exception of the attendance at the Model school, which I take from the school census of June 25th, 1868.

Lurgan.	Estimated population in 1868.	Children in attendance.	Ratio of Children in attendance to population.	Children on School Rolls.	Ratio of Children on School Rolls to population.
Established Church,	4,400	512	1 in 8·6	675	1 in 6·5
Roman Catholics,	3,700	285	1 in 13·0	556	1 in 6·6
Presbyterians,	1,800	223	1 in 8·0	299	1 in 6·0
Other Denominations,	500	35	1 in 14·2	53	1 in 9·4
Total,	10,400	1,055	1 in 9·8	1,583	1 in 6·5

3. Comber, Newtownards, Armagh.

105. (3.) At Comber, where I have no means of knowing how far the population may have increased in late years, the number I found on the school rolls equals 1 in 6·1 of the population in 1861. The attendance was 1 in 8·4.

106. Similarly in Newtownards, the attendance appears to be 1 in 9·6 of the population of 1861; and in Armagh, where, however, a considerable number of country children attend the schools of the Nuns and Christian Brothers, 1 in 8·2.

Protestant children attend far better than Catholic.

107. Noticing more especially the case of Lurgan, which I believe to be particularly accurate, one is struck by the different degrees of regularity displayed by children of different religious persuasions. The last column in the table shows that so far as mere enrolment of names in school books is concerned, the three leading denominations stand very much on an equality. Whereas in point of attendance the Roman Catholics fall far below the Church people and the Presbyterians. In fact, of the 556 Roman Catholic children, little more than half were present; whereas, of the other two denominations, the proportion was fully three-fourths.

108. It will be observed that in Belfast also a similar state of things exists, and that there too, though the attendance of Protestant children is by no means so good as it is in Lurgan, it is still far better than that of the Roman Catholics.

Probable explanation of the fact.

109. If it be true, as I have heard it stated, that the Roman Catholic population of Belfast is increasing more rapidly than the rest, the calculation I have made would be still less favourable to that body. As to the reasons for this phenomenon, I have only to remark that in Lurgan, and I believe also in Belfast, the Roman Catholic body contains a greater proportion of the extremely poor population.

Section III.—Management of Schools.

Rules concerning patrons.

110. I. "The local government of the National schools is vested in the local patrons thereof," say the rules and regulations of the Commissioners. The patronship may be exercised either by an individual or a committee, and in either case the powers may be delegated to a "local manager." When a patron dies, he is succeeded, if lay, by his representative, if clerical, by his successor; when a patron resigns, he nominates his own successor. These arrangements for succession to the patronship are subject to the approval of the Commissioners in each case.

Powers and responsibilities of patrons.

111. The special powers of patrons are thus defined:—"The local patrons (or managers) of schools have the right of appointing the teachers, subject to the approval of the Board as to character and general qualifications. The local patrons (or managers) have also the power of removing the teachers of their own authority." No express stipulations are made entailing expenditure of money or responsibility for the raising of money on the patrons; but in the case of non-vested schools (that is, schools not vested in the Commissioners or in trustees, but the property of private individuals), the buildings have to be kept in repair, and the Commissioners say they must be satisfied "that some local provision will be made in aid of the teacher's salary, in addition to the school fees:" in another place they express themselves "anxious that a further income [*i.e.* beyond the salary] be secured to the teacher, either by local subscription or school fees." The words of this last extract very much weaken the force of the one which precedes it, but in neither passage is any one made responsible for the provision of local aid, though obviously the only person to whom the Commissioners or the teacher could look would be the patron.

Contrast between position of patrons and that of teachers.

112. What strikes one at the first glance in looking over these regulations is the very easy position sketched out for the patron, and the very precarious one for the teacher. The patron may or may not have been at expense in the original establishment of a non-vested school; in a vast number of cases he has merely succeeded to the patronship of a school in a going condition. He is invested with a power of appointment of teachers, subject to approval, and of dismissal of teachers, free from any restriction whatever. In return for the large powers which he is thus enabled to exercise over the servants of the National Board, he undertakes the duty of acting as correspondent for the school with the office in Dublin, and in some way or another, whether at his own expense or at that of himself and his neighbours, or even it may be at the expense of the teacher, he must keep the fabric in sufficient repair. As for the moral obligation to provide a supplement to the teacher's salary, there is nothing to enforce it on him. The teacher, however, holds his office at will only: he may be dismissed at any time with or without cause shown, and with no power of appeal.

MANAGEMENT OF SCHOOLS.

Three forms of patronship.

113. II. The patronship of non-vested schools takes three forms. It is vested either in

(1) An individual minister of religion.
(2) An individual layman.
(3) A school committee.

1. Patron an individual minister of religion.

114. (1.) The most usual form is that of an individual minister of religion, either a Roman Catholic priest, or a Presbyterian; sometimes, but not very frequently, he is a clergyman of the Established Church.

Under this form schools are *quasi* denominational.

115. Under this the most frequent form of management, the schools are always of a *quasi* denominational character. This character is imparted to them in three ways: first, by the presumption of denominationalism which management by a clergyman must produce: secondly, by the situation, in most cases, of the school-building in connexion, or at least in close proximity with a place of worship: thirdly, by the unmixed character of the teaching staff which a clergyman employs.

(*a.*) Both by presumption.

116. The presumption which arises from the religious sympathies and antipathies of a clerical patron, is in the nature of the case unavoidable, and belongs, though it may be in a modified degree, to all kinds of individual patronship. Individual patronship being once conceded, this extent of denominationalism becomes a necessary consequence.

(*b.*) By situation of school near a place of worship.

117. It is greatly intensified by the situation of the school-buildings. If the patron is a Presbyterian, he builds his school, if possible, as an adjunct to his meeting-house, though in accordance with the rules, with a separate entrance. So completely do the sacred and the secular buildings combine and harmonize, that it is sometimes difficult for the observer to determine which part is church, and which school. In not a few cases the school is not so much even as a separate wing of the building, but is held in a sort of vault, underneath the meeting-house. This is the case at the Alfred-street school in Belfast, the Main-street school at Antrim, and the Zion-place school at Newtownards.* The school shares the very same walls with the meeting-house and covers the same area. The chief recommendation for this kind of school-house is its cheapness; the same ground-rent serves for both church and school, and the same roof covers them; but they are not cheerful places to work in, and their situation identifies them in the strongest possible way with one particular form of religious belief.

Schools under the floor of meeting-houses.

Or near Roman Catholic chapels.

118. The Roman Catholic priest keeps his chapel and his school separate, but places them as far as possible in convenient proximity. For this practice he usually has a reason, which rarely exists in the case of Presbyterian ministers. The priest, as a rule, takes far more personal interest in the religious instruction of the children, than does the Presbyterian minister. The latter seldom takes any part personally; he very likely has his Sunday schools to provide for, but the ordinary daily religious teaching of the National school he leaves almost entirely to the teacher. The priest, however, allowing the teacher to do no more than hear the catechism, and considering that all explanation of the doctrines of the Church can only fitly proceed from himself, frequently gathers the children into his chapel—more especially when they are under preparation for confirmation—and there gives them such further instruction as he thinks needful, over and above the mere repetition of question and answer, which is practised in the school-room.

119. In either case, whenever a school is got up by a minister of religion, economy and convenience are nearly sure to coincide with personal inclinations, and fix the building in unmistakable connexion with a place of worship.

Less of this juxtaposition in Belfast itself.

120. In Belfast, where there has often been difficulty in obtaining sites for schools, and where one minister is often patron of more than one school, a great many of the buildings are totally unconnected with houses of worship. There will be one school next the Meeting-house, and the others will be separate buildings, or extemporized rooms, in all parts of the town. Thus the Rev. William Johnston, the greatest pluralist I met with, has one good school within the precincts of his Meeting-house, and seventeen others which he has planted wherever he found opportunity and need. The same is the case, though in smaller numbers, with other Presbyterian clergymen; and hence it arises that in Belfast there is less of outward denominational appearance about the schools than in smaller towns and country places, although the patrons are almost all clergymen.

(*c.*) By the teachers being all appointed from one denomination.

121. Thirdly, I have noticed that under a clerical patron, even when the denominations of the children are various, there is no corresponding commixture of teachers. I am referring solely to the distinction between Protestants and Roman Catholics. Protestant clergymen sometimes appoint teachers who profess a different form of Protestantism from their own; but I never found a case in which a clerical sole patron, if he were a Protestant, had appointed a Roman Catholic teacher, or assistant, or monitor, though I shall shortly mention a case in which a Presbyterian clergyman has *continued* a Roman Catholic teacher; and only once I met with a Protestant teacher (namely a monitress at Aghanlig) appointed by a priest.

Though the children may be thoroughly mixed.

122. I met with several cases in which, though the school was under a single minister of religion, the children were very completely mixed. In Whiteabbey National school, the roll contained fifty-two Roman Catholics out of a total of 391 names, but the teachers (nine in number) were all either of the Established Church or Presbyterian. There had, however, once been a Roman Catholic female assistant, as I was informed. At Kircubbin there were thirty-four Roman Catholics on the roll out of 156; the three teachers and the schoolmistress were all Protestants. At Aldoo, near Carrickfergus, the roll contained 70 Roman Catholics, and sixty-three Protestants, with the teachers being Protestant. At Ballyeasborough, near Kircubbin, there were forty-five Roman Catholics, out of 210 on the rolls, and no Roman Catholic teacher. At Donaghadee (Hunter's-lane) twenty-six Roman Catholics, out of 113, and the staff all Protestant. In the county Armagh, the following schools, under Roman Catholic priests, had no Protestant teachers on the staff:—Ballywilly, with twenty-eight Protestants, and 102 Roman Catholics; Tullesarren, with sixty-four Protestants, and 122 Roman Catholics; Blackwatertown, with thirty-two Protestants, and 192 Roman Catholics. Each of these schools contained several teachers. There are other mixed schools that I saw under clerical patrons, with only a single teacher, which are not cases in point, and others in which, with more teachers than one, the mixture of denominations among the children was slight.

(*d*) By unwillingness of other clergymen to visit such schools.

123. Besides the denominational character which attaches to all schools under the management of individual clergymen, there is a further element of exclusiveness and privacy introduced into them, because one clergyman feels some scruple about visiting another clergyman's school, especially if it adjoins his church. A great deal of the publicity, which in theory belongs to National schools, is thus neutralized, and unless the children attending a school be known to belong to various denominations, a priest never thinks of entering a Presbyterian minister's school, nor does a Protestant visit the Roman Catholic school. The schools are kept nearly as distinct as the congregations with which they are connected.

2. Patron an individual layman. Such schools less denominational.

124. Under the patronship of a layman, a National school assumes a far more independent attitude. No doubt, the form of religious belief professed by the patron gives some colour to the school, but this is of a much fainter hue than when the patron is one who, by his profession, is devoted to the active promotion of one particular

*It is also the case with the Queen-street or Ragged school at Lurgan, but the school is under separate management, and not under the patronship of the minister.

creed. These schools, too, are built not adjoining places of worship, but as separate buildings, conveying outwardly to the eye no particular religious associations. MANAGEMENT OF SCHOOLS.

125. Further than this, some lay patrons have shown themselves to be so superior to all sentiments of exclusiveness or sectarianism, as to appoint teachers of a different persuasion from that which they themselves profess. For instance, Mr. J. B. Black, of Randalstown, is patron of a large and successful school, which I visited, at South Taylorstown. It contained on its rolls the names of 159 children, distributed thus :— South Taylorstown National school.

Established Church,	10
Roman Catholic,	63
Presbyterians,	79
Others,	7
	159

126. It is, in fact, a genuine instance of the united system of education honestly carried out. Mr. Black is a Presbyterian ; the master of the school is a Roman Catholic, and he is assisted by his daughter as female assistant, and his son as monitor. The whole staff, in fact, is Roman Catholic. Mr. Black points proudly to his school as an example of non-sectarian education, and the master is perfectly satisfied with his position, and said that in his experience, Presbyterians would always treat a man well, whatever his religious belief, so long as he did his duty.

127. Again, Glastrey National school, in the county Down, is under a Roman Catholic master. He was originally appointed in 1842, by a Presbyterian layman, to a school then situated close to Glastrey, called Gransha National school. That school was transferred to and amalgamated in the present Glastrey school, and the master was transferred with it. Since 1842 the patronship of the school has passed through several hands, all Presbyterians, and he has still been suffered to remain ; and now—to the credit of that gentleman be it said—the patron is the Rev. J. Rowan, a Presbyterian minister in Kircubbin. This, too, is a mixed school, the proportions being :— Glastrey National school.

Established Church,	8
Roman Catholics,	102
Presbyterians,	55
	165

128. At Blundell's Grange, in the county Armagh, the National school is under the patronship of the Hon. Mrs. Caulfield, who belongs to the Established Church. With a large admixture of Episcopalians in the population of the parish, the majority is Roman Catholic. The Episcopalians attend chiefly at the Church schools, and at the National school the denominations of children on the roll were :— Blundell's Grange National school.

	Boys' School.	Girls' School.	
Established Church,	4	12 = 16	149
Roman Catholics,	54	69 = 123	
Presbyterians,	5	5 = 10	

129. The boys' school is under one master, a Roman Catholic, who has been there seventeen years. The girls' school is managed by his two daughters, also, of course, Roman Catholics.

130. Similar principles of action are carried out at the Whitehouse National school, near Belfast, where the patronship is in lay Episcopalian hands, and where the attendance is a thoroughly mixed one. I extracted from the rolls the following analysis of the religious denominations. The "mill" children are half-timers employed in the factories :— Whitehouse National school.

	Established Church.	Rom. Cath.	Presb.	Others.
(*a*). Boys.—Pay scholars,	28	43	38	1
Mill „	9	13	15	0
(*b*). Girls.—Pay scholars,	15	16	25	0
Mill „	5	5	6	0
(*c*). Infants.—Boys, paying,	24	30	18	0
„ Mill,	6	6	2	0
Girls, paying,	17	38	31	0
„ Mill,	8	10	11	0
	112	161	146	1—420

131. It will be seen that the denominations are very evenly mixed, and equally so whether the children are ordinary scholars or half-timers. The teaching staff consists, for the boys and girls, who are taught together, of the following :—

Master,	Unitarian.
Male Assistant,	Established Church.
Monitor,	Presbyterian.
Mistress,	Presbyterian.
Female Assistant,	Roman Catholic.
Three Monitresses,	Established Church, Roman Catholic, and Presbyterian.

In the infant school :—

Mistress	Presbyterian.
Female Assistant	Roman Catholic.
Two Monitresses	Presbyterian.

132. The patron, then, being of the Established Church, appoints only two teachers of that denomination, three Roman Catholics, five Presbyterians of the General Assembly, and one Unitarian.

133. I dare say there may be other schools within the limits of my district in which a lay patron has acted on these non-sectarian principles, for it was without specially looking for such instances that I came across the four cases I have just cited.

134. Moreover, under lay patronship, a school loses much of the privacy which, as I have said, surrounds so many of those under clerical patrons. It is of the highest importance that the vigorous support of the clergy should be enlisted and retained in the cause of primary education. They form the only class of men whose Less privacy about such schools,

MANAGEMENT OF SCHOOLS.

sphere of duties enables them to exercise a powerful and sustained pressure in favour of regular attendance at school. But this invaluable influence of theirs is weakened, and acts in a one-sided way, if only one clergyman interests himself in a school containing children of various congregations.

and more freedom for clergy to visit them.

135. In very many parishes the Incumbent never sets his foot within the walls of the National school, partly, no doubt, because he objects to the National system *in toto*, but partly also because there is a jealousy between him and the Presbyterian minister, or at least a very intelligible unwillingness to appear to be meddling in his affairs. So if the Church children at the National school attend irregularly, the Incumbent knows nothing about it, and the Presbyterian minister has no *locus standi* with their parents from which to influence them. This is all very much modified when the patron is a layman, and when each clergyman feels that he can visit the school without interfering with his rival's affairs. At Whitehouse school, ministers of all denominations are frequent visitors; and in the same spirit clergymen of the Established Church who refuse to become patrons of National schools, or to have anything to do with non-vested schools, are yet ready to give religious instruction at the model schools, which belong equally to all denominations.

On the whole this form of patronship more National.

136. Schools under individual lay patronship are, therefore, less denominational, both in their associations, their situation, and the composition of their teaching staff, than schools under clergymen, and they are more completely public institutions. Something is lost to them in the way of direct personal superintendence, which is apt to be afforded more regularly and forcibly by a clergyman than by a layman; but against this loss may be set the more general support they gain from clergymen of all religious persuasions.

Position of the teacher under an individual patron.

137. Before passing on to the third form of patronship, that by a committee of several persons, a word must be said on a subject more especially connected with individual patronship, whether lay or clerical, which is one of deep interest to the teachers, and forms a leading topic in the list of grievances which they urge on the attention of the Commission. Patrons have the power to dismiss teachers at discretion, and this is a power liable, in the hands of one man, to abuse; but where the power is vested in a committee of several persons, the chance of arbitrary action is very much smaller.

Powers of patrons not often abused in this respect.

138. I made frequent inquiry on this head from teachers; and though, as I shall have occasion to notice when speaking of them, they are unanimous in deprecating the absoluteness of the authority which a patron can exercise, and regard it as a continual source of uncertainty and weakness to their position; though it is a matter on which many teachers speak with much bitterness, and which has not a little to do with the discontent which undoubtedly pervades that body of public servants, I am bound to say that, on the whole, I believe this authority is not often abused in the district to which my inquiries were confined. When I say, "not often abused," I do not mean to say that the teachers feel generally secure in their posts, or that cases do not occur in which, without assigning a very definite reason, a patron dismisses a teacher in a manner which leads that teacher to think he is aggrieved. In allowing this absolute power to patrons, the Legislature deliberately commits itself to the theory that the cause of education will be best promoted by making it a matter of the first importance to the teacher to satisfy his patron, and that the patron is alone able to judge when it is for the interest of his school that a teacher should be dismissed. Of the effects of this relation which the rules have established between patron and teacher, I will speak when I come to discuss the teachers' case. All I wish to record here is my belief that, generally speaking, the powers which the rules confer on patrons are not strained by them; that possessed of an authority for the exercise of which they are responsible to no superior, they generally act under a sense of responsibility to public opinion and to sentiments of justice and right. In the more Protestant districts the complaints which reached me were all very vague, and were rather symptoms of the general uneasiness of the teachers on the subject than evidence of positive abuses on the part of the patrons. As I went further west, in the county of Armagh, the cases which were mentioned to me grew in consistency and definiteness, and impressed me with the belief that Roman Catholic teachers are, as a body, under a far stricter regime than the Protestants, in their relations with their managers.

(3). Patronship vested in a committee.

139. (3). The third form of school management is by means of a committee of several persons combining for the common object. In the form of a committee, as it were, of consultation, to assist one clergyman who acts as real patron and manager, this method is not uncommonly adopted; but the members are almost invariably of the same religious denomination, and therefore in its effects upon the school the method does not differ from those already noticed. The master of the school feels more security in his office if he knows that his dismissal can be effected only by several wills combined, and not by one only. But as regards the denominational character of the school, it remains unaffected whether the management be by one or by many, so long as it is confined to members of one persuasion.

Committee should be of mixed denominations.

140. Now, the theory of united education, if fully carried out, requires union of denominations throughout the school. Let the children be equally drawn from all denominations, but the teachers all of one creed, and the school is not free from a denominational bias. Even if the teachers be fairly mixed, there may still be some presumption of denominationalism if the sole patron be a minister of religion, or even a layman of decided views on religious matters. The idea of a National system is only completely realised if the management, as well as the teachers and the children, be formed of a thorough mixture of all religious denominations; yet this form of management is, so far as my experience goes, entirely unknown.

Dr. Sullivan's schools, Holywood.

141. One school there is in my district which approaches far more nearly to this ideal than any other; but the very extent to which the plan of a united management has been carried out there only renders more conspicuous the one particular in which it falls short. I refer to Dr. Sullivan's Endowed National schools in Holywood, which are managed by a committee comprising every minister of religion residing in the place except the Roman Catholic priest, and lay members of each Protestant congregation as well. The course of events which has resulted in this exclusion of one element in the community I shall endeavour to detail, and in doing so I shall record no facts concerning which there is any conflict in the evidence laid before me. The whole case appears to me to be sufficiently instructive and suggestive to warrant me in giving the particulars at some length.

Names of my informants on this case.

142. My informants were Thomas Greg, esq., patron of the schools, the Rev. C. J. M'Alester, (non-subscribing Presbyterian minister), the active and liberal-minded honorary secretary to the committee of management, the Rev. James O'Laverty, P.P. of Holywood, and the Rev. Patrick M'Alister, formerly curate of Holywood, now P.P. of Ballycastle.

The old Church View school in Holywood.

143. There was a school connected at an early date with the National Board, known as the Church View school in Holywood. It is believed to have been erected about the year 1819 or 1820, partly by local subscriptions and partly by a grant of money from the Lord Lieutenant out of a fund at his disposal for educational objects. It was erected on a piece of ground granted on lease for the purpose, rent free. At some time previously to August, 1834, it was placed under the National Board. The property was vested in three trustees, two of them Presbyterians connected with the Synod of Ulster (now the General Assembly), the third a non-subscribing Presbyterian. Until a comparatively recent period the Roman Catholic population of Holywood

was small; but such as it was, it is believed that the children of that community were in the habit of attending this school. It appears from an extract supplied to me by the Rev. C. J. M'Alester, which he takes from the Minutes of Evidence given before the Parliamentary Committee of 1837, that the school contained on its rolls in 1824 eighty-four children, of whom twelve were Roman Catholics, and in 1836, 114 children, of whom ten were Roman Catholics. It is probable that these numbers fairly represented the Roman Catholic population at the time, and as there was no resident Roman Catholic clergyman in the place it is not surprising that the education of the few Roman Catholic children was carried on at a school under exclusively Presbyterian management. For Roman Catholic ecclesiastical purposes Holywood was, until recent years, under the care of the parish priest of Ballymacarrett, which is practically the part of Belfast lying within the county Down, and distant from Holywood about five English miles.

MANAGEMENT OF SCHOOLS.

Dr. Sullivan's schools, Holywood—*con.*

Roman Catholic population small at that time.

144. Within the last dozen years or thereabouts the population of Holywood has very greatly increased. It now forms a suburb of Belfast, in which a very large number of gentlemen connected with Belfast by business reside with their families. The increase has been mainly brought about by a railway, which has brought it within ten or fifteen minutes' journey of Belfast. The construction of this railway and the rapid increase of business in Holywood itself have produced a great accession to the numbers of the Roman Catholic inhabitants, and in January, 1862, a resident curate was appointed to take charge of them. Still more recently Holywood has been made a distinct parish, with a resident parish priest.

Large increase in number during recent years.

145. The Church View school, after having been altered and improved 12 or 15 years ago, was found to afford inadequate accommodation to the increasing numbers who attended, and in or about the year 1859 a plan was set on foot for enlarging it. The intention was accidentally made known to the late Dr. Robert Sullivan, a native of Holywood, and professor in the training school of the National Board at Dublin, well known as the compiler of some of the school-books sanctioned and supplied by the Board. Dr. Sullivan having spent his life in the service of the Board, was a very warm adherent of the mixed system of education, and had in various ways displayed his devotion to the extension of National education in Ireland. Among other things, he had established an exhibition of £30 a year at Queen's College, Belfast, restricted to candidates who had acted as teachers or assistants for at least two years in National schools to the satisfaction of the Board. Dr. Sullivan at this time intended to bequeath the sum of £2,000 for the purpose of building and endowing a National school in Holywood; but on hearing of the immediate necessity that existed for enlarging the old school-house, he determined to anticipate the period of his intended bequest by giving the sum at once in his lifetime. He therefore wrote a letter, dated 24th September, 1859, to Mr. Greg, who was then resident in Holywood, requesting him to undertake the carrying out of his intentions. He wished £1,000 to be expended on the buildings, and the other £1,000 to be invested for the benefit of the school in any way Mr. Greg might consider the most desirable. He then says:—

Circumstances of Dr. Sullivan's first endowment.

"The only wishes or suggestions which I have to make on the subject are:—

"1. The school is to be called the Holywood National school.

"2. It is, when completed, to be put under the Board of National Education, in order that it may have the benefit of the inspection of their officers, grants in aid of the salaries of the teachers, and books and school requisites for the pupils at reduced rates.

"3. And should the National system of education be broken up or discontinued—which, for the sake of Ireland, I hope may never be the case—the principles of that system are, nevertheless, to be always acted upon in this school. These principles are easily understood; in fact they were explained in two words by the Archbishop of Dublin in his speech on the subject in the House of Lords, so early as the year 1833—namely, that the foundation of the National system of education in Ireland is this—'That with regard to religious instruction there is to be no restriction—no compulsion.'

"That a system of education founded upon such a principle as this should have met with so much opposition has always been to me a matter of wonder and regret, particularly as I knew, by the experience of every day for the last eight-and-twenty years, that it was producing the most beneficial and the most important results in every part of Ireland. In fact, I am firmly convinced that the general and gratifying improvement which has taken place in this country of late years is, n no small measure, due to the operation and effects of the National system of education; and, should the British House of Commons ever permit it to be broken up, and a separate and sectarian system of education to be substituted in its stead, I venture to predict that the consequences to this country will be most disastrous. In fact, to do so 'would be,' in the words of an eminent prelate, 'to divide Ireland into two hostile camps, with clerical sentinels pacing up and down to prevent the people from holding any friendly communications.'"

146. Mr. Greg, charged with the execution of this responsible task, proceeded to gather together a committee to act with him and assist him in the matter. This committee was, in fact, the committee of the old school, increased in number and strength, and the declared object was that it should consist of a clergyman and a layman of each religious denomination which was represented by a resident minister in Holywood.

Constitution of the original committee to contain all resident clergymen.

147. The members of the committee thus originally constituted were—

Members of the original committee.

	Clergymen.	Laymen.
Established Church,	Rev. L. S. Kennedy (Vicar),	Mr. M. M'Cammon.
Presbyterian (General Assembly),	Rev. H. Henderson,	Mr. John Hanson.
Do. do.	Rev. James Denham,	Mr. William Browne.
Do. (Non-subscribing),	Rev. C. J. M'Alester,	Mr. William Robertson.

148. The teaching staff appointed was as follows:—

Denominations of teachers.

Male Assistant,	Roman Catholic.
Monitor,	Presbyterian (Non-subscribing).
Female School.—Mistress,	Established Church.
(1.) Monitress,	Presbyterian (General Assembly).
(2.) Monitress,	Presbyterian (Non-subscribing).
Infant School.—Mistress,	Presbyterian (Non-subscribing).
(1.) Monitress,	Roman Catholic.
(2.) Monitress,	Presbyterian (Non-subscribing).

149. The denominations of the children entered on the rolls during the first three or four months after the opening of the new schools, were (to quote a report of the Committee) 253 Protestants and 63 Roman Catholics, one-fifth of the whole number being members of the Roman Catholic Church.

Denominations of original scholars.

150. The mode of procedure in the constitution of the Committee is thus described by the present Committee in a report read at a public meeting in Holywood, on Tuesday, November 24, 1868. An account of that meeting appears in the *Northern Whig* of November 26th, and from that paper I extract the following quotations from the report. It should be mentioned that the object of the meeting was to take into consideration further large benefactions accruing to the school under Dr. Sullivan's will, which will settle on the schools a valuable permanent endowment. The passages which bear particularly on the matter in hand are these:—

Description given in recent report of the committee.

"About nine years ago, Dr. Sullivan conveyed to Thomas Greg, esq., J.P., the sum of £2,000 for the establishment of a National school at Holywood. The munificent donation was intrusted to the sole management of Mr. Greg, . . . and

MANAGEMENT OF SCHOOLS.

Dr. Sullivan's schools, Holywood—*con.*

the only condition made by Dr. Sullivan was, that the £2,000 should be employed for the promotion of non-sectarian education in this town. . . . There having been in existence for a lengthened period a National school conducted under non-sectarian principles and management, Mr. Greg invited the Committee of that school to consult with him as to the establishment of the new schools. It was then unanimously agreed that the Committee of Management of Sullivan's school should be formed on the model of the Old Church View School; and it was arranged that all the resident clergymen of the various denominations, together with a layman from each of their congregations should form the Committee. As there were then no Methodist or Roman Catholic clergymen resident in Holywood, no clergymen of these Churches were named on the Committee."

At the formation of the committee no resident priest in Holywood.

151. I must ask particular attention to the last sentence in this extract. *At the time when the Committee was being formed* there was no Roman Catholic clergyman resident in Holywood; there was a Roman Catholic chapel, at which the Rev. Dr. Killen, who resided at Ballymacarrett, used to attend at stated times, and he had the supervision of the Roman Catholics of Holywood as part of his ecclesiastical district. But a resident priest there was not. Moreover, with a literal adhesion to the terms on which the Committee was being formed, the exclusion of the priest on the score of non-residence was held to entail the exclusion also of any lay member of his congregation—a course which, I confess, appears to me to be prescribed by an inversion of the argument *a fortiori*.

A priest became resident before the schools were opened, but he and his successors not admitted to the committee.

152. However, the ground for the disqualification of the priest was very speedily removed. Dr. Sullivan's first announcement of his gift was made in September, 1859; the preliminary arrangements, formation of the Committee, choice of site, and building of the schools, occupied the time until the 20th of April, 1862, on which day the schools were opened. In January, 1862, three months prior to the opening of the schools, a Roman Catholic curate, the Rev. Patrick M'Alister, became resident at Holywood; and I am assured that ever since that time there has been a resident Roman Catholic clergyman in the place. One would have thought that the scheme which the Committee framed for themselves, namely, that their Board should contain "all" the resident clergymen of the various denominations, would by a self-acting process have admitted the resident Roman Catholic minister *ipso facto*, so soon as he complied with the condition. But, on the contrary, to this day no offer has ever been made to any Roman Catholic clergyman of a seat at the Board, though there have been several different priests in charge since the beginning of 1862.

Reason assigned by the committee for not admitting the priest.

153. This noticeable departure from the expressed principles of non-sectarianism on which the Committee took their stand at the first, is thus adverted to in the report from which I have already quoted. The Committee say :—

"In their management of the schools there has been no sectarian or political bias; there has not been on the part of any member of the Committee the slightest attempt made to promote sectarian pre-eminence, nor has there been since the opening of the schools, on the part of parents or child, or anyone, a single charge of interference with the religious views of the pupils.

"In consequence of a Wesleyan minister having been located at Holywood, the Committee are glad to say that they have added to their number the Rev. Henry Price, and a lay member of his Church, while they regret that the avowed hostility to the National system, of the Rev. James O'Laverty, has deprived them of his services, and those of the Roman Catholic laity, in the management of the schools."

Offer recently made to two Roman Catholic laymen, and declined.

154. In explanation of the reference made to the Roman Catholic laity it should be added that the Committee about a year ago applied to two Roman Catholic laymen residing in the town, asking them to accept places at the Board. These two gentlemen communicated with Father O'Laverty, and the issue was that they both declined to serve.

Ground assigned for excluding the priest now changed.

155. It will be observed that the Committee have now relinquished the original ground on which Dr. Killen was disqualified, for in fact that ground has long since been cut away. They still recognise a presumptive title in all resident ministers of religion by the terms in which they allude to the election of the Methodist minister. But in Father O'Laverty's case the title is set aside on account of a presumed, and no doubt sufficiently ascertained, difference of sentiment and opinion on the subject of National education.

But all resident priests have been alike excluded.

156. Although the Committee confine themselves to assigning a special reason for disqualification in Father O'Laverty's case, it will be recollected that Father O'Laverty's predecessors were treated in exactly the same way; the Committee have, in fact, followed a consistent course in excluding all Roman Catholic priests from their councils. Meanwhile the Roman Catholic contingent in the schools has gradually increased, and on the 12th of November, 1868, it amounted, according to my own analysis of the school-books, to 106 out of 409 names on the rolls.

Difficulty in which the committee is now placed.

157. It is easy to conceive the difficulty in which the Committee finds itself placed if it is now really desirous of securing complete unity of action. When the schools were first opened there was a golden opportunity lost, which it has become year by year more difficult to retrieve. The Committee now justify themselves by reference to the priest's hostility to the National system, but it cannot be forgotten that the experience each priest at Holywood has gained of the administration of the National system has not been such as was best calculated to make him a friend of the system.

The committee not unanimous in the exclusion.

158. I have reason to believe that a minority of the Committee has throughout been favourable to a recognition of the claims of the Romam Catholic portion of the population.

Bitter spirit reigning in Holywood.

159. As may well be supposed, the history of Dr. Sullivan's schools carries with it a plentiful crop of angry recriminations, and the bitterness of sectarianism is abroad and over all in Holywood. Educationally, what has taken place is now producing its natural fruit. Father O'Laverty's words to me are :—"We will open the 1st of January, 1869, National schools under my patronage, and I will use my best endeavours to remove every Catholic child from Sullivan's schools."

Probability that Dr. Sullivan's schools will henceforth be attended by Protestants only.

160. That this will be done, and that Dr. Sullivan's non-sectarian schools will soon be attended by Protestants alone, the present policy of the National Board in multiplying schools of a denominational character forbids me to doubt. In default of representation on the Committee of Dr. Sullivan's schools the Roman Catholics of Holywood have, as it seems to me, a claim for a separate school, which the National Board cannot refuse, and deeply to be deplored as I believe the necessity to be, mere justice demands that the balance of the Board's favour among the clergy of the town should be redressed. Far better would it be for the credit and harmony of Holywood if, even now, a complete unity of interests and of action could be established among all denominations, and the splendid foundation of Dr. Sullivan made a boon to all classes alike; but except through the action of external authority, this cannot now be effected. The day of spontaneous reconciliation seems to be hopelessly past.

Incidental injury to the working of the schools through exclusion of the priest.

161. The course of action which I have detailed, has not been without its incidental evils, apart from the blow it is inflicting on the system of united education. In the Report of the Committee, from which I have already quoted, notice is taken of the unsatisfactory condition of the Roman Catholic portion of the attendance at Dr. Sullivan's schools. Taking the names which have appeared on the rolls during the current quarter

(which would include those which were struck off in the course of the quarter), the committee give statistics which may be summarized thus :— MANAGEMENT OF SCHOOLS.

	Total Number.	Roman Catholics.
1. Male School:—		
In 5th and 4th classes,	26	3
3rd class,	46	4
2nd class,	80	23
1st class,	24	12
2. Female School:—		
In 4th class,	25	3
3rd class,	13	–
2nd class,	58	22
1st class,	17	6
3. Infant School:—		
In 2nd class,	15	1
1st class,	124	33

Dr. Sullivan's schools, Holywood—*con.*

That is to say, in the upper half of the school throughout, divided by classes, there are 11 Roman Catholics out of a total of 105, or less than 9 per cent. In the lower half there are 96 out of a total of 303, or nearly 35 per cent. My own statistics for November 12th give very similar results. On this comparison the committee remark :—

"The greater number of Roman Catholics in the lower classes, as compared with the other denominations, is owing to the extreme irregularity of their attendance, and the poverty of their parents prevents the greater number from keeping their children sufficiently long at school to attain the position of fourth class."

162. Father O'Laverty's explanation of the bad attendance is, that it is due to the fact that he himself does not visit the schools to look after the children, and so the school, and especially his interest in it, suffers for want of his co-operation.

163. At Holywood, then, the united form of government exists with this notable exception, that the Roman Catholics are disfranchised. To the benefits of the school teaching, they are readily and gladly admitted; members of their Church are mixed with Protestants in the teaching staff; and all, in fact, is done to make these schools perfect representations of the united system of education, except in this cardinal point, that as regards the Roman Catholics, the schools are governed for them, and not by them, or with their co-operation. If this one matter could be set right, Dr. Sullivan's schools would present a spectacle of completeness, such as not even the plan of the model schools can display. As it is, there is every reason to believe that its glory as a mixed school will soon pass away. Completeness of Dr. Sullivan's schools with one great exception.

164. The moral of the whole case is only too obvious. Such a combination as rules the endowment in Holywood, as it is incompatible with the spirit of united education, should be rendered by authority impossible. Moral of the whole case.

165. With respect to patrons of National schools in general, I have one remaining point to notice. The rules of the Board make reference to the raising of local aid in augmentation of the salaries of teachers, and over and above the fees paid by the children. The Commissioners require to be "satisfied," that something of this kind will be forthcoming. I received returns from nearly all the schools in my district, in which, among other things, the teachers supplied me with the particulars of the several sources of income on which the schools subsist. Local aid in addition to teacher's salary very rarely raised.

166. Out of all the Belfast National schools nine only in answer to my inquiry return anything as received from local contributions; I omit factory schools, which are in part supported by a payment from a mill in return for the teaching of half-time children, and also the schools in Pilot-street, which are aided by the Seamen's Friend Society. The returns from which I quote embrace sixty-four schools—schools containing two or three departments being counted as one. It would seem, therefore, that in Belfast not more than fourteen or fifteen per cent. of the patrons of National schools obtain any local aid for the teachers' remuneration. The schools which had been so aided were all under Protestant management. The gross amount raised was £131 13*s.* 8½*d.*, in1867. In Belfast.

167. In the Antrim portion of my district (excluding Belfast), I received returns from all but six schools; out of 117 National schools, eleven had received local aid in 1867, and the gross amount contributed was £48 7*s.* 10*d.*, all in Protestant schools. In county Antrim.

168. In the county Down my returns are defective by three schools, and out of sixty-one that made returns, eighteen had received local aid in 1867 to the aggregate amount of £161 9*s.*; these schools were all under Protestant management, and include some subsidized by Lord Dufferin. In county Down.

169. In the county Armagh my returns cover all but five National schools, and out of seventy-four schools which sent returns, thirty-eight had received local aid in 1867, amounting altogether to £374 3*s.* 9*d.*, of which £199 was contributed by schools under Episcopalian management (including several subsidized by the Duke of Manchester), £114 10*s.* 6*d.* by Presbyterians, £50 by other Dissenters, and £16 13*s.* 3*d.* by Roman Catholics. In county Armagh.

170. In the county Armagh, then, where the people are often very poor and the receipts from school fees very low, more than half the patrons comply with this requisition of the Commissioners of National Education. In Belfast and the more well-to-do counties of Antrim and Down, only fifteen or sixteen per cent. of them do so. Contrast.

171. The management of Church schools does not, I think, call for any special notice. They are usually under the sole control of the incumbent of the parish, who acts on his own responsibility in all that concerns the school, and very frequently allows his teacher to act as parish clerk as well. He is very much more active in obtaining and contributing aid for the support of the teacher than are patrons of National schools, and this for the reason that the teacher is almost solely dependent upon this source of income. In an Appendix, at p. 242, I give a list of twenty-four Church schools, showing the manner in which they are maintained. Church schools.

SECTION IV.—TEACHERS.

172. The teachers of primary schools belong to two classes: there are teachers religious and teachers secular. The former class consists of nuns superintending convent schools in connexion with the National Board, or Christian Brothers in charge of independent schools of their own. The latter class comprises the vast body of the teachers, who again are either public servants in the pay of the National Board, or persons employed by other societies or by private persons independently of the State. Two classes of teachers.

173. I will reserve what I may have to say about teachers belonging to religious communities for the special notices I propose to present of the convent and the Christian Brothers' schools. Under the present head I propose to deal solely with secular teachers, and in particular, teachers under the National Board.

174. I. *The Teacher's position.*—We have seen that the position of a National teacher is one of absolute dependence upon the will of his patron. He may be dismissed at any time with or without reason, and has no power of appeal against what he may deem harsh treatment. I have said of the managers generally that having Their position under their managers.

TEACHERS.

such powers committed to them, they do not appear to me to be in the habit of straining them; but none the less it is felt as a deep grievance by the teachers that they are never safe against the effects of a possible whim or quarrel. The almost invariable answer I received from the teachers when I questioned them on this subject was "I have no complaint to make about my manager: he always treats me in a considerate manner; but other teachers may not be so fortunate, and in any case I consider that no body of public servants should be liable to an exercise of arbitrary and irresponsible power on the part of any man." This was the burden of almost all the remarks I heard made by the teachers. Their discontent is, in fact, exactly that of men living under a kindly despotism. There may be every reason to hope and believe that if a man lives a quiet, blameless and industrious life his liberty will not be interfered with, but no nation rests satisfied with no better assurance than that: the knowledge that in case it should be thought convenient to put a man out of the way he would be powerless to remonstrate or resist foments discontent and uneasiness, however strong the presumption may be that the case will never arise. So it is with the teachers. The managers may be the most just and humane men in the world, but no amount of uprightness in their dealings can compensate the teachers for the loss of their sense of security and independence. A few specific cases of arbitrary dismissal were named to me, but in no case did it appear that the manager had done any more than what the rules empower him to do. He had simply given a teacher notice that he was to leave, and the rules of the Commissioners clearly intend that he should be able to do this without the obligation to give any account of his reasons.

Sense of insecurity in the minds of the teachers.

Manager's power may be exercised in many ways short of actual dismissal.

175. This power of the manager may, however, be employed in many ways short of actual dismissal. It is a lever by which the teacher may be swayed and checked in all the details of his business. For instance, in the matter of the exaction of school fees there are cases in which the teacher is unable to consult his own advantage by securing payment from all who can afford to pay because his patron may interfere on the parents' behalf. The teacher of one school under Roman Catholic patronship gave me a slip of paper which he had received from one of the parents with whom he had to deal, which contained a brief intimation to him that he had heard the priest say that he was "to teach these childern" (*sic*), the meaning being that he was to ask no fees. This case was but one out of many which had depressed his receipts to a very low point, and at the time of my visit he had ceased for a time to exact any fees, because he was aware of complaints which had been made to the patron about his attempts to exact payment. His own belief was that his school was being seriously injured by irregularity of attendance consequent on his inability to ask for his fees, at the same time that the parents were not paying towards his support as they could afford to do. No compensation in the form of local contribution was made to this teacher; and the effect first of the neglect by the patron to obtain such aid, and secondly of his practical prohibition of school fees is that the teacher is reduced to depend for his livelihood solely on the salary granted by the National Board; and that is a state of things which the rules do not contemplate.

Control of managers over exaction of school fees.

176. If the patron will support the teacher in exacting his dues a great deal may be done for the benefit both of the school and the teacher. At Bangor National school the patron, a Presbyterian minister, attends every Monday morning at the school to see to the due payment of the fees: and the Rev. Canon Coyne, P.P. of Moy, told me how he had on one occasion stood at the altar with a list of defaulters in his hand and warned his congregation that if the teacher's dues were not paid forthwith he would take measures to *make* them pay; ever since which announcement none of his teachers (he is patron of several schools) had experienced any difficulty about fees. When this course of action is reversed, and the patron tries to secure free instruction for his people while the teacher tries to secure as large a return as he can in the way of fees, a serious injury is done, because the people then learn that in this matter the patron and the teacher are not at one; they know well which is the stronger of the two; they think they have the patron on their side in any dispute with the teacher, and the teacher besides losing in pocket loses also the hold which he ought to have on the feelings and estimation of the people.

General effect of teacher's position.

177. So far, then, as my inquiries enable me to form a judgment, I believe that the principal effect of the precarious tenure of National teachers is to weaken unduly their position in any case of difficulty or difference with children or parents, and to promote a spirit of discontent and a sense of insecurity which are of even more injurious consequence, in that they tend to sour the character and depress the spirits of men who need all their geniality and elasticity for the daily work they have to perform.

Rule of National Board that they will not correspond with teachers.

178. What renders the position of the teacher still more dependent is the rule established by the Commissioners that they will not correspond with teachers, but only recognise communications coming through the medium of the managers. If a teacher has a complaint or a statement of any kind to make to his employers, he can only do so if his patron concurs in it: clearly, therefore, a complaint about the patron's conduct is beyond the bounds of possibility. A great deal of the sting of any wrongful treatment is taken out if the victim has a chance of saying all he has to say; and teachers would feel the hardships to which they are liable far less acutely if in case, for instance, of sudden dismissal they could at least tell their tale of trouble to the Commissioners of National Education. As it is, not only have they to put up with dismissal, with the knowledge that their patron is acting within the limits of his authority, and that they have no redress, but they have also to bear the imputation of incompetency, vague and unintended though it may be, which accompanies an unexplained dismissal, without the chance of saying a word to clear themselves. In smaller matters the teachers frequently complain of the difficulty they experience in getting their managers to write to the Dublin office when occasion arises. Very probably the managers save the Dublin office from a great deal of useless correspondence; but there would seem to be no valid reason why an occasional communication—say once a quarter—should not be allowed to be made by the head teacher of a school direct to the office.

Complaints made concerning the routine of the Dublin office.

179. One ground assigned for the unwillingness of managers to write to the Board is the extreme dilatoriness which is charged upon the officials in correspondence. I heard very frequent complaints of the manner in which the routine business of the office is carried on. For instance, a teacher's salary is frequently allowed to be a month or six weeks overdue before it is paid: a receipt, I am told, comes punctually at the end of the quarter for signature, but the remittance follows often at a long interval. One master told me how his sister, when acting as monitress under him, never received her remittance at all. It was for a very small amount, only 13*s.* 4*d.* The receipt came, and was returned duly signed, but no remittance followed. Application had been made by the manager for it, but in vain, and it was now considered a bad debt. Another teacher informed me that the reason his manager assigned for not writing to the Board whenever he wanted him to do so was that he was "tired of writing letters to which he got no replies."

Complaints of delays in appointment of teachers.

180. Many stories are told too of appointments long delayed, and salary lost thereby; in one instance a girl had taught for a whole year as successor to a monitress who had been duly salaried; no diminution had occurred in the school attendance (on the contrary it had risen on the quarterly average for the year, from 58·6 to 63·4), and the Inspector promised her a recommendation for appointment: on the faith of this she taught for a year, received no intimation of appointment, and then left, having received no remuneration

whatever for her labours. Not a few of the best masters hold appointments also in connexion with the Science and Art Department, and the comparison they institute between the dealings of that body and those of their employers in Dublin are not to the advantage of the latter. They all speak highly of the promptitude and consideration with which they are treated by the authorities at South Kensington, with whom, of course, they hold direct communication.

In some matters a direct communication with teachers might be valuable.

181. On one subject in particular it was represented to me by one of the most thoughtful of the teachers I met that a word from a teacher would be valuable to the Commissioners of National Education; that is, in matters relating to the establishment of new schools. In many places National schools are unquestionably too numerous, and if before sanctioning a new school in the neighbourhood of one or more already existing, the Board would consult the teachers of those schools which would be affected thereby, their remonstrances in self-defence might possibly save the Board from many a false step.

182. The tenure of their office by teachers of schools independent of the National Board calls for no special remark.

Qualifications of teachers.

183. II. *The Qualifications of Teachers.*—The teachers of primary schools are of very unequal degrees of competency. The principal of a large and flourishing National school and the teacher of a small semi-animate school under the Church Education Society occupy the opposite poles between which are comprehended the great body of primary teachers in Ireland. And as the teachers are, so are their schools. I had no opportunities of ascertaining directly the literary acquirements of teachers, but in conversation and in observation of their school management one forms a tolerably correct estimate of their value for the particular purpose for which they are employed.

Those of National teachers as high as can be expected for the emoluments offered.

184. (1.) The National teachers generally struck me as being quite as intelligent a body as we have any right to expect, considering the emoluments offered to them. I frequently heard the complaint made that the teachers are half educated or less than half educated men, and that their little knowledge, besides hindering the progress of popular education, leads them to take an exaggerated view of their own importance and deserts; consequently that a good deal of their dissatisfaction with their position and remuneration is in excess of what their real merits will justify. I entirely concur in the view that one of the first steps requisite for the improvement of education in Ireland is to raise the average standard of competency in the teachers, but none the less does it appear to me that the average standard already attained is quite as high as it is possible to reach without an advance in the attractions offered. It is vain to look for the services of an able man on 10*s.* or 15*s.* a week. In the neighbourhood of a great mercantile town like Belfast especially, there are endless opportunities for an enterprising man to earn a better living than that which any but a few of the best schools, combined with a high class salary, can hold out to him. A copying clerk or accountant can easily make £100 a year in a house of business, and unless a teacher is particularly fortunate he will never get so much in a school. Many of the more active teachers are continually being drawn off from the service of the National Board by the superior advantages of commercial life. Hence a large number of them are merely the disappointed residuum which has failed to provide for itself in some other line of life. This state of things explains a great deal of the discontent and also the inferior competency complained of. Still as the whole matter is one which depends upon market value, the National Board secures a fair return for its outlay. I believe it secures something more than a fair return, for the official position in connexion with the State, the easy hours of work, which leave the teacher free after three o'clock, and the sense of authority which a teacher exercises in school, are not without their attractions, and combine to retain many who might otherwise be tempted by the greater emoluments to be obtained in less dignified, more laborious, and more subordinate posts in other lines of life. Certainly I met many National teachers whose capabilities appeared to me to be very cheaply valued, if measured by the rate of the remuneration they receive.

Teachers vary greatly in competency.

185. But, as I have said, their merits vary very greatly. In National schools an index of this variation is afforded by the system of classification adopted by the Board. All teachers are either probationers or classed teachers, the latter having a rank assigned them according to their merits as ascertained by examination of themselves and of their schools. They are arranged in three classes, which are again subdivided into divisions, the first class into three, each of the others into two. There are therefore seven different grades of classed teachers.

The classification by the Board is generally a fair index.

186. I have not been able to trace the accuracy of so nice a discrimination as this in what I have seen of the quality of the work done by the teachers, though unquestionably the classification of the teacher is in general a very fair index of the character of his school. In particular the subdivisions in the first class seemed to me to have little or no counterpart in the condition of the schools under first class teachers of different standing. Some of the best work I saw was in schools under teachers of the third division of first class, and of the whole number of schools I examined under first class teachers, the two with which I had most fault to find were under female teachers of the first and second division of the class respectively. Passing to the other extreme, I never found a highly developed school under a third class teacher, and such schools are as a rule feeble and unsatisfactory; in many instances natural promptitude and a habit of order go far to redeem a weak school from unmixed condemnation, and I could name several schools under third class teachers which on this account are in a far more healthy state than others which are under less methodical, even if more gifted, principals. But it may be safely asserted that, with rare exceptions, third class teachers in the position of principals are failures.

Classification of teachers of seventy National schools examined.

187. The schools I examined are nearly equally apportioned among teachers of each class. My notes on this point are not quite perfect, but with respect to seventy different departments which I examined I find the following distribution:—

(1.)	20	are under	first class teachers.
(2.)	21	„	second „
(3.)	24	„	third „
	5	„	probationers.

On an estimate not very precise, but generally true, I should characterize 13 out of the 20 under first class teachers as good schools, and 7 as either inferior or bad. Of the 21 under second class teachers, 10 good and 11 inferior or bad; of the 29 under third class teachers and probationers, 8 or 9 satisfactory (though not of a high character) and the rest, 20 or 21 in number, very poor.

Third class teachers should not be allowed as principals.

188. A rule which would render the appointment of a third class teacher to a post as principal of a school impossible would be of most salutary effect in raising the character of National schools; but this can only be made possible by means of important modifications in the terms of employment offered by the Board. A large number of small country schools offer little or no inducement beyond the class salary, and unless compensation be offered in another form for the loss of fees, none but third class teachers will accept such posts.

TEACHERS.

Teachers of Church schools wanting in method and precision.

189. What, however, is quite unnecessary, but not unusual, is that third class teachers are found in charge of large and important town schools, which could command the services of better men.

190. (2). Of the teachers of Church schools, or other schools of an independent character, I have only to say that as a body they lack a certain precision and business-like demeanour which is usually observable in National teachers. There is a touch of officialism about the National teacher which, although it may tend to a perfunctory mode of working, still carries with it something of authority and method, and asserts itself effectively over the minds of the scholars. There is none of this in the teacher of the Church school. He manages his school very much in his own way, according to his lights, with a more paternal and less machine-like exercise of authority than the National teacher. His prevailing faults appeared to me to be want of life and spirit, and disregard of method. On entering unexpectedly any National school one is sure to find everything *en règle* and the work going steadily on; at a Church school there is nearly an equal presumption in favour of something being out of gear at the moment. More than once I found children assembled, but no teacher with them. More than once, if the master was present, he had his hat on, as if he were merely *in transitu*. At one school he was sitting with his hat on at the open window, enjoying the fresh air of a fine afternoon, while the mistress, his wife, was in the garden with two or three of the children; this was at about 2.15 P.M. There is none of this laxity about National teachers, who are liable at any moment to an Inspector's visit.

191. So far as one can judge of their intelligence in the course of a visit of inspection, the teachers of non-National schools are usually of the calibre of third class National teachers, but without the same notion of method and management. Some of them, however, belong clearly to an order which has no representative at all among the servants of the National Board—teachers who know nothing of teaching, and who have yet to learn the rudiments of knowledge themselves. In the returns which I collected from all schools in my district I had an opportunity of judging of their spelling. One would think that on such an occasion a teacher would be careful to do his best, but from one school I am told that it is in connexion with no "Churh," that "Hand-lom" weaving affects the school attendance, and that the money for support of the school is "raised by the local comittee;" the teacher signs himself a "Presbyterain" (*sic*). Others were guilty of similar eccentricities, but the most remarkable document I received was the following. I omit names, and certain paragraphs which need not be published. The figures correspond with the questions reprinted in the Appendix I. I adhere strictly to the letter and punctuation of the original.

Specimens of their orthography.

1. I. consider the persons in this locality avails themselves of the opportunity as much as possible of sending their children to the school.
2. There are no industrial or manufactries nearer to my school than ——— that is eight miles distant from my school so that it can have no interference with the children of this locality
3. I. have no half-timers as there is no Factorys in this direction
4. My terms are one penny per week for spelling reading writing and the greater part *gratutious* in consequence of their parent not having means. I. am paid by ——— not having any connection with any Board or society nor receiving on penny by any other person.
5. As regards the system of education of the National board as I have never stood in a N. S. I. cannot interfere so far as spend any opinion without error.
7. Not including private tuititions and night schools throughout the year, I consider I make about £6 having no person but myself to provide for I can by it I should feel thankful if you would be so kind as let me know if you could be so kind as to give me some little encouragement, and in duty bound I will feel grateful

All denominations attends the school

Your most obedient servant ——— teacher.

I regret that I failed to find this school when I was in the neighbourhood of it.

Teacher's emoluments.

192. III. *The Teacher's Emoluments.*—These are derived, in the case of National teachers, from three sources, the salary paid by the National Board, the fees paid by the pupils, and local aid provided in augmentation of his income from salary and fees.

Board salaries.

193. (1.) Only one of these sources is open to all teachers, that is what he derives from the Board, whereas fees and local aid which in some schools are considerable, are in many altogether non-existent. In ordinary National schools the salaries for male principal teachers lie between £15 and £52 per annum; for female principal teachers between £14 and £42. Assistant teachers receive, if male, from £15 to £21, if female from £14 to £20. Monitors receive from £2 to £10 a year. The salaries are regulated by the classification, and are liable to reduction if the average attendance of children falls below certain limits. Thirteen premiums, from £1 to £4 each, for order and neatness, are distributed annually in each Inspector's district; and further gratuities ranging from £1 to £5 each, may be obtained for teaching singing, drawing, and navigation, or for instructing monitors, and preparing young persons for the office of teacher; £5 a year more for every twenty-five pupils may be earned by a night school. Lastly "good service" salaries are granted to a certain number of teachers, to the extent of £3 to £13 per annum, for males, and £2 to £11 for females; this is in addition to the regular class salary. There is no system of retiring pensions, but the Board are empowered to grant gratuities "of reasonable amount" to deserving teachers, on retirement through age or infirmity.

Highest attainable remuneration.

194. Thus the best teachers may by aid of good service salary receive, if males, £65 a year, if females, £53; and this may be further increased to a small extent by extras and by a night school. Teachers who attain to this height always hold schools which further produce a considerable remuneration in the way of fees, and this class may be said to be in general able to maintain itself in modest comfort, on perhaps as much as £2 a week in all.

Usual amount wholly inadequate if not supplemented from other sources.

195. But the great mass of the teachers are not in the first class, and not in receipt of supplemental salaries. In the second class the salary for a male teacher is £28 or £32; for a female, £24 or £26; in the third class £18 or £24 and £16 or £20 respectively. It is equivalent to from 7*s.* to 12*s.* 6*d.* a week for a male, and from 6*s.* to 10*s.* a week for a female. This scale of remuneration is only intelligible, especially in the case of men, on the understanding that it forms but one element in the aggregate income of the teacher; but unfortunately in proportion as the salary is lower so do the receipts from other sources become more insignificant, until in some places teachers are found who are solely dependent upon this small pittance, which hardly puts them on a level with a day labourer, and falls very far short of the earnings of a mechanic in Belfast. Indeed a male teacher living on his class salary alone, or with an inappreciable income from fees, must be a miserable man. A youth living with his parents may find his earnings sufficient to make him comfortable, and to a woman who either lives with her parents, or has a husband, who earns a livelihood as well, the position of a teacher offers great attractions. But it is very different with a man who has to keep a home of his own, or looks forward to doing so.

Instances: Corcrain National school.

196. I will give a few of the extremest cases I met with. At Corcrain National school, near Portadown, the master is a young man in the second division of the third class: his salary therefore £18 a year. His fees amounted in 1867 to £5 8*s.*, and so far from receiving aid through his patron, the parish priest, he pays 2*s.* a week (or five guineas a year) as rent for the building. This is a wretched mud-floored hovel, containing, besides the school-room, an ante-room intended for his occupation as a residence, but quite unfit for the purpose.

He has further to pay town-rate and county cess, which raise his outgoings to about £5 10*s.* a year. Thus his fees are swallowed up, and he subsists on 7*s.* a week.

Maghery Kilcranny.

197. At Maghery Kilcranny, near Armagh, the master is a middle-aged man with a family; his classification second division of second class: salary £28; fees *nil:* local contribution, not permanent, £1 0*s.* 6*d.* in 1867; for the whole year slightly over 11*s.* a week. No house is provided, and he has to whitewash the school.

Lisadian.

198. At Lisadian, near Armagh, the master is in the first division of third class, in receipt of £24 a year. He has been there for fourteen years, and is now in middle life. He is somewhat better provided for than the last, as his income with fees amounts to 11*s.* 2*d.* a week, and he has two miserable little rooms adjoining the school rent-free; they are not to be compared for comfort with a respectable labouring man's cottage. Through sleeping under a bare slate roof he had once caught a chill that laid him up for three months, during which the Board allowed him his salary. He has since constructed a sort of ceiling with his own hands, which keeps out the worst of the cold.

Drumgaw.

199. At Drumgaw the master's salary is £28, and he received £2 from local contributions in 1867. His fees are *nil.* No house is provided. His whole income is therefore equal to 11*s.* 6*d.* a week. He was trained in 1840, and was somewhat past middle age. Strange to say he was, unlike his fellows, perfectly satisfied with his means. He explained to me how he is able to subsist in what he regards as comfort. He lodges at a neighbouring farm-house, where he pays 2*s.* 6*d.* a week for board, washing, and milk. Meat he cannot afford, and never has any, but lives on bread, butter, eggs, stirabout, and tea, and he abstains altogether from strong drinks. Most of these necessaries are supplied to him cheaply from the farm; in dress he was at least as well provided as most teachers that I saw. He is able to save something every year, and this he expends in the purchase of books on natural philosophy and mathematics, in which he takes his chief delight. He is, in short, an enthusiast who does not share many of the anxieties and desires of more worldly-minded men. He might, no doubt, obtain something in the way of fees, but he objects to them in principle, and assured me that if he took money from the children he should think it right to expend it in apparatus for their benefit. Though he certainly effects a great deal on 11*s.* 6*d.* a week, I cannot say that he looked sufficiently fed, and it was clear that nothing but the spirit that is in him sustains him in contentment with his lot.

Poorest schools in county Armagh.

200. Cases similar to these could be largely multiplied, in which the income of the teacher is almost entirely derived from the small salaries of the Board. The most poverty-stricken schools were in the county Armagh; in Antrim and Down the fees are far more productive, but none the less is the visitor met with the universal complaint that the profession is starved.

School fees.

201. (2.) The second source of remuneration to the teacher is by means of school fees. This branch of the subject opens up several large and important considerations in connexion with the internal management and well-being of the schools. Whether the parent shall or shall not contribute directly to the support of the teacher, and, if he is to contribute, then to what extent the contribution can be safely levied, and in what form it is likely to be most productive, are questions which affect intimately the whole educational system of the country. Their solution depends upon a knowledge of the actual circumstances of the poorer classes, whom the decision of the matter affects, upon the abstract advantage or disadvantage of making them pay for what they receive, and upon inferences drawn from the experience of various places in which fees are or are not exacted.

Are the parents too poor to pay?

202. With respect to the parents, a great deal is said about their inability to make any appreciable contribution to the support of the schools. In the towns there are tradespeople and dealers, who can and do pay a reasonable fee; but in country districts the difficulty of collecting fees is very great, and the inference at first drawn from this circumstance is, that the people are generally too poor to pay.

They are unwilling to contribute towards the support of *State* institutions.

203. I believe that unwillingness has far more to do with the matter than inability. There are doubtless many families whom it may be well to excuse from payment, and I never found a teacher who would suffer extreme poverty to be a real obstacle to the education of a child. But all my observation tends to the conclusion that the sum actually raised by school-fees in Ireland is very much below the amount which might be raised, and which ought to be raised so long as school-fees are regarded as an integral part of the support on which the educational system of the country rests. If the system in Ireland were a voluntary one, and parents were brought up to understand that so much schooling was a commodity to be purchased with so many pence, a far larger sum would be raised than is raised under the present system. The intervention of the State has entirely altered the aspect in which the parents (I am speaking especially of those in country districts) regard the schools. The schools are not local institutions which everyone would understand to need support from local sources. They are State institutions, in which a servant of the State is placed, whose business it is to do the work which the State has set him to do. It is known that he is in receipt of a salary from the National Board, and that an official Inspector pays him periodical visits to see that he is doing his work. The very inscription over the door implies that the school hardly belongs to the particular locality in which it is placed, but is a member of a large system which covers the whole country, and which depends for its existence on certain authorities in Dublin. The effect of this on the minds of the parents is to lead them to disclaim any obligation on their part to assist in the maintenance of an institution which the State has made it its business to establish. They recognise that the teacher is under an obligation to teach their children, but they do not feel that they are under any corresponding obligation to remunerate him for what he does. He is bound to be there and teach, but they are not bound either to send their children with regularity, or to enrich the teacher by paying him over again for work which the State has already paid him to do. The parent therefore assumes a very independent attitude towards the school. He doubts the teacher's power to exact fees, and he contributes as rarely and as sparingly as possible. One master assured me that he experienced great difficulty in inducing the parents even to pay for the books which are supplied by the National board through him, so strong was the suspicion in their minds that they need not pay for them, that the master got them for nothing, and that whatever was paid for them went directly into his pockets alone. He had explained it to them often, but many of them were still not satisfied that he was not cheating them of their rights. This master had been obliged to give up all attempt to collect school-fees; the very small return he got was not worth the trouble and discomfort he had to undergo in getting it.

No sense of justice or gratitude to the teacher is admitted.

204. When, therefore, the small amount of fees collected in National schools in Ireland is quoted as a proof of the inability of the people to aid in the support of the schools, and as an argument in favour of making education entirely gratuitous, it must not be forgotten that the amount represents what flows after the very source to which we should mainly look has been stopped. A sense of justice or of gratitude towards the teacher would prompt the proper acknowledgment whenever it could be afforded. But towards a paid servant of the State notions of justice and gratitude do not arise.

Feeling of the teachers on the subject.

205. The feeling of the teachers on the subject of fees varies very greatly according to the character of the people among whom they are placed. In a town like Belfast, where a genuine competition of merit is possible, the best masters find a very considerable portion of their emoluments in the shape of fees: there is a large body of people belonging to the lower middle class of society who attend the National schools, and who really exercise some discrimination in their choice of a school. At Linenhall-street National school the fees amount to as much

TEACHERS.

as £110 10*s.* 2*d.*, at Townsend-street National school to £102 16*s.* 4*d.*, at Victoria-place to £90 15*s.*, and at Eglinton-street to £76 9*s* 1½*d.* These are I believe the four best paying schools in Belfast. To masters of such schools as these no substitute for the fees could well be provided. Among *them* there is a genuine education market, and the best man gets his price. But in poor country districts the teachers incline rather to look to the State for their reward, and despair of making much by fees. Very frequent were the complaints I heard from teachers concerning the degradation to which they submit in pressing for their fees, and in finding only too often that the return they receive is that the children are removed from the school altogether and sent elsewhere. Nevertheless the representations made to me on this subject by two associations of teachers in my district, the Antrim and the Annaghmore Teachers' Associations, are both favourable to the principle of exacting school-fees, though they agree in recommending an alternative in the form of local taxation.

206. While, therefore, the most able teachers in populous places find a stimulus to exertion and a reward for success in the fees which they are able to charge the prevailing feeling in the rural districts seems to be that the plan of charging fees in the manner in which they are now collected is highly unsatisfactory, and that the teacher's remuneration should be secured to him in some other way.

Opinion of patrons, clergy, &c.

207. But the opinion of independent observers is very decidedly in favour of the principle of making parents pay something, however little, towards the schooling of their children. I addressed an inquiry on the subject to a large number of clergymen and laymen, and with very few exceptions the replies I received are in accord on this point.

In favour of fees in principle.

208. The principle which is almost unanimously supported by patrons and others is, that in theory a charge should be imposed, but that in no case should the charge be allowed to operate as an impediment to attendance. It is considered the wiser and the better plan to keep up in the minds of the parents the idea that schooling is not gratuitous—that it has to be paid for—and that it is only by an exceptional indulgence that any particular parent is exempted. The reasons assigned for this course are briefly—

a. That the payment tends to promote a feeling of independence in the mind of the parent, whereas gratuitous schooling tends to pauperize the people.

b. That it is of great importance to inspire the minds of the poor with a respect for education, and that they will not appreciate what costs them nothing.

c. That payment of a fee secures a greater regularity of attendance, for that when a parent has paid he likes to get as much as he can for his money.

209. I take it, then, that the almost unanimous opinion of the clergy and of the educated laity is in favour of the exaction of fees in principle, combined with a large liberty of exemption for those who are too poor to pay.

Actual practice in National schools.

The actual practice in National schools corresponds in a measure with this theory; and as a general rule there is a graduated scale of fees, and a large amount of exemption. But for various reasons, to some of which I have already referred, the net result of the fees is very small; in not a few schools there are really no fees at all.

210. I have already noticed the unwillingness of parents to contribute towards a State institution; but there are other impediments which have a still more powerful effect in lowering the average rate of payment to the schoolmaster.

Causes which lower the rate of fees.

211. In the first place the schools are far too numerous, and a state of competition has resulted which is disastrous and demoralizing both to teachers and pupils. To those who have not seen the working of this competition, it may possibly sound paradoxical, but I found it to be invariably true, that the immediate effect of competition between primary schools is to lower the character of the competitors. The explanation of this phenomenon is

Competition among primary schools.

not far to seek. Competition is healthy and beneficial only if it is open and genuine, that is to say, if the competitors all start fair, and if the prize is awarded by competent judges to the best. To change the metaphor, if there were complete freedom of trade among the schools, if they were subject only to the ordinary rules of demand and supply, the best schools would survive, and the inferior schools would go to the wall. But owing to the intervention of other causes, the market is not free; the supply is not regulated by the demand, and the worse schools are not driven out of the field by their betters. The market is permanently overstocked, and all the dealers are subsidized to maintain their positions in it. Hence there ensues a scramble for customers. The price is not a consideration at all, for each dealer relies on his subsidy. The struggle is to get pupils at any cost—

"Si possis recte, si non, quocunque modo."

Usual state of the case in a country village.

212. There is the Church school supported by a residence rent free, a small local subscription, and a few pounds a year from the Church Education Society. No fees charged, but gifts of buns and clothing for all who will attend with decent regularity. On either side there stands a National school, the one adjoining the meeting-house, the other in the precincts of the chapel. The three schools among them will accommodate some 200 children, and there are only 100 children to be got. What ensues? If the priest is an active man, as he usually is, the Roman Catholics will be almost all in the chapel school; but a few of the poorest, sorely perplexed between their allegiance to their priest and the temptations held out at the Church school, will swallow their repugnance to Scripture readings for the sake of the buns and the petticoats, and go to the Church school. A few stray Protestants, too, may be found at the chapel school, who have deserted the Protestant National school in order to spite the master for having claimed, unadvisedly, his arrears of fees. The master of the Church school, who is probably also parish clerk, succeeds in keeping the majority of the Episcopalians, and in combining with them a sprinkling of the poorest of all the other denominations. At the meeting-house school will be found the main body of the Presbyterians, and a fair admixture of the Church population, especially the more well-to-do of them, for whom the charities of the Church school form no attraction.

Helplessness of the National teacher.

213. Each of the National teachers is struggling above all things to keep up his average attendance. If it falls a few points lower, he will lose an assistant, or perhaps his school will be struck off the list altogether, or at least there will be a reduction in his salary. He would rather pay the children to come than let his numbers fall. What is he to do to save himself? Of course he must not think of pressing for his fees from the poorer children, for the Church school has made that impossible. If he says a word about the arrears he will see the children no more. And then with the wealthier part of his attendance he must not be too strict, he must give no offence; for if he does his rival at the other National school will reap the benefit. He feels himself at the mercy of everybody else, unable to claim his dues, and hampered even in doing his duty. In this way the fees become depressed lower and lower, and the chances are that eventually either all pretence at charging is given up, or at best only the wealthier parents pay anything. With the exception of ragged schools, I do not think that in any free school that I visited the exemption from fees was due solely to inability of the parents to pay. The teachers, on the other hand, are constantly complaining that they cannot, because they dare not, exact their fees even from parents who could well afford to pay. I will give a few instances from information I obtained from teachers.

Instances:—Ennislare.

214. *Ennislare National School.*—"The children are all admitted free. I think the parents could pay if they had been accustomed to it; but now, when they are all free, it is a compliment to get them to send their children. They think

they are doing the teacher a favour by sending them. Since they have got a fashion of free schooling it would be impossible to make them pay, they would take and send them to other schools; for as far as I can learn, other teachers are in the same predicament as myself." TEACHERS.

215. *Lisnadill National School.*—About a mile and a half from Ennislare, and the same distance from Drumgaw National Schools, neither of which make any charge. Fees here for the year 1867 were 12*s.* Impossible to charge properly, because the school lies between these two schools. There are 56 on the roll; of whom 37 admitted gratuitously. Master is positive the parents could pay if they were willing. Lisnadill.

216. *Maghery Kilcranny National School.*—No fees at all now. "Almost all could afford to pay the amount usually charged in National schools." Master has been here since 1844. From that time till 1854 or 1855 fees were paid. He then gave up the attempt to get them, and until June, 1868 he received no fees at all. In June he tried to re-impose them on those who could and would pay. The result was that he took, in June 4*s.* 7*d.*; July, 2*s.* 6*d.*; August, *nil;* September, *nil;* and he has now given them up entirely again. The parents are chiefly small-farmers; a very few are hired labourers. The 4*s.* 7*d.* he got in June, came from only 10 parents, who had 13 children at the school among them. [The whole number of children on the roll in October was 92.] Those who paid were not better off than the average. They were—(1) An owner of a water corn-mill; (2) A widow, farming some 20 acres; (3) A shoemaker; (4) A man, farming 14 to 16 acres; (5) A man, farming 24 or 25 acres; (6) A farmer, holding unknown; (7) A farmer of 8 acres; (8) A farmer of 12 acres; (9) A labourer on about 7*s.* a week; (10) A farmer of 40 or 50 acres. The reason why he cannot get his fees, is partly that the parents are unwilling to pay anything towards his support, as he is paid by the State, but especially because Aghavilly Church school is only about half a mile off, and is avowedly a free school. If he tries to enforce his fees, the children leave him and go to Aghavilly, and he must keep up his attendance at any cost. Maghery Kilcranny.

217. Among other statements made to me by teachers are the following:—

(1.) "The fees are 1*s.* 1*d.*, 1*s.* 7½*d.*, and 2*s.* 2*d.* per quarter, but most of the pupils pay by the week. The fees are not regularly paid . . . . Many of the people are respectable farmers, some of whom can bid upwards of £1,000 for a farm; these people tell me I am paid by the Board for teaching, and that they pay the salary indirectly. On one occasion a respectable farmer (a member of committee), refused to pay the above rates for his grandson, who was in third class." Four other National schools.

(2.) "More than a third of the school do not pay anything. The Commissioners framed a rule some years ago, which gave the death-blow to school fees . . . . When the teacher acquired his class principally on his literary acquirements, they turned round on him and reduced his salary every quarter a certain number could not be mustered. Where the attendance fluctuated very much, the teacher was obliged to go about begging the scholars to attend, rather than he should lose his quarter's salary, which, in sober sadness, is scarcely sufficient to keep body and soul together. The parents saw it was a compliment to the teacher to send their children to school, and kept them at home when fees were enforced. . . . . In 1865 the Board withheld £6 from me by the operation of this rule."

(3.) "The majority of the parents are well able to pay the respective school fees, but they are under the impression because the teacher is in receipt of salary from Government that the children should be educated free, and certain parties have gone so far as to dispute the legality of the teacher demanding school fees. I have met several parents of children who say they will pay quarterly, and when they are asked, remove the children, without paying, and send them to other neighbouring schools, and leaving the school fees unpaid."

(4.) "Owing to schools being numerous, a teacher is obliged to charge the lowest possible rates so as to maintain a proper average in the school. . . . . I would suggest that National schools should be three miles apart" (speaking of rural districts).

218. Representations of this kind could be largely multiplied, but as the points adduced are very nearly the same in all cases, I give the above merely as samples of the experience of teachers in country schools.

219. In town schools the complaints are far less frequent, because the parents are on the whole better able to pay, and a really good master gets his reward. The most frequent complaints which I heard were made by teachers of National schools under Roman Catholic management, who are being underbidden by the Christian Brothers. The Christian Brothers charge but a penny a week, and as they are supported by the whole influence of the priests, it is impossible for an ordinary National school to hold its own against them. As I have mentioned elsewhere, the Christian Brothers in Belfast have a large number of boys of the better class—those who, in a National school would be paying at the highest rates. Thus the cream of the Roman Catholic population is first taken off by them, and the National schools get the residuum. From the masters of the best Protestant National schools in Belfast I heard no complaints on the score of school fees. Town schools.

220. But even in Belfast itself, through the rapid multiplication of schools and other causes, there are schools in which the fees have fallen to an almost nominal figure. I will instance two schools, in one of the poorest and least reputable parts of Belfast, the comparison of which will illustrate the peculiar difficulties which embarrass the National teacher in the collection of fees. In a miserable, squalid court, of houses whose rent is from a shilling to eighteen pence a week, I found a private school, kept by an elderly man, a Roman Catholic, who had been teaching for thirty-six years. He had been originally a cloth-cleaner in the county Mayo, where he said his family could be traced from the time of Oliver Cromwell. They had been in comfortable circumstances, and had earned a good livelihood in the cloth trade. Their capital consisted of the implements used in the cleaning process, and cost, he said, not less than £50. So good was the trade that when he first took to it as a young man, he could earn as much as £1 a day: but this did not last long. The machine wore out, and the trade was killed by the mills. He then took to teaching, and kept a private school in Ballina. Here he had hard times, and saw a child of his own die from starvation in the famine of 1847. Seven years ago he migrated with his family to Belfast, where there was a chance of his children getting work to do. In this they have been successful, and his three children are employed in the mills, where one girl earns 7*s.* a week, another 4*s.* 6*d.*, and his boy 6*s.* They occupy three ground-floor rooms, namely, a kitchen, school-room, and bed-room. The school-room is, as nearly as I could ascertain it, seventeen and a half feet by eight feet, and seven feet high; it had one small window, which, on a stifling August day, was carefully closed, while seventeen children were in the room. The kitchen was, I should say, of about the same size as the school-room. In the little bed-room at the back slept the whole family, husband and wife, eldest daughter, aged twenty-six, second daughter, aged twenty-two, and son aged sixteen. The houses being built on a slope, the back-rooms are without windows, and light and air can only reach them through the front room. And this in August! A private school in Belfast. The master.

221. The parents of the children who attend were all without exception mill-workers, and with one exception Roman Catholics. They pay at various rates, namely, 1*d.*, 1½*d.*, 2*d.*, and 2½*d.* a week. The eldest present was a boy of thirteen years, the next was ten, and the next nine years old. The rest were younger still. From these the master gets altogether 2*s.* 6*d.* a week, more or less; sometimes not more than 1*s.*, but that is only in slack times. He teaches reading and writing, and the eldest boy had begun the multiplication table; there was very little even of writing, and most of the children were merely spelling out words in books of multifarious kinds. State of the school.

222. This man, a shrewd and thoughtful man in his way, actually finds it worth his while to teach these children, drawn from the poorest class in the town, and in immediate proximity to a dozen National schools. The parents know that he teaches for his livelihood, and they, therefore, pay him for what he does. This close to a dozen National schools.

TEACHERS.

Fountain-square National school.

223. At the bottom of the street out of which this little court branches, stands Fountain-square National school, at which the fees nominally charged are, 1*d.*, 1½*d.*, and 2*d.* a week—no higher than those at the private school. The mistress informed me that though the parents, with a few exceptions, were quite able to pay the fees charged, there were fifty-one children, out of seventy-three on the roll, who had never paid her anything; while the payments from the rest were very irregular. On the occasion of my visit, on the 3rd of August, I took down from the mistress' lips her account of each of the seven children present, who stood highest in the school. It is reasonable to presume that they would not be unfavourable specimens of the whole.

1. Head boy, reading Third Book, twelve years old. His father a brass-founder, in receipt of 30*s.* a week; his mother keeps a new and second-hand clothes shop; they pay £25 a year for their house and shop. This boy has paid four times since Christmas—twice he brought 2*d.*, and twice 1*d.* Altogether, he has paid 6*d.* for fully six months' schooling.
2. Second boy, reading Second Book, eleven years old. His father a labourer, on 15*s.* a week; three children in the family. The boy and a sister of his, have been a year at the school, and neither of them has ever paid anything.
3. Third and fourth boys, brothers—ten and three-quarters, and nine and three-quarters years old. Their father blind, having lost his sight in soap-boiling. Mother and elder sister work in one of the mills, and earn respectively 15*s.* and 4*s.* 6*d.* a fortnight. The boys have been a year at the school, and never paid anything.
4. Fifth boy. Father a labourer, mother works in the mill. They get £1 a week between them. Boy and two sisters have been here for a year, and never paid.
5. First girl. Father a shoemaker, drinks. She has a brother and a sister in the school, and they pay on an average 1*d.* a week among them; sometimes one brings it, sometimes another.
6. Sixth boy. Father drives a horse and cart of his own, as a carrier, and keeps two cows. Boy has paid 3*d.* since March.

224. Another was a daughter of a file-maker, on 35*s.* a week, who has only paid three times since January, 1867, whose mother, says the mistress, excused herself from paying the fee at one time, on the ground of poverty, while she was buying a new silk dress for herself.

225. In contrast with these was a boy, son of a cooper, on £1 a week, with two children, and a delicate mother, who could earn nothing. This boy always pays. About many of the children the mistress could not speak with certainty; they are the Arabs of the town, and their parentage is very doubtful. She often has a child brought at different times, by different women, each professing to be the mother, so that she does not know who is really responsible. Of course, as one of her primary objects must be to keep up the attendance at her school, she takes all that are offered, and frequently even calls at the houses to ask for the children, when she finds them absenting themselves.

Contrast between these two schools.

226. Now, I make no question that, on the whole, the parents of the children at this school are better able to pay than are those at the neighbouring private school. There are some children belonging, perhaps, to nobody, and who cannot be expected to pay, but none of the seven children, whose circumstances I have detailed above, belong to this class; some of them may be poor, but they could all pay 1*d.* a week, and some of them could well afford more. Several of the parents are of a class clearly above the mill-workers, and the mill-workers all pay for their children at the private school.

The present mode of exacting fees is working very badly.

227. Enough has been said to show that the present system of school fees is working very badly. With parents unwilling to pay, and teachers afraid to exact, the rate of payment has been depressed far below its nominal figure.

228. The unwillingness of parents to pay what may fairly be expected from them, can only be overcome very gradually by a process of enlightenment concerning the system of National education, such as can hardly be looked for at once. To correct the present evil, it seems necessary to make the mode of exaction more effectual; and, inasmuch as it is impossible in general, for the teacher to do more than he does (for in a matter of self-interest he may be trusted to take whatever course will bring him the largest return), there remain but two alternatives under the present constitution of the schools, either to make it possible for the teacher to insist upon the payment of the prescribed fees, or else to take the collection out of his hands altogether.

Teacher should be less dependent on his attendance.

229. To make it possible for the teacher to enforce payment of his fees, he must be made less dependent on the state of his attendance. It must be a matter of less moment to him than it is, whether a child from whom he is demanding fees, pays its dues, or leaves the school to avoid payment. As long as the retention of the child, at any cost, is a matter of vital moment to the teacher, so long are the teacher's hands tied, and his coercion fails in the last resort. He urges his claim, with a full predetermination to withdraw it at the first symptom of rebellion, and the parent is not slow to find this out.

230. The object, therefore, should be, not indeed to give the teacher no interest in the number of his scholars, but to place his interest on a different footing. His interest should not be so pressing as to make him a slave to the parents and children, and yet it should be sufficiently powerful to impress upon him a general desire to maintain a good school.

231. These objects might be effected by some such plan as this, which, in a modified form, was more than once suggested to me, and which in itself seems reasonable, and likely to be efficacious.

Plan suggested for improvement in exaction of fees.

232. It might be required that, in consideration of a certain average attendance for a past quarter of the year, a certain minimum amount of fees should be guaranteed by the patron or managing committee for the ensuing quarter; for instance, if the attendance averaged fifty from July to October, the guarantee from October to Christmas might be, say, 50*s.* The degree of pressure to be exercised in enforcing payment of fees, and, indeed, the whole manner of exaction, would be matter of arrangement between manager and teacher. However it might be done, the interest in getting in the fees would be transferred from the teacher to the manager: the manager might either collect them himself, attending the school for the purpose once a week, or he might leave the teacher to act as his collector. The teacher's interest in the particular fees for the current quarter would cease, but his general interest in maintaining a large school would remain, and therefore if he were empowered to act as collector, he would always, in asking for payment, stop short of the point at which the child would be withdrawn, not because the arrears in question were material to him, but because the larger his attendance the larger his prospective guarantee in the following quarter. If the parents knew that they were really paying, not the teacher, but the manager, their tone towards the teacher would be entirely altered, and his attitude towards them would be one of greater dignity and independence. But all this would not make his position sufficiently secure with the National Board. If his average attendance were reduced to a dangerously low level, he might still be compelled to attract children at any price to his school, lest he should be mulcted by his employers in Dublin. To obviate this difficulty it would be necessary to relieve the Board salaries from liability to fluctuation on account of variations in the attendance of children. When the Board has once determined that a certain locality is a suitable one for a National school, the teacher should be deemed worthy of his hire whatever the attendance. The responsibility of deciding whether there is a sufficient population to feed a school lies not with the teacher, but with the Board. No doubt to increase the school attendance is of paramount importance; but

even this may be purchased too dearly, if the cost be impoverishment of the schools and their teachers, and disparagement to the cause of popular education. TEACHERS.

233. (3). Thirdly, there are the local contributions towards the teacher's support which the rules of the Board say the Commissioners require to be forthcoming. I have already stated that in my district nearly half the patrons in the county Armagh, and all but about fourteen per cent. in Belfast and the counties of Antrim and Down neglect this source of income altogether. The total amounts so contributed in the year 1867, are as follows :— Local contributions exceedingly small in National schools.

				£	s.	d.
Belfast, out of 64 schools, 9 were aided by subscriptions,			=	131	13	8½
Co. Antrim, ,, 117 ,, 11		,,	=	48	7	10
Co. Down, ,, 61 ,, 18		,,	=	161	9	0
Co. Armagh ,, 74 ,, 38		,,	=	374	3	9
Total, 316	76			£715	14	3½

234. The average contribution to each aided school is £9 8*s.* 4*d.*, and spread over the whole 316 schools, the average would be £2 5*s.* 3*d.* per school. The total amount is quite an insignificant sum, and the teachers generally do not look to this source of remuneration at all. Average amount.

235. It is not to be expected that the National schools can obtain the same measure of local support as is accorded to the Church schools. The Church schools have the sympathy and aid of a large proportion of the wealthiest class. The clergyman of the Established Church generally carries with him some of the larger landed proprietors, and thus forestalls the National schools in the richest quarter. As a body, too, the members of the Established Church are the wealthiest of all the communities—their clergy especially having an advantage over the priests and the Presbyterian ministers. But the chief reason for the more liberal support granted to the Church schools is that greater exertions are made to procure assistance for them. Without local aid they would die out, unless subsidized by the Board of Erasmus Smith's Charity. It is proved that National schools *can* subsist on nothing but the State grant, and so the pressure is taken away from their patrons, and little is done to aid them. The Church schools have the spur of necessity on their side. Larger in Church schools.

236. Occasionally a National school not only receives no local aid, but even the Board grant is partly absorbed by necessary expenses, which ought to be met through the patron, and does not come as a net sum to the teacher. I have mentioned that the master of Corcrain school pays £5 10*s.* a year out of his slender earnings in rent and rates. The master of Zion-place school in Newtownards pays £4 a year to his patron for the use of the space which is used for the school underneath his meeting-house ; and frequently the teacher is at the expense of any small repairs that may be required. All such abatements from the teachers' salaries ought to be impossible, but they become mere matters of arrangement with the patron, and the teacher really has no voice to raise in his defence. National teacher sometimes has to pay for his school.

237. Under some such plan as I have suggested for the better enforcement of school fees, local contributions would be more thoroughly recognised as part of the educational system, and that a far larger amount of support would be readily forthcoming is beyond a doubt. If this statement should be questioned, I would call attention to the fact that in Armagh, which is a far poorer district than is the neighbourhood of Belfast, the amount of local aid now contributed is relatively far more considerable than it is either in Belfast or in the districts around Carrickfergus, Antrim, and Newtownards. Contributions are larger in county Armagh than in Antrim and Down.

Section V.—Instruction—(*a*) Religious.

238. In all the National schools which I examined I avoided religious knowledge entirely, and I paid it no special attention in other schools. I have therefore nothing to report concerning the results of the religious teaching in informing the minds of the children on sacred subjects.

239. Nor do I propose at this stage to enter upon the momentous questions which turn upon the religious or non-religious character of National schools. At present I am dealing simply with the practice of National schools, and not at all with the theory on which their operations are based. I shall, therefore, not inquire here into the expediency or inexpediency of this or that educational system in regard to its provisions for religious teaching. I merely take the rules of the National Board as they are, and propose to explain in what ways they are carried out at the present time. This section deals with practice only.

240. The rules prescribe that religious instruction may be given either at the commencement of school or at the close of school, or at one, and only one, intermediate time ; that the period or periods allotted for religious instruction shall be advertised on the school time-table, and that during its continuance a notice shall be exhibited in prominent type in the room, to be replaced by a similar notice of secular instruction when religious instruction is over ; the two kinds of instruction are to be kept entirely distinct, and no child of a denomination different from that of the teacher is to be suffered to remain in the room during religious instruction, unless his or her parent or guardian has signed a certain certificate, with prescribed formalities, expressing a desire that the child shall attend. Rules of the National Board concerning religious instruction—

241. The rules regarding religious instruction, it should be noticed, are only permissive ; no school is bound to afford any such teaching ; but every school that does afford it must conform to these regulations. The Inspectors of the National Board take no cognizance of this branch of the instruction in their examinations, and in strictness the religious element is an extra to the system, permitted, but not incorporated with it. Permissive only.

242. The practice of the National schools in this matter takes three distinct forms. Either (1) religious instruction is given to children of different denominations in the same school by clergymen or teachers of their respective creeds in separate apartments, or (2) religious instruction is provided for one denomination only in the school, and the rest go without, or (3) there is no religious instruction given to children of any denomination. My district comprises instances of each kind. Practice in National schools takes three forms.

243. (1). The first method which provides every denomination with its own separate religious teaching is in practice at the model schools, is prescribed at all schools whose buildings are vested in the Commissioners, and is occasionally, but very rarely, in operation at non-vested schools. The plan presupposes an attendance of children of various denominations ; in unmixed schools there is no call for it. The most complete instance I met with was at the Whitehouse (non-vested) National school, not far from Belfast, where, when the time for religious instruction arrives, the Roman Catholics are collected in the infant school-room, under the Roman Catholic teachers, and are there regularly visited by their parish priest. The children of the Established Church occupy a recess in the main school-room, under an Episcopalian teacher, and the Presbyterians are assembled at the end of the room farthest from the recess. In this way full opportunities are afforded for distinctive teaching in three forms ; and the perfect equality which exists among all denominations gives satisfaction to each. (1) Separate religious instruction for each denomination. At Whitehouse.

Instruction, Religious.

At Holywood.

244. At Holywood (Dr. Sullivan's) National school, also non-vested, the same facilities are afforded, and the Roman Catholic children meet in rooms apart from the rest, and are attended by the Roman Catholic assistants. The practice here falls short of that at Whitehouse in completeness only in this particular, that in consequence of the exclusion of the parish priest from the committee of management, the circumstances of which I have already detailed, he does not give the children of his Church the benefit of his instruction there. The work is left to the teachers alone. Still, as far as the school and its staff are concerned, the plan of separate religious instruction for each denomination is fully carried out.

At Aghanlig.

245. In one other school, of more humble pretensions, separate arrangements are made for the religious teaching of Roman Catholics and Protestants. This is Aghanlig National school, in the county Armagh, where the master, a Roman Catholic, sends the Protestant children to a house close by, which is allowed to him as a residence, but which he does not occupy, where they are attended by the monitress, who belongs to the Established Church. The plan works, the master informed me, perfectly well, and having Protestant children under his charge he is glad to have a Protestant assistant to see to their interests.

246. I very much wish that I could have met with more instances of this kind, to enable me to form a judgment from a wider experience on the working of this plan, which is, in fact, the original idea of Lord Derby in the initiation of the Irish National system.

No difficulties experienced where there are separate rooms,

247. That in schools where there are more rooms than one, and teachers of each denomination, any practical inconvenience or confusion can arise is, I think, impossible. It is only necessary for a definite time to be fixed at which religious instruction shall be given simultaneously in the different rooms, and then the clergy of each denomination, if they wish to assist, can time their visits accordingly. Whether they attend or not, they know that during this time none but teachers of their own creed are with the children, and except at this time religious subjects are absolutely prohibited. It would seem likely, therefore, to meet the convenience of all, if only all are willing to co-operate on equal terms. At Whitehouse they do so co-operate, and though there is a preponderance of the Protestant element in the school, the priest expresses himself in terms of satisfaction with the arrangements made. He lives at peace with his brother clergy, and they with him, and the school receives their concurrent countenance.

e.g. at Whitehouse.

Exceptional circumstances at Holywood.

248. If the state of things in Holywood is different, the causes also are different. Were all the Protestant clergy in and about Whitehouse combined as a board of management of the Whitehouse school, and were Father Ryan, the parish priest, excluded, I should have little hope of the continued peace of the place. No doubt there are priests and priests, and I cannot pretend to say how Father O'Laverty, of Holywood, would act if Dr. Sullivan's schools were, like the school at Whitehouse, free from clerical patronship altogether, and if all the ministers of the place were on an equal footing with regard to it. He might be content or he might not. But if he were discontented he might well be asked to show his grievance, which now, unfortunately, is only too palpable.

The plan successful, where tried.

249. Therefore, of the two cases, the one I consider normal and the other abnormal. From the dissensions at Holywood I can draw no inference. The test was warped from the commencement by an early act of intolerance. From the experience at Whitehouse alone is any inference justifiable, and that is entirely favourable to the method under discussion. So far as it goes, the case of Aghanlig is corroborative. It illustrates a state of feeling of which I observed very frequent indications among teachers of all creeds—namely, a readiness or even a positive wish to be associated with teachers of a different denomination from their own.

But not generally practised even in ordinary vested schools.

250. Though, as I have mentioned, the regulations of the National Board require that facilities for separate religious instruction should be provided in all vested schools, this school at Aghanlig, which is vested in trustees for the purpose of National education, and falls within the definition of vested schools, is the only case of the kind in which I found the requirement actually carried out. In other cases there was no mixture of denominations on the teaching staff, and the clergy had not claimed their right of access.

(2) Religious instruction for one denomination only.

251. (2). The great majority of the schools conduct their religious instruction according to the second method; in other words, patrons of non-vested schools usually exercise their right of declaring what kind of religious teaching shall alone be given in the school. If in a Protestant school there be any Roman Catholic children in attendance, or *vice versa*, the rule at once comes into operation which requires the teacher not to permit the presence during the lesson of any child of the other creed, without a formal certificate from the parent or guardian. The most usual time for the lesson is either from 10 to 10.30 A.M., or from 2.30 to 3 P.M. If the school be a mixed one as regards religious denominations the dissenting children either come half an hour later, or are dismissed half an hour earlier than the rest.

Inconvenience of this plan when religious instruction precedes secular.

252. Considerable inconvenience arises when the early hour is chosen, if, as is usually the case, the school-building contains only one room. A great many of the schools in Belfast have separate rooms, but then in Belfast there is scarcely any genuine mixture of denominations. It is in country schools that a mixture is chiefly found, and these are the very schools that have least accommodation. The inconvenience of which the teachers mostly complain is that the rule compels them to keep children waiting, it may be in rain, snow, or cold wind, outside the school door, if they arrive too early. As the schools do not commence till 10 o'clock, and the children, especially if they come from a considerable distance, have no means of knowing the precise time of day, it very frequently happens that some of them arrive too soon. In fine summer weather this is of no consequence, but in cold and wet weather it tests the firmness of the teacher very severely to require him, on seeing a child come shivering in, with bare feet and wet clothes, to turn it out again, and leave it to while away the time as best it may outside. Unless he does this he is infringing a peremptory rule of his employers.

The book of certificates usually blank; five instances in which it was in use.

253. The book of certificates which the Board supply to each school is almost always a complete blank. I find only five schools which I visited where use was being made of the certificates. One of these is a town school under Protestant management, attended by a very poor class of children, where the book contained eleven forms filled up by Roman Catholic parents, of which eight had expired, and three were in force for children still in attendance. Only three out of the eleven parents had signed their names, the rest had made their mark, attested by a witness's signature. The children comprised in the certificates read the Scriptures with the rest; other Roman Catholic children are excluded during the Scripture lesson. The second school is a large country one in the county Down, also under Protestant management, where more than one-fifth of the children are Roman Catholics. The book contained two certificates, both referring to children the offspring of mixed marriages; in the one case the father was a Roman Catholic and the mother a Presbyterian, and a note attached to the certificate stated the father's desire to withdraw the permission, on the ground, as the master said he stated, that he had been told to do so by his priest. In the other the father called himself a Roman Catholic, the mother being of the Established Church, but subsequently the father had come and desired to change his own denomination to that of the Established Church. Both of these certificates were therefore no longer operative. The third instance was at a country school in Armagh, also under a Protestant teacher, where one Roman Catholic boy attended the reading of the Scriptures under a certificate, whereas

fifteen others did not attend. The fourth instance was at a country school in Antrim, where there were eleven Roman Catholic children named on the roll, though three of these had in point of fact now left. All of them attended religious instruction with the Protestants, under certificates desiring that they should be present at the reading of the Scriptures. The Protestants are partly of the Established Church and partly Presbyterians, and the head teacher, of the Established Church, hears each of the Protestant denominations say its own catechism, and simply omits the Roman Catholics from this portion of the lesson. In the fifth and last case, also a Protestant school, the book contained three certificates, of which two had expired; the third relating to a brother and sister, was still in force.

Two instances of direct infringement of the rules.

254. At this last school there were nine other Roman Catholics on the roll for whom there were no certificates, but none the less they attend during the time allotted for religious instruction like the rest; this is from 10 to 10.30 A.M. The Protestants say their catechism, and in this the Roman Catholics do not join, but such as are old enough to do so read the Scriptures in class. On the day of my visit seven of the eleven Roman Catholics were in attendance, of whom three were sufficiently advanced to take their places in the Scripture reading class, and had done so accordingly. The teacher explained the matter by saying that she always tells the parents that they are not to send their children till 10.30 if they wish them not to receive the religious instruction; but in spite of this they do send them, and she does not reject them. They have a dislike to signing or setting their mark to a document, but have confidence in her, though they know she is a Presbyterian. The one certificate she had, mentioned not only the Scriptures but also "the Protestant Catechism;" elsewhere the Scriptures only were named. This is not altogether a solitary instance of direct infringement of the rule which the Commissioners of National Education have laid down. At one school, attended chiefly by very young children, and really little more than an infant school, I found the religious lesson going on at the time of my visit, and four Roman Catholic children present under a Protestant teacher and classed with the rest; but the certificate book contained no entries. The attendance was by no means exceptional; the day was fine and not cold, so that there would have been no harm done by keeping them waiting, and moreover the teacher allowed that they attended, as a matter of course, every day. The instruction was confined to the Scriptures and the Commandments, without any kind of catechism.

Instance of incomplete compliance with the rules,

255. At a third school, one under the management of a Presbyterian clergyman in Belfast, where a minority of one-tenth of the children is Roman Catholic, the master allows the Roman Catholics in wet weather to wait in the room till religious instruction is over, but they do not join in it. One boy, he told me, always comes at ten o'clock and reads his Second Book by himself till half-past ten. Other very little children who cannot be trusted by their parents to go to school alone amid the dangers (and they are not slight) of the cars in the streets of Belfast, are always sent in charge of some older child; a Roman Catholic infant therefore often comes at ten o'clock under the protection of a Protestant; to turn the little one out alone into the street would be to expose it to the very danger against which its parent has endeavoured to guard it, and rather than do that, the teacher suffers it to remain.

probably not infrequent.

256. That to the extent of this last case some laxity prevails in other schools is, I think, extremely likely, for exact compliance with the rule appears to many teachers to involve little less than cruelty, and it must always be troublesome in a one-roomed school.

257. The objections, then, to separate religious instruction for one denomination only at the commencement of the school work seem to me clear. The daily temptation to the teacher to save trouble by not strictly enforcing the rule is inevitable.

Objections to plan when religious instruction succeeds secular,

258. But in many schools it is the last half hour that is devoted to the religious lesson. Against this plan, too, the teachers urge two objections of opposite kinds and yet to be explained on identical grounds. On the one hand it is said that the dismissal of the minority half an hour earlier than the rest appears to the majority in the light of a special favour which they resent. The master of Derrytrasna school, in the county Armagh, which is under the parish priest, and had at the time of my visit fourteen children of the Established Church, and eighty-eight Roman Catholics on its rolls, told me that at one time he used to have religious instruction from 2.30 to 3 P.M., but that after the dismissal of the Protestants at 2.30 he lost much of his control over the rest; they became "fidgety," and wanted to go too, and this had become so serious an inconvenience that daily religious lessons had been abolished, and now the only time devoted to religious teaching is from 10 A.M., to 12 on Saturdays, when, of course, the Protestants do not come. The contrary objection which I occasionally heard is that the dismissed minority feels aggrieved in that it receives less of the teacher's time and attention than the rest—a grievance likely to be felt more acutely by parents than by children.

arising out of a sense of inequality.

259. Both these objections, whatever their force may be, are to be referred to the same source; it is the sentiment of inequality in either case that causes the difficulty. Whether a privilege be in itself desirable or not, the bare fact that it is a privilege suffices to produce discontent in many minds, and whether a parent cares about a lesson in religious knowledge or not, what he dislikes is that there is something which one class of children gets, and which his child does not get.

260. It may be possible to guard by a more complete system of checks against any abuses of this system, by which one denomination alone receives a lesson of which the rest are deprived; but the inequality in any case remains, and will always produce its fruits.

(3) No religious instruction in school at all, as in the Belfast factory schools,

261. (3.) All the complications and difficulties which are raised by methods of religious instruction are entirely avoided in some schools by the simple process of having no such instruction at all. They cut the knot rather than attempt to unravel it.

262. In towns the only schools in which I found a purely secular system at work were the Belfast factory schools, which are all under the National Board. These are the only genuinely mixed National schools in Belfast, and the managers are usually millowners, whose sole object is to comply with the Factory Acts. They employ their hands without regard to religious differences, and they wish all to go on smoothly and uniformly in their schools. Accordingly Campbell's-row, Leeson-street, Winetavern-street, and the Milewater Mill National schools have no religious instruction at all. Pilot-street (Girls' school,) having access to a separate room besides the main school-room, is entirely secular so far as the mill children are concerned; and at Edenderry National school (Ardoyne), religious instruction takes place from 12 to 12.15 P.M., and as the morning set of mill children leaves at 12, and the afternoon set arrives at 12.30, they both avoid this lesson entirely.

and in three county schools, viz., Blackwatertown,

263. In three country schools, too, that I examined, no religious instruction is given. One is at Blackwatertown, in Armagh, under the patronage of the Rev. Canon Coyne, P.P. of Moy. He is patron of several other schools beyond the limits of my district, and in none of them is any religious instruction given. Blackwatertown school had on its rolls when I visited it thirty-two Protestants and 192 Roman Catholics, and is the only school in the place. Father Coyne told me that his reason for prohibiting religious instruction in his schools was to avoid all chance of bickerings and unpleasantness with his Protestant neighbours. He therefore assembles the children at certain times in his chapel, where he or his curate meets them. Usually it is arranged that the children shall go straight from school, at three o'clock to the chapel, and on these occasions they receive

Instruction, Religious.

notice beforehand to be prepared for an extra hour. The master highly approves this plan, which relieves him of all risk of suspicion or misunderstanding with the parents.

Blundell's Grange,

264. At Blundell's Grange school, also in Armagh, there has been no religious instruction during the seventeen years which the present master has spent there. It is a mixed school (twenty-six Protestants, to 123 Roman Catholics) under Protestant patronship, but with a Roman Catholic staff of teachers. The Roman Catholic children are instructed in the chapel on Sunday mornings by the priest.

South Taylorstown.

265. South Taylorstown school, in the county Antrim, may be referred to the same category. I have already pointed out that this is a very evenly mixed school under a Protestant lay patron, and with Roman Catholic teachers. On five days in the week the work is entirely secular, and on Saturdays is held what I saw nowhere else—united religious instruction, confined to the use of the book of Scripture Extracts which is now generally fallen into disuse. All denominations attend alike.

Combined religious instruction now nearly extinct.

266. With this exception, combined religious instruction, as it used to be when Archbishop Whately was on the National Board, has, so far as I know, died out in this part of Ireland. I met with two teachers who had in their earlier days contrived to satisfy the religious wants of all denominations of children in a more complete manner than by the mere reading of the book of Scripture Extracts. The master, a Roman Catholic, of a National school in the county Down told me how he had been in the habit of hearing, one after the other, children of the Established Church, Roman Catholics, and Presbyterians, say each their own catechism. He would hold the three books in his hand, have the children up promiscuously in class, and ask them questions in the order in which they stood, each from the appropriate book, and he says no difficulty ever occurred either with children or parents. All were treated alike, and no one could complain of unfairness. Another Roman Catholic master told me that he had formerly been in charge of a mixed school in the county Tyrone, and in Scripture reading his plan was to range all the Protestant children, and all the Roman Catholics on opposite sides of the room; he himself would stand between them with a Bible in the authorized version in the one hand, and the Douay version in the other; he would then make the children read from either side alternately, the one row being provided with Bibles of the one kind, and the other with Bibles of the other; and thus he had an opportunity of acquainting himself with the merits of both versions, and the children of both creeds were equally served and satisfied. Such easy combinations, however, are no longer possible.

Relative merits of the three plans.

Desire of teachers to be relieved of religious instruction.

267. In estimating the relative advantages of the three courses which are adopted in National schools with respect to religious instruction, it deserves to be noticed that there is a wide-spread desire on the part of teachers of all denominations to be relieved of the responsibility of religious instruction entirely. Wherever that plan is followed, the teacher expresses satisfaction at it; in schools where the teacher is not so relieved, one is met by a constant complaint that in undertaking religious teaching he is called upon to pass beyond the limits of his proper sphere, and to enter upon that of the clergyman; he would rather avoid the difficulties with which the religious question is surrounded, and confine himself to those subjects which are included in the secular course, and in which alone he can gain credit with his employers. I mention this matter here, because it seems likely to have an important bearing upon the effectiveness of the religious instruction as given by the teachers. A man does nothing well that he does not do "with his might." In religion more than in anything else if there be no enthusiasm in the teacher, there will be little effect on the mind of the taught, and there is danger lest such effect as may be produced may be very different in character from that which is desirable. A languid pointless lesson in religious knowledge will very probably generate a distaste for all things religious, but cannot possibly quicken a love for them. The best wish that can be bestowed on all such exercises is that they may be without effect.

The first and the third alone satisfactory.

268. These considerations, combined with the proved inconveniences and the confessed inequality of the system of separate religious instruction for one denomination only, point to the conclusion that of the three methods we have been discussing, the first and last alone admit of satisfactory working. The first should be made effective by the frequent presence of the clergy of all denominations to supply what may be wanting on the part of the teachers as instructors in religion. Under the last the whole onus of religious instruction lies with the appointed ministers of religion. The one affords religious instruction equally to all, the other equally to none. Any other method must be wanting in the great principle of absolute equality.

(*b*) Secular.—*Reading.*

Reading usually harsh and unrefined.

269. In the north of Ireland the reading is spoiled very much by the local twang. When "school" is pronounced as "schuil," and "wool" as "uil," it may be understood that an Englishman has some difficulty in passing a judgment on the reading he hears in Belfast. But after allowing for all peculiarities, I cannot say that the reading is generally other than harsh, slovenly, and unpleasant to listen to. The harshness and slovenliness are generally much more conspicuous in boys than in girls; the girls' voices are clearer and more under control, and their articulation more distinct, than are those of the boys. They seem to have clear physical advantages which save their reading from the imputation of coarseness that usually attaches to that of the boys. Correctness of emphasis and tone, or a regard for rhythm and cadence are scarcely ever met with, and one looks in vain in most schools for traces of any systematic instruction on these refinements. To spell out the word and pronounce it, seems to be regarded as the sole requirement.

The National reading books full of long words.

270. I do not hesitate to attribute a great deal of this defect to the reading books of the National Board, which seem to me to entail upon the children such constant regard for individual words, as to draw off their minds from the flow of clauses and sentences. So many difficult words are introduced that the whole attention is every now and then broken off from the course of the sentence, and concentrated upon the dissection of one polysyllable. It is altogether useless to introduce children to long compound words, which there is no probability that they will ever meet with again, and which by the continual checks they give to the reading, destroy the interest in the subject-matter. At one of the first schools I examined, I found a class of young girls—about ten years old—reading the Third Book, who told me their lesson for the day was at p. 86, "The Daw with the borrowed feathers." I told the head girl to begin. She began "A"——, and there she stopped vainly endeavouring to analyze the next word, which, of all words in the world to put before a little shoeless girl of nine or ten years, was "pragmatical." She could not pronounce the word, still less could she understand it. It is true that in a list of synonyms at the head of the lesson this word is represented to mean "meddling" ("meddlesome" would perhaps be an apter synonym), but how can it benefit a girl of this rank, and at this age, to have her memory incumbered with a Greek derivative, which she will never see out of her Third Book, and which is to her but a strange and meaningless substitute for a familiar and forcible word?

The Third Reading Book.

271. Not a few children are in the Third Reading Book at eight or nine years of age. In the very first sentence of the book they have to master such words as "*reclaimed*," "*subservient*," "docile." And such sentences as the following in the first lesson, contain words which, to most children of that age, convey no idea at all. "Assiduous

in serving its master . . . it is *indifferent* to every one else:" "*disarm* resentment by *submission*:" "*Extraordinary* sagacity and *acuteness* of scent:" "useful and estimable *properties*:" the italicized words, as well as the following, *apparatus, inveterate, unshrinking fortitude, anecdotes*, and others, are not considered to require any explanation in the heading. I need go no further than this first lesson, to show what I mean when I complain that the attention of the children is concentrated on the dissection of separate words. Such reading lessons seem to me to secure for the child the maximum of irksomeness with the minimum of intelligibility.

Instances of good class-reading.

272. The best reading I heard was from some of the head girls at the Belfast Model school (the only Model school I visited), and the head boys at the Barrack-street school of the Christian Brothers in Belfast. The Christian Brothers pay great attention to reading, and by means of simultaneous recitation—a whole roomful of boys joining in chorus, and repeating sentence by sentence after the brother has shown them the correct tone and emphasis—the boys get much more practice than they would do if each merely read a sentence or two by himself. If I were to find any fault with the reading of the two classes I have mentioned, it would be that the attempt to give the correct tone and emphasis was too manifest, and the reading, therefore, wanting in ease and naturalness. In the best ordinary National schools the reading in the upper classes is generally fluent enough, and it is finish only that is almost universally wanting.

273. Among little children I was struck by particularly good reading from a class of girls in the Second Book at Donaghadee (Hunter's-lane) National school, of the average age of nine years.

Need of an intermediate book between Second and Third.

274. A great many teachers regret the withdrawal of the "Sequel" reading book, intermediate between the Second and Third Books. They very truly urge that if a child is making slow progress, it may stay so long in the Second Book, unfit to be promoted to the hard-words of the Third, that it comes to know many of the lessons almost by rote. I have frequently found that this was the case when I was hearing reading lessons. Moreover, the transition from the Second to the Third Book is considered to be too violent in point of difficulty.

Complaint of the Nuns at Hamilton-street convent concerning the Reading Books.

275. Otherwise the teachers generally seem well satisfied with the books, excepting the nuns, who ask for an admixture of Roman Catholic doctrine in the lessons. The sisters at the Hamilton-street convent in Belfast, go further and complain that the tone of the books is objectionable in point of morality, and that they contain many pieces "quite unfit for young girls." They instance from the Fourth Book, "The braes of Yarrow," commencing—

"Thy braes were bonny, Yarrow stream,
When first on them I met my lover;"

Tennyson's "Mariana;" Campbell's well-known "Caroline," commencing—

"I'll bid my hyacinth to blow,
I'll teach my grotto green to be;
And sing my true love all below
The holly bower and myrtle tree."

the scene from the "Tempest," between Ferdinand and Miranda, pp. 357-9, and that from the "Winter's Tale," pp. 383-5. They also speak of "The character of the educated gentleman," pp. 359-61, as instilling the poison without the antidote: and indeed the concluding paragraph of the passage, in which he is referred to as (if he be an unbeliever), "a friend of religious toleration . . . because his philosophy has taught him to look on all forms of faith with an impartial eye," is not likely to be acceptable to ardent religionists, whether Catholic or Protestant, or of any other persuasion.

Writing.

Generally bad in National schools; better elsewhere.

276. Of the writing I have no difficulty in pronouncing it as on the whole bad in National schools, and on an average considerably better in Church schools. I have been often surprised at the complacency with which teachers have shown me copybooks slovenly and dirty beyond all excuse. Out of all the National schools in which I examined the writing, only nine showed me what I regarded as satisfactory. These schools were—in Belfast, Crumlin-road convent school, Linenhall-street, St. George's, and Townsend-street. Comber National school No. 1; Donaghadee (Hunter's-lane); Kircubbin; Lurgan (Watson's-lane), and Portadown (Edenderry). In some of these it is only the writing in the highest class that I speak of. Of the Church schools, writing was good at the Mall and the Drelincourt Charity schools in Armagh; at Bangor Lodge school (girls); and at Kilmore and Loughgall (Erasmus Smith's) schools.

A free style of practice the best.

277. In a very large number of National schools, Mr. Vere Foster's copybooks are used, one peculiar feature of whose system it is to guide the child's hand, in the earlier stages, by four sets of lines instead of only two. There are two lines to enclose such a letter as *m*, and two wider lines to prescribe the height and depth of the *h's* and the *g's*. Though I do not wish to claim much weight for my opinion on this matter, I must record the fact that I never found copies written under so many leading strings as these to be much better than scrawls. The effort to meet all four conditions seems to be too much for beginners, and I always found better results from the use of the old-fashioned large round-hand copybooks. These are used to good purpose by the Christian Brothers in Belfast, who produce very satisfactory results in handwriting. At the best Church schools, too, in which I saw writing which, I think, pleased me better than any other, the results had been achieved by a free style of practice.

Dictation.

278. To write from dictation is a very useful test of a child's acquirements and intelligence, for this is the form in which the fruits of its education are most frequently put into practice in afterlife. I append records of some of my examinations in order to show the character of the work done for me in this subject at National schools.

INSTRUCTION—SECULAR. *Dictation.*

Specimens of work in dictation in National schools.

1. Passage :—"This unfortunate man had not lain long quiet in the cavern before he heard a dreadful noise which seemed to be the roar of some wild beast, and terrified him very much."

Averages,	13⅓	1·5	11½	1·1	12⅜	1·8	13⅝	1·8	13¾	1·3	12¼	1·7

279. These latter six schools are all of the better class; indeed it is only in the better class of schools that the Fourth Reading Book is in use at all. For like reasons, though the dictation of the third class at Armagh Convent School and at the Old Lodge-road School is the lowest in the list No. 1, I do not mean to imply that those are the worst schools I saw. In the worst schools of all there would scarcely be a Third Book class at all, and if there were it would require an easier passage to test it with.

Instances—Comber, No. 1.

280. As instances of the extremes among National schools I may name the following :—

At Comber National School, No. 1, the Fourth Book class, consisting of 3 girls and 13 boys, was of the average age of 12⅞ years—from 10¼ up to 18¼ years old. They wrote six lines of medium difficulty from the Third Reading Book with only ten mistakes among them. Ten of the exercises were perfectly correct.

Edenderry (Portadown).

281. At Edenderry National School, Portadown, a rather difficult passage, adapted from the Third Book ("We one day descried some shapeless object drifting at a distance. At sea everything that breaks the monotony of the surrounding expanse attracts attention. It proved to be the mast of a ship that must have been completely wrecked. There was no trace by which its name could be ascertained") was written out by the fourth class, containing 5 girls and 12 boys, with an average of 1·8 words misspelt by each. Three boys were perfectly correct.

Townsend-st., Belfast.

282. I set the same passage to the fifth class at Townsend-street School, in Belfast; it contained 4 girls and 10 boys; they made on an average 2·3 mistakes each; and 2 boys and 1 girl made no mistake.

Linenhall-st., Belfast.

283. At Linenhall-street, Belfast, the fifth class of 13 boys wrote out six rather hard lines from the Fifth Reading Book with only sixteen words misspelt altogether, or on an average 1·3 for each boy. The average age of the boys was 13¾.

284. These, with the schools whose doings are recorded in the second of the above tables, as well as those marked "A" in the first table, give the best results I met with at National schools.

Armagh Female National school.

285. Among the worst performances I saw was that of the Armagh Female National School. I gave the third class this passage—"Having formed this resolution, he took an opportunity of leaving his master's house, and hid himself in a thick forest, which was at some miles' distance from the city; but here the unhappy man found that he had only escaped one misery to experience another." There were 10 girls in the class of the average age of 11¾ years. Three made, respectively, one, three, and six mistakes each; the next best made eleven; and the other six wrote mere unintelligible fragments. It is a Roman Catholic school, injured by competition with the nuns. Seventy-nine girls were present, of whom five were in a class above the third, and wrote out the same passage with five mistakes apiece on an average.

Maghery Kilcranny.

286. At a very unpretentious country school at Maghery Kilcranny, the third class (aged 13 on an average)

made but two mistakes each in this same passage; and at Comber No. 1 School the upper draft of the third class did equally well, though the average age of the class was but 11 years.

Instruction—Secular. *Dictation.*

287. The majority of large National schools would be represented by those marked "B," in the first of the two tables given in paragraph 278. I should set them down as fair specimens of the average quality. For large schools as they are, the dictation at the Armagh Convent School, the Armagh National, and the Old Lodge-road School, is decidedly below the average; but in some small schools, especially in rural districts in the county Armagh, even this very small modicum of success would not be forthcoming. I cannot say that I consider the type represented by schools "B" to show satisfactory results in this subject, and my opinion of the dictation in National schools generally must follow accordingly.

On the whole, dictation not satisfactory.

288. Dictation was done satisfactorily by a few children at the top of several of the better Church schools; but the descent from the small leading class to the next grade in these school usually exhibited a very rapid deterioration. The best in this respect were at Armagh, the Mall school (boys' department), and the Drelincourt School, and Erasmus Smith's Schools at Antrim, Loughgall (boys' department), and Kilmore (girls' department).

Dictation in Church schools.

289. The head classes in the two schools of the Christian Brothers at Belfast were quite on a level with the head classes in the best National schools in this subject.

In Christian Brothers' schools.

Arithmetic.

290. In this subject, which forms perhaps the severest test to which National school children can be submitted, I propose to follow a course analogous to that pursued under the last head, and to show what were the actual performances of the children at schools of various degrees of excellence. The sums were always worked by a class standing around me and under my immediate supervision. My plan was to dictate one sum only at a time, and have it forthwith worked out and marked before I dictated a second.

Mode of examination.

291. I. I first give the work of the highest classes at Townsend-street and Linenhall-street National schools in Belfast as specimens of the best work I met with. The sums I gave were not identical at the two schools, but they were in the same rules, and as nearly as possible of equal difficulty. I gave one sum under each head, and if it was done correctly I marked 1; if nearly correctly, ·5; if incorrectly, 0. At the foot of each column, I give the per-centage of sums done in the two schools combined.

Specimens of work done in arithmetic in highest classes (Fifth Book) at two of the best National schools.

Fifth Book Classes.

Name of School.	Sex.	No.	Age.	Simple Subtraction.	Simple Division.	Compound Multiplication.	Simple Proportion.	Vulgar Fractions.

	,,	12	13½	1	1	1	1	1
	,,	13	14⅜	1	1	0	·5	1
Average age, and per-centage of sums done, . .			13⅝	100·	88·8	85·1	72·2	77·7

292. In other words out of the 135 sums (five sums apiece to twenty-seven scholars) 114½, or 84·7 per cent. were correct, and out of twenty-seven scholars only one, a girl, failed to obtain something more than half-marks. This result is, I venture to think, very satisfactory. The multiplier in the third sum was 27. The form of the proportion was—"If —— men earn £—— —— *s.* —— *d.* in —— days, how much will —— men earn in the same time at the same rate?" in which the introduction of a specified number of days in the hypothesis always proved to be an insurmountable difficulty in inferior schools. The questions in vulgar fractions involved reduction of several fractions to a common denominator and subtraction at Townsend-street, and multiplication and division at Linenhall-street.

84·7 per cent. of the sums were correct.

293. I gave a similar series of sums to the fourth, or highest, class at Edenderry National School, in Portadown, also a good school. The class consisted of 11 boys and 5 girls of the average age of 13½ years; but the number of sums done was only 54 per cent. of the whole, as against 84·7 at the two Belfast schools. The comparison, however, is not on equal terms as the Belfast schools had each a fifth class professedly more advanced than any of the Portadown scholars. Still the age of the scholars was about the same.

Edenderry National school (Portadown).

294. I mention this to show that the work at Linenhall-street and Townsend-street schools is very much above the average of excellence; indeed, as far as my experience of schools in Ireland has extended, I doubt if it would be equalled in any schools I examined except in the highest drafts of boys (used as monitors) at the Belfast Christian Brothers' Schools. Very few schools have a class in the Fifth Reading Book at all.

These instances far above the average.

295. The specimen I have given will suffice to show the method I pursued in marking for sums done; in the records of my examinations which follow it is to be understood that I have condensed the notes which I made at the time in exactly the same way and with the same completeness as in the two instances which I have set out in detail.

INSTRUCTION—SECULAR. *Arithmetic.*

296. II. I pass to schools having a class in the Fourth Reading Book, though not one in Fifth. I saw many more such schools than are set out in the following list, but many of them had such a very small fourth class—often consisting of one boy or girl only—that I have not attempted to form any estimate of them, under this head.

297. The test I used for the fourth class was not always the same; but usually it consisted of a sum in the simple rules (generally addition or subtraction) two sums in the compound rules (generally addition or subtraction, and multiplication) and a sum in proportion. Sometimes I only gave three questions, and sometimes I gave five. All the schools in the following table were tested in simple and compound rules and proportion, with the exception of the class at the Crumlin-road Convent, which had no proportion, but a somewhat more difficult series in the simple and compound rules. As nearly as possible the test for all these schools, with that reservation, was the same, the sums being of equal difficulty, and differing only in detail.

298. To facilitate comparison, I include in the list the names of some schools not under the National Board, which came into the competition; their classes are not always termed the fourth, but, as with the National schools, the class referred to is the highest in each school, whatever its title. Of course I only applied this test to schools which professed to be able to meet it.

299. Schools not under the National Board are printed in italics, and the whole are grouped according to three degrees of excellence; but in regard to this grouping it must be borne in mind that the average age of the class is an important element, and that the groups are arranged with reference to the per-centage of sums actually done, irrespectively of age.

Specimens of work done in arithmetic in National and other schools in Fourth Book or highest classes.

* Including infants. † Highest draft of Fourth Class acting as unpaid monitresses.

300. The following six schools were submitted to tests differing from the last chiefly in the omission of a sum in the simple rules, and as the sums set were otherwise different in each case, I append to each the rules to which reference was made. The individual importance of the schools is my reason for introducing them separately.

HIGHEST CLASSES (in National Schools, Fourth Book).

SCHOOL.	Sex.	Number present.	Number in Class.	Average Age of Class.	Per-centage of sums done.	Per-centage of Children obtaining more than half marks.	Test employed.
1. Belfast, *Barrack-street (Christian Brothers)*,	Boys.	339	13*	13	69·2†	61·5†	Compound Proportion, Practice, Vulgar Fractions.
Do. *Donegall-street (Christian Brothers)*,	Boys.	513	11*	13¼	81·8	81·8	Compound rules, Reduction, Simple Proportion.
Donaghadee (Hunter's-lane),	Girls.	61	8	12¼	81·2	87·5	
Comber, No. 2,	Both.	104	13	11½	73·0	84·6	Compound rules, Simple Proportion, Vulgar Fractions.
Whitehouse,	Both.	–	10	14⅜	78·7	90·0	Compound rules, Reduction, Vulgar Fractions.
2. Belfast, Hamilton-street Convent,	Girls.	333‡	10	13¼	55·0	40·0	Compound rules, Reduction.
3. Armagh Convent,	Girls.	202‡	12	12½	42·7	33·3	Simple and Compound rules.

* Highest draft from highest class in the School.
† The test in this case was more severe than in others. The boys could do quite as well as, or even better than, those at Donegall-street, on an equal test.
‡ Including infants.

301. The work in the schools placed in the first group of each of these two tables is far superior to that of the average National school. To have a fourth class at all is something to a school's credit. Most of the Belfast schools that I examined either had no such class, or an exceedingly small one. For instance, May-street school, with 132 present, Trinity-street (boys) with 75 present, Old Lodge-road, both boys and girls, with 82 boys and 82 girls present, Bridge-end (girls) with 85 present, and all the six Factory schools in Belfast, had no fourth class at all. At St. George's National school three were in the Fourth Book, and at Earl-street, two in the boys' and two in the girls' school. I am not aware that these are other than fair representative schools in Belfast.

302. III. For the third class in National schools my test varied in different schools, but took one of three forms :—

(*a.*) Simple and compound rules, and simple proportion.
(*b.*) Simple and compound rules only.
(*c.*) Simple rules only.

303. (*a.*) The following list contains representatives in three degrees of excellence, where the test employed included simple proportion. It contains none of the worst schools, for they would not be able to meet such a test at all.

Specimens of work done in arithmetic in Third Book classes in National schools and elsewhere.

IN NATIONAL SCHOOLS, THIRD BOOK CLASS.

TEST :—*Sums in Simple and Compound Rules, and Simple Proportion.*

SCHOOL.	County, &c.	Sex.	Number present.	Number in Class.	Average Age.	Per-centage of Sums done.	Per-centage of Scholars obtaining more than half marks.
1. Aghacommon,	Armagh.	Boys.	66	10	11¼	82·2	80·0
Dundonald,	Down.	Girls.	40	9	10¾	76·3	76·3
Linenhall-street,	Belfast.	Boys.	145	17*	10⅝	76·8	88·2
Randalstown,	Antrim.	Both.	87	9	11⅞	72·2	77·7
2. Glastrey,	Down.	Both.	68	12	12½	68·7	75·5
Maghery Kilcranny,	Armagh.	Both.	35	7	13	64·2	57·1
Trinity-street,	Belfast.	Boys.	75	10	12½	66·2	70·0
3. *Carrickfergus (Church School)*,	Antrim.	Both.	69	15	11½	45·8	40·0
Madden,	Armagh.	Both.	66	8	11½	43·7	37·7
Tullymore,	,,	Both.	49	4	10⅝	29·1	None.

* This is the highest draft only of the Third Book class.

With the exception of Linenhall-street school, the highest class in each school is included in the above.

304. (*b.*) Far more often I confined myself to simple and compound rules. I give samples of different qualities as before.

IN NATIONAL SCHOOLS, THIRD BOOK CLASS.

TEST :—*Sums in Simple and Compound Rules.*

SCHOOL.	County, &c.	Sex.	Number present.	Number in Class.	Average Age.	Per-centage of Sums done.	Per-centage of Scholars obtaining more than half marks.
1. *Bangor (Lodge School)*,	Down.	Girls.	75	10	12½	62·0	70·0
Barrack-street (Christian Brothers'),	Belfast.	Boys.	339	10*	9½	68·7	80·0

Lurgan Convent,	,,	Girls.	186	12	11½	36·1	33·3
May-street,	Belfast.	Boys.	132	10‖	11½	33·3	33·3
Winetavern-street (Factory School),	,,	Both.	93	10	10⅞	26·6	None.

* Lower draft from highest room. † Second highest draft of Third Book Class. ‡ Class next below the highest in the School.
§ Two children above these formed a Fourth Class. ‖ Lower draft of Third class. No Fourth Class.

At Edenderry (Portadown), Kircubbin, the convent schools, and the two schools of the Christian Brothers, there is a fourth class above the class referred to in this table. At the other National schools, and at Bangor Parochial, Ballywalter, and Derryadd, the highest class in the school is referred to.

305. (*c.*) In a few instances, especially where the third class was very young or backward, I gave questions in the simple rules only. This was more frequently necessary with girls than with boys.

IN NATIONAL SCHOOLS, THIRD BOOK CLASS.

TEST :—*Sums in Simple Rules only.*

SCHOOL.	County, &c.	Sex.	Number present.	Number in Class.	Average Age.	Per-centage of Sums done.	Per-centage of Scholars obtaining more than half marks.
1. Campbell's-row (Factory School),	Belfast.	Both.	137	19*	11½	67·1	63·1
Crumlin-road Convent,	,,	Girls.	457	19*	10¼	67·1	63·1
Donaghadee (Hunter's-lane),	Down.	Girls.	61	12	11½	62·5	50·0
Lurgan Free School,	Armagh.	Girls.	106	14	9⅞	57·1	60·0
2. *Armagh Mall School*,	,,	Girls.	48	8	10¾	35·4	37·5
Ballywilly,	,,	Both.	81	12	9⅞	34·3	33·3
Bridge-end (Ballymacarrett),	Belfast.	Girls.	85	8	9⅞	35·4	12·5
3. Armagh Convent,	Armagh.	Girls.	202	12	12¼	27·0	8·3

* Lower half of Third Book class.

At Lurgan Free School, which is under the Board of Erasmus Smith's Charity, the Armagh Mall Girls' School, and the Bridge-end National School the class referred to in this table is the highest in each school.

INSTRUCTION—SECULAR. *Arithmetic.*

306. IV. I conclude this analysis by specimens of three qualities of work in the second class at National schools.

Specimens of work done in arithmetic in Second Book classes in National schools and elsewhere.

IN NATIONAL SCHOOLS, SECOND BOOK CLASS.

TEST :—*Easy Sums in Simple Rules only.*

SCHOOL.	County, &c.	Sex.	Number present.	Number in Class.	Average Age.	Per-centage of Sums done.	Per-centage of Scholars obtaining more than half marks.
1. Aghacommon,	Armagh.	Boys.	66	12	9¼	73·6	83·3
Kilmore (Erasmus Smith's),	,,	Girls.	76	12	8¼	76·3	91·6
Wolfhill Mill (Factory School),	Antrim.	Both.	195	16	10⅛	81·2	87·5
2. Crumlin-road Convent,	Belfast.	Girls.	457	38	9	57·7	47·3

Newtownards (Erasmus Smith's),	,,	Girls.	129	18*	10¼	25·0	11·1

* Highest class in the school. † Highest in the school, except two boys more advanced. ‡ Highest in the school, except three children more advanced.

307. Such work as I record in group (1) is exceedingly rare in the second class : the average National school is represented by groups (2) and (3), but not a few rise no higher than the standard of group (4).

Notation.

308. Notation is usually well attended to in National schools ; in all but the best Church schools it is a very weak point indeed.

Conclusions on this subject.

309. On a general survey of the arithmetic I should say—

1. That the most advanced work is found in the best ordinary National schools, and in the schools of the Christian Brothers in Belfast.
2. That in the highest classes of these schools the more ordinary operations of arithmetic are well mastered.
3. That in a very large number of schools—National as well as other—the arithmetic does not extend beyond the simple and compound rules.
4. That in the average class of schools the children rarely succeed in doing more than 60 per cent. of easy examples within the range of their knowledge, and still less frequently do more than half of the children succeed in more than half the sums.
5. That in many National schools and in most Church schools the standard just mentioned is not nearly reached.

Other Subjects.

English grammar in National schools.

310. Of the remaining subjects of instruction the most important is English grammar. In most of the better National schools, grammar is cultivated with considerable success in the Fourth Book classes, and I do not know that any portion of the work in a good school appeared to me more perfect than this. One has only to start the class in a passage, and they will parse word after word with much rapidity and correctness, giving the part of speech to which each word belongs, with the definition, its gender, number, case, or tense and mood, as the case may be, and its relation to words with which it may be connected in the sentence. When a boy has once advanced to this point, at which he readily recognises at sight the character of any word presented to him, the rest follows very easily, and the whole exercise becomes not very much more than a mechanical process. Still the point at which he has arrived is one which cannot be reached unless a genuine power of independent discrimination has been developed in his mind ; for I am inclined to think, that no portion of his education is in its earliest rudiments so little subject to cut and dried rules as this. No doubt, the earliest operations in arithmetic furnish material for plenty of mental exercise, beyond the mere performance of what is prescribed by the rule ; but the exercise is too difficult to be entered on at the time the rule is learnt, and not being mastered then, is apt to be postponed for good. Very few children, for instance, even when fairly well advanced in arithmetic, can give a rational explanation of the process called "borrowing" and "carrying one" in subtraction ; and for this reason, that at the time the rule of subtraction is learnt, this process is explained, not by reference to the decimal scale of notation (which is too difficult a subject to enter upon), but by an appeal to a well-known and wholesome maxim of social and commercial life, that it behoves you to "pay back what you have borrowed." It is long before a child learns that this fundamental law, as he regards it, of subtraction is but a useful fiction employed to disguise, and not to remove, a difficulty. In this way it comes to pass, that a great many sums are worked out with the utmost correctness, by a process almost entirely mechanical—the rule being committed to memory, the feat is achieved. But this is not possible in grammar, especially in English grammar, where the mere form of a word will rarely show whether it be a noun, adjective, or verb. A distinct mental process is required every time a sentence is parsed, to determine whether or not a word expresses the action or doing of something, or is the name of a person, place, or thing, or an attribute of a person, place, or thing. By long familiarity, the process becomes certainly extremely easy, and so the best boys at the best schools find it ; but the intermediate stages by which that facility has been reached, have probably exercised their faculties more than anything else they did in their lives, until they reached simple proportion.

Value of grammar as an exercise.

Principles seldom mastered below Fourth Book classes.

311. The difficulties a child has to surmount before acquiring this familiarity with the parts of speech, and with the structure of a simple sentence, are clearly seen in the condition of the Second and Third Book classes. In a few schools, the Third Book classes had already passed through the worst of their troubles, and were able to deal with words and sentences, with some confidence in their powers of discrimination ; but usually the replies showed that as yet all was uncertainty, and a great deal guesswork. Some can repeat definitions by rote, but know nothing of their application ; others by a sort of subtle intuition will almost invariably tell the parts of speech correctly, but can do no more ; in either case the mind is still groping after conceptions, which in the better Fourth Book classes have been permanently appropriated.

In other schools.

312. In no schools that I saw is English grammar so well taught as in the best ordinary National schools. Both the Christian Brothers' schools, and the convent schools, fell short of them in this respect. As regards the other non-National schools—chiefly Church schools—I very rarely met with anything like a satisfactory know-

ledge of grammar in them. Sometimes there is a boy, or perhaps there are two boys, at the top of the school, who know something about it; but otherwise the subject is generally little more than a blank. The only class I met with in a Church school, which was sufficiently numerous to claim credit for its knowledge of grammar, was the head class at Kilmore girls' school. Elsewhere the work was too unequal and partial to deserve commendation, and in some schools there is no attempt made to teach the subject at all. INSTRUCTION—SECULAR.

313. A less satisfactory subject is geography, which does not appear to be taught in a manner calculated to render it valuable, either as an exercise or an acquirement. It is made too much of a show subject, and everything is sacrificed to the success of the display. The map of Ireland is learnt with wearisome minuteness, until a child can rattle off the names of counties and towns, rivers and bays, with the precision of a *memoria technica*, and without a thought of what it all means. A start once made, there is no stopping the recital till the end is reached. "Name the counties in Ulster," the teacher will say: no response, but eager eyes watching the teacher's lips for a start. The teacher slowly begins to pronounce, "D-o-n-e-g," and then follows the torrent of voices, which, catching at the familiar sequence, pour forth the whole series, "Donegal, Londonderry," &c., in an unvarying order, and with a breathless and inconsiderate volubility. They will name you the spots where minute rivers rise, detail the villages through which they flow, and describe the exact part of the coast at which they discharge, all without even an outline map to guide them, and from a pure effort of memory. And yet when one asks them to name the country which lies directly to the north of England, or to say in what quarter of the globe they are living, one is answered by a surprised stare, as though one were entering upon niceties too fine for their intelligence. Of course, the higher classes at the best schools, do far better than this—there one meets sometimes with a respectable knowledge of the outlines of physical geography—the motion of the earth, the meaning of the equator, and of the lines of latitude and longitude; but in the inferior classes, an exact familiarity with minute matters in Irish geography is often combined with almost total ignorance of everything else. In the highest draft but one in May-street National school, Belfast—being part of the Third Book class, in which the average age was eleven and a half years—I could only after some pressing, elicit the name of the capital town of England, and no one knew on what river it stands. In a good many schools I found "London" was strange to children who knew not a few other things. The name was hardly recognised at all at the Huss Church school, in Belfast, but this was scarcely surprising, when the best class (average age ten), could not tell me the name even of the town in which they lived, though the master joined with me in endeavouring to extract a reply to the question. This failure to put their knowledge to the simplest test of experience, shows how little intelligence is brought to bear upon the geography lesson. After the names of provinces and counties in Ireland had been promptly detailed, the reception accorded to such a question as "Which of these provinces are we in now?" or, if we were in the county Antrim, "What county is that which you see on the other side of the lough?" proved the perfect hollowness of what had been learnt. Geography.

314. At some schools of the higher class a little is done in the way of mathematics. At the Christian Brothers' schools, in Barrack-street, Belfast, and Armagh, Euclid and algebra are taught to the highest class, and the same is done at Linenhall-street and Townsend-street National schools in Belfast. I also occasionally found a boy or two in a country National school who was beginning algebra, but I have not seen enough of this to justify me in passing any general judgment. I would rather put it negatively, and say that nothing that I saw led me to think that any valuable results are being produced. Definitions in geometry were given satisfactorily both at Barrack-street and at Linenhall-street schools, but in neither case was a proposition proved in a manner indicating a clear apprehension of Euclid's method. The algebra at Linenhall-street, which was the highest development of the subject I saw in National schools, may be estimated when I say that one boy only succeeded in multiplying $(a+b)$ by $(a-b)$, and that though the boys were practising simple equations, they had not yet heard of brackets. Mathematics.

315. Music is a subject in which the convent schools have the pre-eminence. The nuns take much pains to train the upper children in part singing, and for this purpose at both the Belfast convent schools a professional teacher is hired. The monitresses especially receive lessons with a view to qualifying themselves as teachers in afterlife; and with the support of a chorus of younger children, chosen from the rest for their ears and voices, they perform very effectively and correctly. Solos, duets, and glees are all within their powers. A good many girls at these schools learn to play the piano; at Hamilton-street Convent there are about a score who do so, besides the monitresses, and they pay 10*s.* a quarter for it. Music.

316. In ordinary National schools singing is practised, but is not cultivated in so scientific a manner as at the convent schools. There is generally no attempt at part singing; though in some schools where a premium is obtained from the Board the children sing catches. I cannot say that the effect produced by a hundred or more boys in a room with scanty cubical space for the diffusion of sound, all venting their spirits at the utmost strain of their voices, is very enjoyable to the listener. Girls, besides having voices less harsh and unmelodious than the boys, are less apt to revel in the mere delight of making a noise, and their singing is therefore always kept within moderate bounds of exertion. In the ample rooms of the Belfast Model School the singing, both of boys and girls, was decidedly pleasing. It is not reasonable to expect all National teachers to have a taste for music, nor can they spend much time on the subject, even if they have a taste; but the music could be made much more useful if the children were taught by it a lesson of self-restraint and subordination, and if instead of being made a mere physical exercise it were treated rather as an accomplishment requiring some delicacy and care in its cultivation. The older children might take a hint in this respect from some of the infant schools, in which much more nicety is displayed. Singing.

317. In the work of the National schools, which I thus endeavoured to pass in review, there is not a little that is satisfactory, and much that is to be lamented. It is well that the system insures at least a certain minimum of efficiency; that, bad as many National schools are, there is a depth below them reached by some of the Church schools, which I will now proceed to notice, to which it is impossible for a National school, with its inspection, to descend. It is well that every child has this at least brought within easy reach of its door. But on the other hand it is deplorable that so complete a system should permit within its range the existence of many schools which fall so very far short of the standard which is proved by experience to be easily attainable. The child that is sent forth into the world from the fourth class of one of the best schools can never in a lifetime relapse into an ignorant man or woman. To carry education to this point, at which it becomes a permanent and fructifying acquisition, is what these best schools do, and what the inferior schools fail to do. If every school in Belfast were as Linenhall-street and Townsend-street schools are; if every school in the smaller towns were as Edenderry school at Portadown, and Watson's-lane (boys') school at Lurgan; if every large village had a school such as Comber and Donaghadee (Hunter's-lane) possess, and every roadside country school were like South Taylorstown or Aghacommon, I venture to think this district of Ireland would present a spectacle which the people might well be proud of. If all the schools were no better than a great many that I might name, it would be a disgrace to a civilized State to acknowledge them for its own. General review of state of secular instruction in National schools.

Certain Church Schools.

Section VI.—Certain Church Schools.

318. Although I have introduced a mention of the Church schools under different heads in the foregoing remarks on the state of secular instruction in primary schools, there is one class of Church schools which has not entered into the discussion at all, because they afford no grounds for comparison. I propose to notice specimens of this kind in the form of a separate account extracted from my notes of visits to each particular school, as their phenomena are scarcely of a kind to be grouped together. How many more such schools there may be I cannot say; but taking the Church schools of all kinds as they came, nearly one-fourth part of those I saw are the subjects of the following notices.

319. It will be seen that it would have been vain to attempt to tabulate the results of my examinations, so as to bring these schools into competition with those of which I have already spoken. They belong to a distinct order, and must be treated accordingly.

Eglish Church school.

320. *Eglish Church School.*—A large room with mud floor, not half covered with desks, adjoining a house which is the master's residence, and which he occupies, together with six acres of land, rent free; the two are valued at £7 or £8 a year. I found the master in his house, the entrance to which is on the opposite side of the building from the school door. To pass from his house to the school he has to walk round three sides of his house. He emerged from his cottage on seeing me drive up, and went round with me to the school, where the children had been left quite alone. He was followed by a large dog, which entered the school as a matter of course, and lay down to sleep there. The master, a hale old man, has been forty-three years here, having succeeded his father who held the post for thirty-seven years before him; together they have kept the school for eighty years.

321. His roll book gives 27 names, last quarter the number was 48, but potato digging having commenced, he has started a new roll entirely. Present, 9 boys and 4 girls, of whom 6 are Roman Catholics. Of the 13, 10 are either learning their letters, or are in the National Society's First Reading Book. Some of them could just make out a few monosyllables at passages where the master put them on; some could not do this. Among the most ignorant were a girl of eleven years, and a boy of twelve, who were learning their letters only. The rest of this class were from five to nine years old. The three other children formed the second class, namely, (1.) A boy aged twelve, who did four sums quickly and right (simple subtraction, multiplication, and division, and compound addition), and who wrote his name and school on a slate, fairly well, (2.) A boy aged seven, who tried the simplest addition and subtraction sums in vain, and wrote his name in large misshapen letters, (3.) A girl aged seven, who could make nothing of any sum, and wrote her name just legibly. There are no copy-books in the school at all, either of children present or absent.

322. In 1866, the report of the Church Education Society's Inspector, which I saw, was very favourable; the word "excellent" appeared under several heads.

323. No payment of any kind is exacted from the children. The master in his return to my circular, which he signs as an "Episcopelian" (*sic*), gives his whole remuneration, besides house and land, at £14 a year, provided from local sources.

Ballywalter Church school.

324. *Ballywalter Church School.*—School held in a private house, occupied by the mistress, her sister (if I recollect right), and her niece. They keep a small farm, and on my arrival at midday, I found the labourers they employ eating their dinner in the kitchen; the men get 1*s.* 6*d.* a day besides all their meals, a boy gets 15*s.* a quarter and his meals. Out of the kitchen rises a steep ladder staircase, which conducts into the mistress's bed-room; through the bed-room lies the way into a cramped little garret, which is the school-room. The dimensions of this room as nearly as I could ascertain them were 15 feet by 13½ feet for area, and the height at the middle of the room 8 feet, formed by 4 feet of vertical wall and 4 feet of sloping roof. The area would contain, say, 200 square feet, and the whole cubical content would be about 1,200 feet, which at the rate of 80 cubic feet per head, and with proper means of ventilation, would suffice for 15 children. The means of ventilation are the door which connects the room with the mistress's bed-room, one very small window capable of being opened, and a fireplace. The room is partly lighted by means of a slit some five or six inches wide in the roof, covered in with glass, but this is fixed. Overhead are the rafters, whitewashed. Along one side of the apartment, close against the wall, is a desk, the heads of the children sitting at it are almost in the roof, which at that part is only a little more than four feet high; on the other side a long form. Seven small old maps are hanging on the walls, of which two are just decipherable on near inspection, the rest are merely one dull smudge, perfectly useless. The whole of the apparatus, small enough in quantity, is very ancient, the reading books are all in tatters. "A new stock is to be ordered directly," I was told.

325. The mistress has been teaching here for more than thirty years; she began with a private school, which was patronized by the Hibernian Society. Her old registers extend back to the year 1838, the first entry having reference to an inspection in the month of April of that year; she was afterwards taken into connexion with the Church Education Society, and is now in receipt of £4 a year from them. She has had, she says, as many as 100 children present in earlier times. She is now assisted in teaching by her niece, sixteen years old.

326. On the roll are 162 names, including all who have attended at all during the current year; some are now gone for good, and if the roll were corrected to the present time it would contain, the mistress guesses, about 140 names, but she could not say very positively. Present to-day (in a room fit for 15 children), 50 girls and 2 boys. Of these 5 were Roman Catholics, and of the rest about three-fourths were Presbyterians, and one-fourth of the Established Church. They form three classes; the lowest, consisting of 35 children, mostly young and learning only the first rudiments of reading, I dismissed, in order to relieve the atmosphere of the room. The remainder were exceedingly timid, and their reading was often almost inaudible. Fifteen of them were in the second class, and the remaining 2 formed the third class. The ages of the children in the second class were from 6½ to 12 years; the average age was just over 9 years. The mistress said they were reading the Third Book of the National series; in this I should have passed 5 out of the 15, though most of the reading was in so low a tone that it was hard to follow it. I then tried arithmetic. Only 6 out of the 15 do sums at all. I gave them a very simple addition sum consistng of three rows of figures with three figures in each line. They were all quite wrong, and only after repeated attempts did two (boys) get it right, and they were standing close to the mistress. Having my doubts about even these two results, I gave a second sum of two rows of figures only, with three figures in each row—perhaps as easy a sum as it is possible to give. No one of them had the least idea of doing it; indeed they could not even set down the figures correctly. Their copybooks were slovenly throughout.

327. The highest class contained 2 girls, aged 15 and 13, respectively, and with them I examined the assistant teacher. In reading the National Third Book, the assistant did well enough, the other two just passably. The writing of the assistant was good; of the other two poor. In arithmetic the mistress said they were in the compound rules. I tried them with a simple addition sum of four rows of figures; only the assistant had any idea of notation; the other two could not write down 605. Only the assistant could do the sum. Next I tried a simple multiplication sum by 8, for the assistant and one of the other two girls; neither could do it, but

eventually the assistant after corrections got it right. To the third girl, aged 15, I gave two rows of figures to be added together. She could not add them at all. I then tried dictation, giving them the following passage, each word of which I repeated over and over again to help them:—"Many learned men of whom I could tell you, have risen from the poorest and most hard-working people, by devoting their spare minutes to education." The assistant misspelt two words. From the girl aged 13 I could scarcely get anything, but eventually she wrote a few words incorrectly. The girl aged 15 wrote thus:—"Many landed men of hom I cood tell you have risen from the porest and most hard working peapol yy devoghting ther spars minets to education." Spelling was not a strong point with the mistress, for in the headings which she writes for copies, I counted on a cursory glance seven words misspelt, *e.g.*, "Gameing ruins, &c.," "Judge not according to apearances." Certain Church Schools.

328. The mistress charges from 1*d.* a week to 3*s.* 6*d.* a quarter, and some who learn fancy needlework pay her as much as 7*s.* a quarter; but none of these were present. She keeps an evening school for 6 grown girls, who pay 2*s.* 2*d.* a quarter each. Altogether she returns her fees for 1867 at £16; this and the £4 from the Church Education Society, form the sole income of the school. The mistress allowed that in hot weather the school-room is unbearable, and she then holds school in a barn, which she showed me, and which is now full of oats and agricultural implements. It would be a rough place, but infinitely preferable to the garret for health's sake. For needlework, which requires a little more space than reading, she uses her bedroom.

329. The rector was present during the examination, but he showed no sign of surprise or dissatisfaction at the performances of the children.

330. There is no National school in Ballywalter, but separate boys' and girls' schools are maintained privately by Mr. Mulholland, in excellent buildings.

331. *Dundonald Church School.*—A good large room; dimensions about 39 × 19 × 13 feet, with 10 parallel desks, which would hold 8 children each easily. Stone floor. House adjoining for the master. All in good general repair. Dundonald Church school.

332. Master is parish clerk, and receives £10 a year from the Ecclesiastical Commissioners. He also receives £19 a year from subscriptions of neighbouring gentlemen, £4 from the Church Education Society, his house rent-free, and anything he can get by fees from the children. On the day of my visit, a Monday, he had taken 2½*d.* from 19 children present. The 19 (13 boys and 6 girls) were an unusually large attendance; the weekly average frequently falls into a single figure, such as 8, which I saw entered in his book; the highest for a long time was 20 for a weekly average. Of the 19, 12 were of the Established Church, 7 Presbyterians. Twelve were in a first class, not yet commencing sums. Three in the second class, aged from 9 to 10 years, read poorly, wrote badly, and did but one sum (in simple addition) among them out of three sums a piece in the simple rules. Four boys in the head class read very fairly, and their writing was tolerable. One of them, aged 12¾, was smart at arithmetic, and succeeded in an easy proportion sum. The other three, tried with four sums in simple and compound rules, did not get one sum right among them. Dictation was fairly well done. The average age in this class was over 11 years.

333. There is a National school in Dundonald, where I found 21 boys and 40 girls present, the girls' room being full. The Church school has by far the best room, and would accommodate 100 children well.

334. *Tullygally Church School.*—A large, rough-looking room, with seven parallel desks, to hold seven or eight children each, and ample other space. Master an odd old man, with apparently no notion of his business. He has been fourteen years here. Has eighty-five children on his roll, of whom five were present at 10.45, A.M.; master sent out to have other children fetched from their homes, and by half-past eleven he had got together sixteen children in all. The master says he has five classes, but he could only make up three on this occasion. The biggest boy "Supposed he might be sixteen years old;" and on my asking him which class he was in, was in much doubt. The master said: "Is it in the second or the third class you are in?" As they could not determine the point, which was not one of the slightest importance under the circumstances, I gave him a simple subtraction sum to do, which proved to be entirely beyond his capabilities, whatever his position in the school might be. The proficiency in the school generally was extremely low. One boy did a simple subtraction sum right, and another—the head boy, eleven and a half years old—though he had no idea of notation, succeeded in doing a sum in compound addition correctly, but failed in subtraction. The rest were learning to read. The two best boys each showed an extremely foul book containing sums written out with pen and ink, to which the master referred me as evidence of what they could do. They consisted of a series of examples worked out in what the master calls the "rule of three direct." I extracted one sample:—"What cost 327 yards of canvas at 8*d.* per yard?" This question was repeated in various forms over and over again, other goods being substituted for canvas, and the length and the price varied; but they were all mere multiplication sums. For copy-books the master produced three separate pages of good writing, which, to judge from the tint of the paper and of the ink, must have been, I should say, some ten years old, and probably more. For keeping this school the master received £8 in 1867 from the Church Education Society, £4 6*s.* 8*d.* from fees, and no other emolument. Tullygally Church school.

335. *Huss Church School, Belfast.*—Even in a great town one may find a Church school, not indeed in so forlorn a condition as that of the school last mentioned, but very little better for any practical purposes. The Huss school occupies a particularly favourable site, having a good piece of grass play-ground, and a school-room 45 feet long and 18 feet broad. I should say that from 100 to 120 children might be well accommodated in it. I found only 51 present, out of 167 on the roll; but the average attendance as shown by the books was 72·6 for May, June, and July, combined. The master is an old man, quite past his work, and apparently partly paralyzed. He expressed a hope that my visit would lead to his superannuation by the Government on a pension. He is assisted by two boys, or monitors, at 5*s.* a quarter. Internally, the school was in a do-nothing condition; externally, the children's offices were gross outrages on decency and the laws of health. Only two boys in the school, aged twelve years each, could do anything beyond an easy sum in the simple rules. The rest of the highest class could just manage a simple addition sum; but all but one failed in subtraction, and all in multiplication. Writing was exceedingly bad; grammar and geography all but unknown. The second class could scarcely do anything. Both their reading and writing were very backward, and the simplest questions on general topics were entirely beyond their comprehension. I tried in vain to ascertain from them in what country they lived, till one adventurous girl told me Africa. Huss Church school, Belfast.

336. It was useless to descend to the class below this. This school was supported in 1867 at a cost of £35, viz., £13 from fees, £8 from the Church Education Society, and £14 from local sources.

Section VII.—Certain Independent Schools.

337. I saw a few schools which are managed independently of any public society, by associations of private individuals. Two of these are called "ragged schools," the one in Barrack-street, Belfast, the other in Newtownards. Both are under Protestant management, and the Bible is freely used in them.

338. The Belfast ragged school is managed and supported by a committee of about forty ladies, all members of Belfast ragged school.

Certain Independent Schools.

the Established Church. The school is in connexion with no society; but the Inspector of the Church Education Society receives a fee from the committee for a half-yearly visit. The intention, however, is declared to be to keep the schools free from a sectarian bias, and for this reason no catechism is used, even for the Church children. No child pays anything at all, and everyone has a meal of bread and milk, or in winter, of soup, daily. This acts as a very strong inducement, and the remarkable result is, that of all the schools in Belfast, not excepting even, as I understand, the model school, this is the most genuinely mixed, as regards the combination of Roman Catholics with Protestants. I omit, of course, factory schools, to which children are sent by an arrangement on the part of their employers *nolente volente ecclesia*. The proportion at the time of my visit was 42 Roman Catholics to 270 Protestants—not indeed a very complete fusion, but noteworthy in the present state of affairs in the Belfast schools. The Bible is read daily, and no differences are allowed on account of diversities in religious creeds, the Roman Catholics reading with the rest. The priests are said not to interfere with the attendance at this school.

339. This unusual mixture of denominations may be explained by the following considerations:—(1). The food daily dispensed offers an inducement which very poor mothers cannot resist, and knowing this the priests may be wise in refraining from putting their authority to so severe a test as would be involved in a prohibition of the school: (2). The object of attack by the Roman Catholic priesthood is the existing National system, especially in the mixed form which prevails theoretically in the model schools. This ragged school is not under the Board, and therefore passes comparatively unmolested. As the school stands, Roman Catholic children attending it read the Bible and are open to direct Protestant influences, and yet their attendance is permitted. Whereas if the school were placed in connexion with the National Board, the Roman Catholic children would be carefully protected against all chances of proselytism, and yet would be forthwith withdrawn from the school by outside influences. (3). These children are not under inducements to attend the Christian Brothers' schools. One of their schools is in this very Barrack-street, close to the ragged school; but the aim of the Christian Brothers' schools is not to gather in the hungry, half-clad Arabs of the street, who are attracted by the bread and milk of the ragged school; they aim at a more respectable class—the class that attends the model schools—and these poorest of the poor find the Christian Brothers' schools filled with the children of their betters. Thus their very poverty leaves them more free to act than they would be if they were anything better than a penniless residuum.

340. The cost of this school in 1867 was £464 18*s.* 7½*d.*; this sum includes salaries of master, mistress, infant-mistress, and two assistants, bread, milk, soup, rent (£40), and various other outgoings. The funds, which are in a flourishing state, are raised by means of collections, and especially a bazaar, which is resorted to every few years when money is wanted, and which in 1867 produced a net profit of £550 4*s.* 6*d.*

341. I have only to add that the school appears to be well managed, and it has large, airy rooms of ample dimensions.

Newtownards ragged school.

342. The Newtownards ragged school is of a very humble type. It is held in a cramped, little up-stairs room in an ordinary house, and taught by a widow woman and her boy, thirteen years old, neither of them at all qualified for their duties. The Committee, consisting of Presbyterian clergymen and others, pay 5*s.* a week for the teaching, besides the rent of the house. I found forty-six children present, mostly very young, and the attainments of the most advanced, up to nine and ten years of age, extremely low. The time seemed to be chiefly spent in reading from the New Testament.

Ballywalter—Mr. Mulholland's schools.

343. At Ballywalter separate boys' and girls' schools are maintained by Mr. J. Mulholland and his family. In externals they are very well accommodated, but the teaching power is wholly inadequate in the boys' school, where one unaided master had eighty-two boys present—some of them big boys of fourteen, fifteen, and even sixteen years. The master has a residence rent free, and £30 a year as salary; the mistress a residence, and £20 a year. Besides this, the fees in the boys' school are returned for 1867 at £15, and in the girls' school £5. The class of children is fully as high as that found at ordinary National schools; and if the school were placed under the Board, its usefulness might be largely increased by the addition of assistant teachers.

344. The Bible is read by all the children, including a small admixture of Roman Catholics (nine boys and two girls out of ninety-six boys and forty-four girls on the rolls), but no catechism is said by the Roman Catholics. The master's plan, when hearing catechism, is to let the Church children say their catechism, and the Presbyterians theirs, and when he comes to a Roman Catholic he asks him to say a commandment or the Lord's Prayer instead. In this way he says all goes smoothly, and no complaints are ever made.

345. The standard of attainment was decidedly below that of an average National school, though the average age in the fourth, or highest class, of the boys' school was thirteen and a half years; and in the fourth and fifth classes combined of the girls' school, more than fourteen and a half.

Wesleyan mission school, Derryinver.

346. I also visited a Wesleyan mission school at Derryinver, in the bog country lying to the south of Loch Neagh. It is held in a building used also as a meeting-house, and the master is employed also as an itinerant preacher. He receives a salary of £26 a year, a house and garden rent free, and about £5 a year in fees. His roll contained forty-eight names, of whom eleven were entered as Wesleyans, one a Presbyterian, and thirty-six of the Established Church. There were four sharp boys at the top of the school who did satisfactorily; the rest were very young. The discipline was very loose, and the management generally wanting in method.

These schools generally at a disadvantage, as compared with National schools.

347. In no particular did it appear to me that these independent schools possess any advantage to compensate for the loss they sustain by their isolation from the National system, and they generally labour under the great disadvantage of being under-officered, either in point of the number of teachers, as is notably the case at Ballywalter, or of the qualifications of the teachers, as at Newtownards in particular.

Section VIII.—The Half-Time System in National Schools.

348. In Belfast, and in some villages in the neighbourhood of Belfast, I had the opportunity of observing the National system of education when brought into contact with the Acts of Parliament which regulate the employment of young children in factories.

Regulations of the Factory Acts.

349. The linen trade of Belfast has now grown to proportions so enormous that the operation of the Factory Acts is a matter of the deepest interest to the welfare of the town; and accordingly, in my visits to the National schools there, I paid special attention to those which are engaged in educating children on the half-time system.

350. The regulations affecting the attendance at school of "children," that is of children under thirteen years of age, employed in factories, are briefly as follow:—

1. No child under eight years of age can be employed at all.
2. Children (*i.e.*, under thirteen years of age), cannot be employed for more than six hours and a half on any one day, nor before six, A.M., nor after six, P.M.; nor after two, P.M., on Saturdays.
3. Children cannot be employed both before noon and after one o'clock on the same day.
4. Children must attend school three hours daily, except on Saturdays, and they must be sent to school from their first entrance into the works.

HALF-TIME SYSTEM.

351. These regulations make it necessary for mill-owners to employ two sets of children, if they employ children at all; one set commencing work at six, A.M., and working till dinner time, but not later than one o'clock, and going to school in the afternoon; the other set going to school in the morning, and commencing work after dinner, or not earlier than noon, and working until six, P.M.

Two "sets" of children employed.

352. In lieu of this plan, it is lawful to employ children for ten hours a day on alternate days, in which case the children are required to attend school for five hours a day on the alternate days, but this plan is not acted upon in Belfast.

Alternate plan.

Certificate book of attendance.

353. The onus of seeing that the child attends school for three hours a day is laid in the first instance on the parent, and the employers are required to ascertain every Monday morning that the child has so attended school during the preceding week. For this purpose a "school certificate book" is kept at the works from Monday until Friday; it is then sent to the school to be filled up by the teacher for the week just ended, and is returned by the teacher to the works, so as to be ready for inspection and reference on Monday morning. The employers' responsibility in the matter of school attendance begins at this point, for, if it appears from the certificate book that the child has been irregular in attendance at school during the past week, it cannot be legally employed for the following week.

The Regulations adapted to English,

354. To anyone familiar only with the habits and hours of operatives in England, the half-time system, as sketched in the above regulations, appears simple and easy to work. The working day is divided by the dinner hour into two equal, or nearly equal, parts, and the morning set of half-timers cannot be kept at work after one o'clock, nor the afternoon set commence before twelve o'clock. The dinner is presumed to be eaten somewhere about twelve and one o'clock, and this is the invariable practice in England. In exact harmony with this arrangement, the ordinary school-hours in England are from nine, A.M., to twelve at noon, and from one to four, or two to five, P.M., so that it is perfectly easy for the half-timer, whether in the morning or the afternoon set to get his dinner in the middle of the day, between work and school, and to get his full three hours at school.

But not to Irish habits.

355. But in Ireland the whole system is thrown out of gear by the fact, overlooked apparently by the Legislature when the Act was framed, that the dinner hour is usually about three o'clock, and that, to suit the habits of the people, the school hours are almost invariably from ten, A.M., to three, P.M., with a short interval at half-past twelve or one, P.M., during which the children eat a "piece," which they bring with them, or which, if they live close by, they go home to eat; in either case the dinner comes after school, and is not intermediate. Consequently wherever children are employed in factories in Ireland the problem arises how to adapt to the habits and practice of the Irish a code of regulations framed upon an exclusively English conception of the form which the day's work assumes. Perhaps, in the case of adults this might appear to be a somewhat trivial difficulty; but in dealing with children of tender years, it becomes a question of the highest importance from a sanitary point of view how to minimize the injury to health which must ensue, so long as the nine hours reached by the law have to coincide with a scheme which presupposes a mid-day dinner, when, in point of fact, the dinner is three hours later. With one exception, to which I will refer hereafter, what actually results in Belfast is this. The first set works at the mill from 6, A.M., to 12 or 12.30, and then comes straight from the mill to school, at the most picking up a piece of bread at home on the way; by 12.15 or 12.45, P.M., in theory, this set is in the school-room, and stays there from that time till 3 or past 3 o'clock. In an ordinary National school, this arrival of the afternoon set of half-time scholars occurs just at the time of recreation, and practically school work begins for them, say, at one o'clock, and the amount of schooling actually received is hardly more than two hours. By reckoning the time (which must be a quarter of an hour or more at the least), during which the children are collecting from the mill, and eating their "pieces," and by keeping them in the school-room a quarter of an hour or so after the regular hours, it becomes possible for the teacher to sign the certificate of attendance as required by the Act. But it is evident that this is not the sort of three hours at school which the Act contemplates, and I may say that in most schools the treatment of the afternoon set, even if it is made to comply with the strict letter of the law, is certainly not within the spirit of its enactments.

In effect the afternoon set does not get the due amount of teaching.

Teachers and others not to blame for this.

356. I do not wish to imply that I find any fault either with the managers or teachers of the schools for not keeping the afternoon set of half-timers so long as to give them a full *bonâ fide* three hours schooling; or with the factory Inspectors for not exacting a more rigid adherence to the regulations laid down on this subject. I believe, on the contrary, that the laxity to which I refer is but a merciful interpretration of an Act to which these children are bound to conform, although its frame work is entirely unsuited to their wants; and so long as the regulations remain as they are, I can see no other course to be pursued than that which is now usual in Belfast, namely, to adhere as nearly as may be to the letter of the law, in the hope that modifications may be introduced which will make it easier to comply with the spirit of it. For in the mind of the Legislature, the idea was that a child released from the factory at 12, or at latest, at 1 o'clock, should return to its home, change its dirty clothing, which is only fit for mill-work and most unsuited for school; be washed—for after six hours at a mill, a child is not fit to associate with other people till it has been washed—eat its dinner, and at 1 or 2 o'clock be at the school door. With a clear hour or more between release from work and appearance at school, all this can be easily done. The hour's interval, the change, the wash, the dinner, are of the greatest value, both morally and physically; morally, because the child is taught the duty of cleanliness and order, and is made to understand that the squalor of the mill-worker is proper to the mill only, and is to be put aside before any other duties, and, above all, that of going to school, can be fittingly discharged; physically, because, after six hours' work, with a light breakfast, no child should be kept waiting for its principal meal, least of all should it be required to go through three hours of further occupation first. To the child that gets a mid-day dinner, the afternoon school is a separate occupation for which an integral portion of the day is set apart, and for which it has been prepared and recreated by the interval since the release from work. To the child that waits till past three o'clock for dinner, the afternoon school is but a scrambling sequel to the long morning's work, to which it goes tired, dirty, and unwilling, and from which it's longing to be released is ever quickened by thoughts of the long-deferred meal.

In England a child can come fresh and clean to afternoon school,

in Belfast must needs come tired, dirty, and hungry.

357. I have never had an opportunity of observing the working of the half-time system in England, and I am therefore not in a position to contrast its phenomena under the diverse conditions of the two countries; but concerning Belfast half-time children, and of the effects which this system produces upon them, I can speak from positive observation of every mill-workers' school in the town, and my experience is that with scarcely an exception the afternoon set come to school in a state of personal dirt and squalor, which makes association with them disagreeable and offensive in the extreme. The room is pervaded with the nauseous odour of the oil with which flax is impregnated; the children's faces are smeared with the oil and dust which adheres to their fingers after their work; their scanty ragged clothing, with an old shawl thrown over their shoulders to protect them from the rain, distinguishes them painfully from their companions, who are apt to shun them as an inferior class with which it is not fit for them to associate. And then the wan hungry faces which tell of unnaturally early hours and unnaturally heated rooms, continually remind the teacher that what these children want, what nature would prescribe for them, what the interests of education itself demand for them, is not

HALF-TIME SYSTEM.

to be set down to write words on slates or do sums in their heads, but to be clothed decently, washed clean, and unsparingly fed.

358. Therefore it is that, with the present habits of the people as regards dining and school hours, it is vain to expect the afternoon work of half timers to be advantageously carried on, and managers and teachers may alike be excused if they let the children off as leniently as they can.

Reasons why the system of alternate days at mill and school should not be adopted.

359. The most obvious remedy for this state of things would be to adopt the system of working at the mills and attending school for full time on alternate days. As I have said this plan is never adopted in Belfast, and there is this strong reason why it should not be adopted—namely, that the law forbids the employment of children for more than ten hours in one day, and if children are employed for that length of time the hours of works for young persons working on full time and for women must be restricted to ten hours a day also. The hour of work allowed by the law for those on full time, are ten and a half per diem, excepting Saturdays, so that by adopting the system of work and school on alternate days, the mill-owners would be sacrificing half an hour's work a day. Nor does it appear to me, judging from what I have seen of the half-timers at school, that it would be at all desirable that the plan should be generally adopted. After six hours of work in heated rooms a young girl never fails to show symptoms of overwork and exhaustion. I cannot believe that her frame is capable of bearing a more prolonged strain without certain ruin to the healthy development both of mind and body.

Schools should be specially adapted to wants of half-timers.

360. To my mind it is clear that the education of half-timers in Belfast can only be carried on satisfactorily in schools specially and exclusively arranged with a view to meeting their wants; and to secure this end the factory schools should arrange their day's work according to the English plan. They should have three hours schooling before mid-day, an interval of at least one hour at mid-day, and three hours schooling in the afternoon. I am aware that many teachers would not like this; they are in the habit of getting their day's work over early in the afternoon, and so having an easy time for and after dinner; but this is a trifling difficulty, and, in view of the interests involved, absolutely insignificant. The real objection which may be urged against this plan is that it would exclude from factory schools all except factory children, and that if the arrangements were made suitable to the exigencies of the half-timers, it would often be of advantage to them to be associated with children who attend school for the whole day; they would lose the stimulus of emulation which the presence of the ordinary scholars might be expected to afford. My own observations do not suffer me to attach much weight to this argument. In one or two particularly favourable instances, where ordinary day scholars and half-timers were indiscriminately mixed in class, it was evidently a matter of pride with a smart half-timer to keep pace with the rest, and a spirit of competition was evidently at work. But usually the advantages enjoyed by the ordinary pay scholar are too great for the half-timer to overcome, and whatever of competition there may be, takes place between children presenting a great disparity in age, and this is humiliating and not stimulating to the older and more backward child. With an improved arrangement for the half-timers the disparity might, it is to be hoped, be greatly reduced, but the main chance of this improvement lies in adapting the mill schools to the wants of the mill children, and if this should entail a separation from other scholars, that is a consequence of entirely secondary moment.

Difficulties referred to have greatly impeded spread of half-time system in Belfast;

361. The effect of these difficulties in working the educational clauses of the Factory Acts in Belfast has been greatly to impede the spread of the half-time system there. Mr. Baker, one of Her Majesty's Inspectors of Factories, in his report for the half year ending October 31, 1866, draws attention to the fact that there were then "only about 270 half-timers in the whole of the Belfast mills, when from the same amount of machinery in England as many children as these would be at school from two or three mills alone." A similar difficulty has been experienced in the working of the educational clauses in Scotland, where also the usual dinner-hour is from 2 to 3 o'clock, and where the schools are accordingly open from 9, A.M., to 2, P.M. The consequence, as reported by Mr. Redgrave in 1862, was that the half-timers in Scotland were but 1·8 per cent. of the whole number of persons employed in factories, while in England the per-centage was 9·6.

but system now extending itself rapidly.

362. Still the half-time system is now making rapid progress in Belfast, and the question how to adapt the practice of the National school to the requirements of the Factory Acts is one of growing importance. A return, for which I am indebted to Mr. Cramp, the Sub-Inspector of Factories for the North of Ireland, containing the results of his most recent information up to the summer of 1868, gives the number of half-timers employed in the mills of Belfast proper at 464, besides 185 in the mills at Ligoniel, about three miles from Belfast, and 172 at Whitehouse and Whiteabbey, some five or six miles from Belfast. These are exclusive of children employed in printworks, to whose case I will refer separately. My own investigations in summer and autumn of 1868 disclose a further large increase. There are six schools in Belfast proper which are attended by half-timers from the mills, and each of these I visited and inspected. I found on the rolls of these schools the names of 44 boys and 637 girls working half-time at the mills. I also received a return of four half-timers in attendance at Beersbridge National school in Ballymacarrett, which I did not visit. Altogether, therefore, there were 685 half-timers on the rolls of the Belfast schools. This number is somewhat larger than the number actually employed in the mills at any one time, as it would include all temporary absentees. The number in actual attendance at the periods of my visits, including both morning and afternoon sets, was about 560. On the lowest estimate, therefore, the half-timers in Belfast have more than doubled in number since the period referred to in Mr. Baker's report, that is, in about two years; and Mr. Cramp, the local Sub-Inspector, informs me that they are daily increasing. Some idea of the possible expansion which may take place in the future may be formed from the fact that the present half-timers belong to ten mills only, while the total number of mills in the town is 52, employing 27,000 hands, and if the proportion of half-timers to the whole number of millworkers should become the same in Belfast as it is in England, there would be about 2,600 half-timers in Belfast proper.

Extent of possible further expansion.

Factory schools under-officered.

363. With regard to the internal working of the factory schools in Belfast, they are under the special disadvantage of being under-officered. The proportion of teachers to children is quite inadequate to the effective conduct of the schools. The reason of this is, that the National Board, in estimating the average attendance on which the allowance of State assistance is to be calculated, halves the total number of half-timers in attendance, on the theory that two half-timers are equivalent only to one child who attends for the whole day. This theory is obviously false. It would not indeed be reasonable to treat each half-timer as a whole timer in the calculation; but in avoiding that objection, the Board has gone to the other extreme, and makes no allowance for the extra trouble which the division of time between two different children really entails. There are twice as many individual cases to be attended to, twice as many separate characters and interests to be regarded, twice as many entries to be made in the register and roll book, the proper keeping of which forms no insignificant portion of the teacher's occupation; and what is of still greater importance, the arrangement of the day's work becomes complex instead of simple. Instead of five continuous hours which may be distributed in such a manner as to cover all the subjects of instruction prescribed by the programme laid down by the National Board, the teacher has two periods of about two and a half hours each, which are to be each of them complete in themselves; he has to carry one set of children through their

whole course in the morning, and another set in the same way in the afternoon, so that the same ground has to be traversed twice in the day and at double speed. If, as is usually the case, there is a body of ordinary paying scholars besides the half-timers the result is that two schools are carried on side by side, the one spreading its subjects over five hours, and the other crowding its subjects into two or three hours. The powers of the teachers are thus taxed beyond their ability and their attention distracted by the necessity of seeing to two things at the same time. HALF-TIME SYSTEM.

364. The inadequacy of the teaching power was most noticeable in the case of the Pilot-street girls' school. I found in attendance there on the day of my visit forty-seven ordinary scholars and ninety half-timers, about half of whom were present in the morning and the rest in the afternoon, that is to say, there were 137 individual children to be attended to, and about 92 present at any one time. The ordinary scholars and half-timers were kept entirely separate, so that practically there were two schools of forty-five to fifty children in each, and each subdivided according to the proficiency of the children in it. The ordinary scholars were reading, some of them on the card, some in First, some in Second, and some in Third Book; the mill girls were some of them just learning their letters, some in First, and some in Second Book. For all this work the staff consisted of two female teachers. When it is remembered that the income of the teacher depends partly upon the variable fees of the ordinary scholars, whereas the owners of the mill pay for the half-timers at a fixed rate, it cannot be matter of surprise if, as it is impossible to attend to all the children properly, the best of the attention is devoted to the ordinary paying scholars. Certainly the ignorance of the mill girls was lamentable, though as they had only attended here for some three months this school is but slightly responsible for the result. Probably the number of children in attendance will in due course secure for this school an increase in the teaching staff. But meanwhile the state in which I found it is not uninstructive. The pay scholars in the Second and Third Books were of the average age of nearly nine and a half years, and for their years they were in a tolerably forward state. The mill girls in the Second Book averaged eleven and a half years of age, and in a class of the eleven highest girls three only could read at all passably, and two only could write legibly on a slate; none of them had ever attempted to write on paper. The girls below them averaged more than eleven years of age, and they were in almost total ignorance. Some could slowly decipher words of four or five letters on the card, others were learning their letters only. One girl of thirteen years of age, and therefore on the point of developing from a half-timer into a full-timer at the mill, with her education completed as far as it ever would be completed, could do absolutely nothing. She could not read a word; and yet she was a fine girl, with a countenance clearly indicative of natural intelligence and vivacity. She had never gone to school except as a half-timer, and the little teaching she had received had failed to produce any discernible impression on her mind. Instances:—Pilot-street school.

365. For the instruction of these mill-girls, of whom the school-roll contained 131, and of whom I found 90 in actual attendance, the mill pays £15 a year. This is a contract price, for which the mistress undertakes to give schooling according to the requirements of the Act to any number of children whom the managers of the mill may send. The mill belongs to the York-street Flax Spinning Company, and is, I believe, the largest in Belfast.

366. I append two extracts from my records of the examination of this school:—

Draft of 11 Half-time Girls, reading Second Book, *being the most advanced class of half-timers present.* Specimen of work done by highest class of half-timers.

No.	Age.	Reading in Second Book.	Writing on Slate.	Specimen versions of a passage dictated from Page 30 of the Second Book: "An old man and his son were driving an ass to the market to sell."
1	11	Very bad.	Bad.	An old mon and his son wher drivng ass to the marjet to sell.
2	12	Bad.	Bad.	An old man and his soon were driven A an ass two the market two the market two sell.
3	12¼	Passable.	Fair.	(Not copied.)
4	11	Bad.	Bad.	
5	11½	Passable.	Very bad.	
6	11	Bad.	Passable.	
7	12¼	Very bad.	Bad.	An old man and his son wer a old ass to marks sell.
8	10	Very bad.	Very bad.	A nald man wer deeising an ass to ise mar.
9	10¾	Fair.	Bad.	(Not copied.)
10	11½	Very bad.	Bad.	
11	13	Bad.	Very bad.	An old man and his son wer a old ass to marks sell.

367. The exercises which I did not copy out were perhaps slightly better than those which I give above. The passage was dictated very slowly; it comprises the opening words of an early lesson in the Second Book, which the children soon knew almost by heart.

368. At the bottom of the school I obtained the following results from a class of 12 mill-girls. The questions to which replies were most easily elicited had reference to the pay they received from the mill. I accordingly add what the girls told me on this point:— By lowest class.

No.	Age.	Reading Monosyllables on the Card.	Writing.	Whether at any School previously.	Earnings last Fortnight.
					s. d.
1	13	Nil.	They could not write at all.	No.	3 11
2	10	Almost nil.		Yes.	2 4
3	11	A very little.		No.	(Just entered.)
4	9	Letters only.		No.	3 0
5	11	A little.		No.	3 11
6	11½	Letters only.		No.	2 2
7	10	Just passable.		Yes.	3 0
8	12	A very little.		No.	4 2
9	12¼	Almost nil.		Yes.	3 6
10	12¼	A very little.		Yes.	3 2
11	10½	Letters only.		Yes.	3 1
12	11	A very little.		Yes.	2 5

HALF-TIME SYSTEM.

369. Those who had attended no school previously to the employment at the mill had in fact received only a few weeks' instruction. But those who had been to school before were hardly any the better for it. I give the list not so much in condemnation of this particular school, which has had these children for a short time only, but to show what is the mental condition of hundreds of girls in Belfast, of whom only a small proportion receive even the meagre education imposed on such as enter the mills on half-time.

Such is the mental condition of hundreds of girls in Belfast.

370. As will be observed, their earnings are on an average about 1*s.* 8*d.* a week, or 3½*d.* a day, or slightly over ½*d.* an hour.

Winetavern-street school.

371. At another mill school, known as Winetavern-street National school, where the attendance is about equal in number to that at the Pilot-street school, I found a different plan of operation. The management of the school is in the hands of the manager of the mill (Mr. Herdman) to which the school belongs, so that the half-timers are the groundwork of the school, to whom pay scholars are superadded; whereas the Pilot-street school is an independent National school, with which the York-street mill has made a contract for the teaching of its half-timers. The pay-scholars at the Winetavern-street school are really candidates for admission to Mr. Herdman's mill—children as poor as the half-timers, and with no unwillingness to associate and be classed with them. There were 93 half-timers present in the two sets, and 45 other children, paying nominally 1*d.* a week, though only about half of them actually pay the money.

372. The teaching staff here is stronger by one than that at Pilot-street; it consists of a mistress and two third-class assistants. The mill pays £30 a year to the teachers—just double that paid by the York-street mill, though the number of half-timers in attendance was about the same in either case. Besides this, Mr. Herdman supplies firing in winter, and keeps the building, which is his own property, in repair. But notwithstanding this comparatively liberal treatment, and the fact that the school is intended primarily for the accommodation of the half-timers, and not of the paying scholars, the effect produced is very discouraging, and the standard of acquirement exceedingly low. There was indeed a class which had reached the Third Book and was working in the compound rules of arithmetic, but only half the class, containing eight girls, could do a simple addition sum correctly; two only succeeded in simple short division, and no one in compound multiplication. At the lower end of the school there was no such complete ignorance as at Pilot-street; all but one girl were in the First Reading Book; most could make some decipherable marks on a slate; and about half, in a class of 17, succeeded in adding together two lines of figures, whose sum was 362, correctly. These are indeed no great achievements, but they at least mark the difference between dawning light and utter darkness; and these girls were on an average a year younger than the corresponding set at Pilot-street.

373. The earnings of the children in the two cases were very much the same. Mr. Herdman pays 3½*d.* or 4*d.* a day, according to merit.

Leeson-street school.

374. A somewhat more satisfactory state of things was disclosed at Leeson-street National school, an independent school, to which the Milfort Spinning Company send half-timers. Here again the number of half-timers in attendance is about the same as at Pilot-street and Winetavern-street, the usual number being about 92. For these the mill pays at the rate of 2*d.* a week apiece, or about £36 or £37 a year. The ordinary pay scholars pay 1*d.*, 1½*d.* and 2*d.* a week; and as this is a very variable and precarious source of income, the half-timers are the most remunerative part of the school. We have seen that at Pilot-street there were two female teachers to 131 individual children, of whom 92 were present at one time; at Winetavern-street there were three female teachers for an attendance of 138, of whom 93 were present together. At Leeson-street the average attendance of pay scholars was 60 in the month of July, which, added to the half-timers, gives 152 individual children, of whom I found 103 present at one time. For these the teaching staff consisted of a mistress, three female assistants, and a monitress. The effect was palpable. The half-timers in the Third Book wrote from dictation decently well, one girl making no mistakes, and two making only one each. In compound subtraction and multiplication half the sums done were correct; and I elicited some fairly good answers in English grammar, a subject which in the other two schools was a complete failure. In the second class a good many girls did sums in the simple rules with some smartness, and in the first class most could do a very easy addition sum. The reading too was much improved, but the writing was still very backward.

Campbell's-row school.

375. From Leeson-street I pass to what I may describe as the highest development of the half-time system of education in Belfast proper. There is one mill school which is in an exceptional condition. It is the only school which adapts its hours to the intention of the Factory Acts, by allowing the afternoon set of half-timers to attend from 2 o'clock to 5; the morning set attending from 10 to 1 o'clock. This is so far as it should be, though even here the complete ideal is not reached. Pay scholars are received as well as half-timers; and on their dismissal at 3 o'clock, the teachers for the most part break up too; and all that the millowners positively require, is that one assistant should remain for the two hours with the mill children, though actually the mistress informed me that she made a practice of staying herself also; and considering the spirit and interest which she throws into her work, I have no doubt she willingly takes upon herself this extra labour. The school is held in a mill belonging to Mr. J. Charters, and is known as Campbell's-row National school. It receives half-timers from Mr. Charters', Mr. Gordon's, and Mr. Kennedy's mills, and they contribute respectively £44, £5, and £16 a year to the support of the teachers. The salaries granted by the National Board amount to £127 a year, and the fees of the pay scholars are £16 or £17 a year, so that the whole income of the school is nearly £210 a year. This sum supports a staff of seven teachers, namely, a mistress, four female assistants, and two monitresses; besides this, a workmistress, who is employed most of the day as a superintendent in Mr. Charters' mill, teaches the girls to sew. On the rolls of the school were 183 half-timers (7 boys and 176 girls), and 83 pay scholars (34 boys and 49 girls). On the day on which I examined the school, there were present 86 half-timers in the morning set alone, and 51 pay scholars; the number of individual children in attendance would therefore be about 223, of whom 137 were present at one time. The proportion of teachers to children is nearly the same as at Leeson-street.

376. I examined this school throughout, that is, the morning half-timers and the pay scholars, excepting only some children at the bottom of the school who were mere infants. The general impression left on my mind was favourable, though there were numerous instances of big girls in low classes who were very ignorant for their years. But the tone of the school was more satisfactory than that of other mill schools, and there were evidences throughout of a desire to make the education prescribed by the Factory Acts a real boon to the children, whereas in some other cases mere compliance with the regulations seemed to be the sole object aimed at. At Campbell's-row no high proficiency is reached; there is no class above the Third Book, and the great majority of the girls are below that. Of the 86 half-timers present at my examination, only 16 were in Third Book, 35 in Second, 10 in First, and 19 on the Card. Considered simply with reference to the several classes they were in, these girls were in a fairly satisfactory condition; but regard being had to their ages, they were in a very backward state. This can be best shown by means of a comparison of their ages with those of the pay scholars in the same classes.

HALF-TIME SYSTEM.

CAMPBELL'S-ROW SCHOOL.	Pay Scholars.		Half-timers.	
	Number in Class.	Average. Age.	Number in Class.	Average Age.
Children in Third Book,	14	9·6 yrs.	16	12·4 yrs.
,, Second Book,	13	9·0 ,,	35	11·7 ,,
,, First Book,	1	5·7 ,,	16	11·6 ,,
,, Card,	24	5·8 ,,	19	10·4 ,,

Comparative ages of pay scholars and half-timers.

377. Roughly speaking, the half-timers were at a point which they ought to have reached from two and a half to five years earlier, or in the aggregate, the half-timers were as much as four years behind the pay scholars. This means, in fact, that the mill girls, who usually enter upon their employment at about nine or ten years of age, begin then, for the first time, to learn their letters, a process which the pay scholars go through at the age of five or six years.

Ardoyne and Milewater mill schools.

378. In this brief review of the Belfast factory schools, I have not noticed two out of the six. One of them is in the village of Ardoyne, outside of Belfast, though attended by half-timers from two of the town mills. It is taught by a master who seems to be very careful and conscientious in his treatment of them; but none of the mill-workers were beyond the Second Reading Book and simple arithmetic. The other is one recently opened by the owners of the Milewater mill expressly for their half-timers. It is as yet in a quite incipient state, held in an upstairs room of an ordinary dwelling-house. None were beyond the Second Reading Book, and only four of those present were in it, and they could do very little in the simplest arithmetic. Though 84 children, half-timers and pay scholars, attended on the day of my visit, there were only twelve copy-books in the whole school, of which three were good, the rest indifferent or bad. This school is under two female teachers.

Net result of the half-time system in Belfast.

379. It appears, then, that of the six Belfast factory schools, only three have any half-timers who have reached the Third Reading Book; in these schools the children in the Third Book form a very small proportion, about 10 or 11 per cent. of the whole, while fully half are only in the First Book or the Card, learning to form letters and figures on slates, and commencing, some of them, the simplest possible sums in arithmetic. That is the present net result of the half-time system in Belfast. The most that can be said for it is that by means of it some clever or industrious children are carried just far enough to enable them, after leaving school, to turn the little knowledge they have gained to some account, while the greater number of those who come within its scope are sent away with so small a smattering of the rudiments of knowledge, that unless it be afterwards followed up and improved at a night school, it will quickly be entirely effaced from their memories.

Ignorance of full-time factory girls.

380. The prevailing ignorance of the full-time factory girls—due partly to the insufficiency of the half-time system, and partly to the total immunity from instruction of any kind, of which many, who have entered work at once on full time, have been the victims—is brought out with painful certainty and clearness in the larger night-schools, which many of these girls attend, when at last they have learnt to be ashamed of their inability to read or write. The largest school of this kind which I visited is that kept by the nuns of Crumlin-road convent. Here I found 318 girls and women in attendance out of 420 on the rolls. The ages varied from about thirteen or fourteen to twenty-one or twenty-two years of age, the average age being, perhaps, about nineteen. The school being under the National Board, the girls are divided into classes reading the several National school books, just as is the case with an ordinary school. Attention is directed almost exclusively to reading and writing, and the time (about an hour and a half) is equally divided between the two subjects—half the girls writing while the other half reads. The distribution among the several classes was as follows:—

Crumlin-road Convent night school.

	Number on Roll.	Number present.
In First Book,	180	136
,, Second ,,	160	122
,, Third ,,	43	28
,, Fourth ,,	37	32

381. This classification depends almost entirely on ability to read. It is impossible, in the short period in which night schools are in operation—usually three evenings in the week for eight months—to attempt the full course pursued in day schools. Therefore what the classification means is that out of the 420 girls, 340 are not sufficiently advanced in reading to be put into a class learning to read the Third Book in the National series. Perfect ignorance of arithmetic or grammar would be no obstacle to advancement, for these are not taught; the measure of a girl's knowledge is her ability to read. I heard some of the drafts read, and I should say that they acquitted themselves as well as corresponding classes in day National schools would do. In the highest classes the reading was very satisfactory. In writing there was great diversity of attainment, some in the highest class writing very well, some who could read fairly well being backward in this respect.

Occupation of the scholars.

382. The great majority of these girls were from the mills. I extracted from the Register the occupation of the thirty-seven girls in the highest class as a sample:—

The factory-workers were—10 weavers, 8 spinners, 5 doffers, 2 reelers, 2 winders, 1 spreader, 1 folder: total, 29.

The rest were—2 dressmakers, 1 capemaker, 1 milliner, 1 housekeeper, 1 machine-stitcher, 1 paper-stainer, 1 book-gilder: total, 8.

The moral benefits of this school even greater than the educational.

383. I have no doubt that in the lower classes the proportion of factory girls would be still greater. Of course, the knowledge which the great mass of these girls have acquired is almost infinitesimally small; and, to produce any rapid progress in their learning, a staff of teachers would be required such as the £10 per 100 scholars allowed by the Board would do little to remunerate. But, however slow the progress, and however small the ultimate result may be, there are other non-educational benefits conferred by this night-school which give it a value far beyond what is due to the mere secular teaching to be received within its walls. No class of people stands more in need of humanizing influences than the workers in large factories. There is daily evidence in the streets of Belfast that the lives they lead have a tendency to deaden the sense of propriety and reserve, and to turn the girl into the hoyden. Whether it is due to mere ignorance and unenlightenment, or to the associations which meet them in their daily work, or more probably to both causes, I cannot say; but even at ordinary night-schools the signs of roughness and insubordination are too frequent and manifest to be misinterpreted. But at the nuns' night school a marked difference is observable. Nothing could surpass the sober, well-behaved seriousness of the girls in the higher classes. Indeed, so proper and respectful was their demeanour, so cleanly and neat were they in dress and person, that familiar as I was only with the more usual type I did not at first take them to be factory girls at all. They had left the

HALF-TIME SYSTEM.

mills at six o'clock in the rough, dirty clothing which all millworkers must wear; but they appeared at school at seven o'clock in the garb of well-dressed, respectable women. This was not the case throughout the school; the decency of external appearance grew less in proportion as the girls were in lower classes in the school; and towards the bottom there were plenty who brought with them the usual unmistakable signs of the work on which they had been employed. But if all these girls could be induced to remain at the school long enough to be softened by the nuns into the tone which pervades their third and fourth classes, to say nothing of the opportunities they would then have secured for future self-improvement and recreation, they would have gained such a step in self-respect, and have been trained into such a spirit of decency and order as could not fail to manifest itself in happier homes and better lives.

The religious difficulty in factory schools

384. One very important feature about the factory schools in Belfast remains to be noticed. The employers of children on half-time have been brought face to face with the necessities of a mixture of religious denominations, and it is interesting to observe how the case has been met by them as practical men in whose eyes a millworker is a millworker, whether Protestant or Roman Catholic, and who have nothing to do with the religious differences of the hands they employ.

385. Two plans are open to them in providing schooling for their half-timers. They might either send the children of each denomination to a school under corresponding management and teaching; or they might send all their children, regardless of religious denominations, to one and the same school. The former plan would obviously entail additional trouble and even confusion, and in the case of children born of mixed marriages—that is, marriages between a Protestant and a Roman Catholic—the manager would be liable to all the unpleasantnesses which are constantly arising about the choice of a religion for the child. On the other hand, if the children were sent to the same school, difficulty would be likely to arise about religious instruction; for those children who by the rules of the National Board would have to be sent away during the period devoted to religious teaching, would lose so much time, and, except by means of arrangements entailing extra labour on the teachers, their attendance would fall short of the requirements of the Act.

solved in Belfast by secularization.

386. The mill-owners in Belfast have taken the course which practical common sense dictated. They will not be troubled with a multiplicity of schools when one school can do the work perfectly well; and they will have no cavilling on the ground of religious instruction. They send their half-timers to a single school, and they make that school purely secular, leaving the onus of religious teaching entirely with the ministers of religion. These six schools are the measure of *bonâ fide* united education in Belfast, if we except the model school; and it is a noteworthy fact that where the educational problem has been dealt with by practical laymen in Belfast, the unanimous solution has been by means of complete secularization.

Denomination of half-timers.

387. How complete the mixture of denominations is will appear from the following extracts which I made from the several school rolls.

Denominations of half-timers on the roll at

	Estab. Church.	Rom. Cath.	Presb., &c.
Campbell's-row National school, . . .	37	102	44
Winetavern-street ,, ,, . . .	26	53	22
Leeson-street ,, ,, . . .	31	62	31
Pilot-street ,, ,, . . .	42	72	17
Edenderry (Ardoyne) ,, . . .	26	40	27
	162	329	141

besides those at the Milewater mill school, which being only in course of organization at the time of my visit had not been supplied with roll books. The mistress said she believed that most of her mill children were Roman Catholics. A slight majority of the whole number of half-timers are, therefore, Roman Catholics. The owners of the mills at which they work are Protestants, and the teachers of the schools are all Protestants likewise. As a mere matter of policy, and not because I heard the slightest imputation on the impartiality with which these schools are conducted, it would, I think, be well if the managers, having so mixed an attendance of children, would mix their teachers also. If a due proportion of Roman Catholic teachers were introduced, these schools would be complete examples of the united system of education.

Factory schools in villages near Belfast.

388. The factory villages in the neighbourhood of Belfast which fell within the district assigned to me for inquiry, namely, Whitehouse, Whiteabbey, and Ligoniel, present somewhat different examples of the mode in which the question of the mixture of denominations has been dealt with.

Whiteabbey school.

389. The Whiteabbey Flax-spinning Company follow the example of the Belfast mills, and send all their half-timers to one large and well-ordered National school, officered at present entirely by Protestants. I was informed, however, that there was lately a Roman Catholic female assistant. The majority of the half-timers here are Presbyterians, the number on the roll being ten of the Established Church, twenty-one Roman Catholics, and forty-seven Presbyterians. This school is not entirely secular. The Protestant half-timers receive religious instruction together with the ordinary scholars: the Roman Catholics have now no religious instruction at all, but as there are separate boys' and girls' school-rooms there is no difficulty in reserving a room for them, in which they go on with secular subjects while the Protestant boys and girls are massed together for Bible reading; when there was a Roman Catholic assistant, she conducted the religious teaching of those of her Church. It may be regretted that the Roman Catholics should be under any kind of disadvantage as compared with their Protestant school-fellows, but there are no symptoms of ill-feeling on the subject. Besides the twenty-one half-timers there were thirty-one ordinary scholars, who were Roman Catholics; and as the whole number of Roman Catholics on the roll was but fifty-two out of a total of 391, the school is in the main Protestant, and the claim of the Roman Catholics to equal treatment is less strong than it is in the more evenly mixed schools of Belfast.

Whitehouse schools, and the principle of combined education.

390. At Whitehouse, a few of the half-timers, Protestants only, attend the Church school: the greater part go to the National school, the theory of which is in the main such as I have suggested as desirable in Belfast. The majority of the children are Protestants, and the school is under Protestant management, but the teachers are mixed. Out of a staff of twelve, including monitresses, three are Roman Catholics. This number is not in precise accordance with the numerical proportion of Roman Catholic children in the school: they are 161 out of a total of 420, or more than one-third part: but this is not very material. The great point is to have a Roman Catholic and a Protestant teacher always present at the same time in the same room, by way of guarantee: what may be the precise proportions of the mixture is a question of secondary importance.

Harmonious working of the system.

391. Owing to a happy harmony of action which distinguishes this village and its school, no difficulty is experienced in carrying on the religious instruction of all denominations. As I have already mentioned, under another head, the Roman Catholics are gathered into a separate room—used at other times as an infant school—where they are taught by the teacher of their own Church, and regularly once a week by their parish priest. The Protestants remain in the chief school-room, where in a recess, which is almost as good as a separate room,

the children of the Established Church are taught—they, too, are frequently instructed by the rector. The Presbyterians, the most numerous body, occupy the main body of the room, and are also occasionally visited by their minister. If the question is asked why, in view of the harmonious working of the provisions for religious instruction in this school, I have implied an approbation of the plan of secularization, which has been followed by the mill-owners of Belfast, the reply is, that Whitehouse is a very different place from Belfast. In small places it is possible, by a judicious avoidance of all causes of irritation, to unite the clergy of different denominations in assisting the work of a single school, to which the main body of the parishioners of all denominations send their children. But no such support can be expected in a town like Belfast; where there is no necessity for combination, the rule is not union, but division; and I am afraid it is but too certain that the patron of a mixed school in Belfast would appeal in vain to the clergy of a church opposed to his own for any aid in providing religious teaching for the children whom that church might claim to educate in matters of faith. HALF-TIME SYSTEM.

392. At Ligoniel, the plan on which the half-timers are educated is not a united, but a separate one. There are four different mills which employ children's labour, and three different National schools—one Presbyterian, one Wesleyan, and one Roman Catholic, each attended by half-timers. The Roman Catholics from all four mills attend "Wolfhill National school," which is a lean-to of the Roman Catholic chapel, and was originally an aisle open to the rest of the building. Its thoroughly denominational aspect was rendered the more striking by the broken chapel windows, which told of the memories of the recent 12th of July. The "Wolfhill Mill National school" is a new school, built in 1865, by the Wolfhill Spinning Company, and attended by the Protestant children employed by them, and those from Messrs. Waring and Duncan's mill; it also receives some of the half-timers from the third, or Ligoniel mill. The third school, known as "Ligoniel village National school," receives the remainder of the Protestants from Ligoniel mill, and also those from the remaining, or Ballysillan mill. Ligoniel schools and the principle of separate education.

393. Two of these schools—the Wolfhill National, and the Wolfhill Mill National—are about a stone's throw apart from one another. The village National school is, perhaps, half a minute's walk from these.

394. Here we have, in fact, the denominational system fairly at work, in contrast with the combined system which is in operation at Whitehouse. Let us see what is the effect it produces as regards the Roman Catholic children, on whose account especially the present plan has been adopted. The Wolfhill Spinning Company, as I have said, have provided a school expressly for their half-timers, to which ordinary pay scholars are also admissible. The school-room is one of the best I have seen—seventy-five feet long, by twenty-six feet broad, and lofty in proportion. On the rolls of the school were, half-timers, forty-seven boys, and sixty-three girls; pay scholars, seventy-two boys, and eighty-eight girls—in all, 270 children; of these 195, including both sets of half-timers, were present on the day of my visit. The teaching staff consists of a master of the first grade of the first class, in receipt also of "good service" salary, one male assistant, two female assistants, one monitor, and two monitresses. The teachers are, therefore, in the ratio of one to less than forty children on the roll. The school is in excellent order; the master is an energetic and capable man, and though, as in all other factory schools, I found many half-timers in a very backward state, the general standard was decidedly better than elsewhere, and the most advanced half-timers (boys) were in a really satisfactory condition. Here alone, of all the half-timers I examined, did I find a boy who could state a simple proportion. The Wolfhill Mill school.

395. But the Company allow their Roman Catholic half-timers the privilege of attending, in lieu of this excellent school which they have provided, the school which adjoins the Roman Catholic chapel. It is held in a bad room, not built or properly adapted for a school, thirty-six feet long, by fifteen feet broad, with a sloping ceiling, which at the lowest part is only six feet high. On the roll were forty-seven half-timers (twenty-three boys and twenty-four girls), and fifty-two pay scholars (thirty-three boys and nineteen girls), in all, ninety-nine children. Of these fifty-eight were present in the morning, and with the afternoon set of half-timers, the attendance would be raised to seventy-three or seventy-four children. For these the teaching power was concentrated in one third-class master, who had been working single-handed for the four months preceding my visit, though it was expected an assistant would be very shortly provided. It was, of course, impossible that the school should bear a comparison with the ample staff and complete apparatus of the Protestant school, and I found the performances of the children throughout poor and unsatisfactory. The Wolfhill school.

396. If there were a genuine competition on the score of merit between the two schools, there might be something healthy and stimulative in their rivalry. But there is no genuine competition. The Roman Catholic children all, without exception, go to the inferior school, in obedience to the directions of their clergy, and not one of them is tempted to desert it by the superior merits of the mill school. But, on the other hand, the Protestants, living under no such stringent regime, and being free to attend whichever school they prefer, do actually in some cases patronize the inferior school. The Roman Catholic school may at any moment succeed in drawing off Protestant children from the Protestant school; but in no case has the Protestant school any chance of withdrawing a Roman Catholic from the rival school. This sort of competition, No genuine competition between the two schools.

"Si rixa est, ubi tu pulsas, ego vapulo tantum,"

being entirely one-sided, is injurious and demoralizing. At the period of my visit the master of the Roman Catholic school had on his rolls the names of eight mill-children belonging to the Established Church, of whom five had come in a bunch the preceding week, and had assigned as their reason for deserting the Protestant school a wish to punish the master for having reported them at the mill for irregular attendance, and having thus got them fined. The Roman Catholic master said he did not expect to keep them long, as the whole matter was merely one of spite, and already some of the eight were falling off from him. I have noticed elsewhere similar abuses, to which the multiplicity of schools give rise. The practical result of the whole case in Ligoniel is, therefore, that the Roman Catholic children are all gathered by themselves into one inferior school, instead of attending a better school in conjunction with their Protestant associates at the mill; and this is the price they have to pay for the virtual denominationalism which has been established, with the sanction and support of the National Board, in the village.

397. Meanwhile the broken windows of the chapel bear witness to the religious differences which the separate system brings into more prominent relief, and, if the generalization be not too hasty, forces on the mind the contrast presented by the harmonious working of the united system in Whitehouse, where the minister of each denomination gives his support to one and the same school, and where the Roman Catholic priest, the representative of the minority in the place, assured me that he and his people lived in peace and good will with their Protestant neighbours, and presented a spectacle of unanimity unhappily only too scarce. Contrast between the two systems as exemplified at Whitehouse and Ligoniel.

398. It will be convenient to notice here a school of a somewhat analogous character which I visited and examined with a view to ascertaining the results of the practical working of the Print Works Act, so far as it touches the education of the children whose employment it purports to regulate. There are two establishments for The Print Works Act.

HALF-TIME SYSTEM.

print works in Belfast, one of which has no school in connexion with it. The other, known as the Old Park Print Works, which has gathered about itself a small village in the outskirts of the town, peopled entirely by the hands it employs, has a National school close to the works, and under the patronage of Mr. Girdwood, a member of the firm to which the works belong. The regulations concerning the employment of children in print works are quite distinct from those laid down by the Factory Acts. The Print Works Regulation Act, 8 & 9 Vict., c. 29, which was, I believe, the earliest legislative provision for the education of children employed in associated labour, enacts that:—1. No child shall be employed under the age of eight years. 2. No child shall be employed at night, that is, between the hours of 10, P.M., and 6, A.M. 3. Before employment a child shall show a certificate from a schoolmaster declaring that the child has attended school for at least thirty days and not less than 150 hours in the preceding half year, no attendance of less than two and a half hours on any one day being reckoned, nor any attendance beyond five hours in any one day being reckoned for more than five hours. This certificate has to be renewed every half-year.

Regulations of the Act concerning school attendance.

399. Briefly, the effect of these regulations is, that the children employed in print works, so far from being half-timers at school, need attend school only for one-sixth part of the time for which an ordinary scholar, if regular, would attend. Together with this infinitesimal amount of schooling a child may be employed for almost any number of hours in a day at work. It may have spent five hours in the day at school, and yet there remain eleven hours between 6, A.M., and 10, P.M., during which there is no restriction on its labour.

Character of the children's employment.

400. In point of fact, children do spend a great many hours at work; but their employment in connexion with block-printing, which is the process carried on at the Old Park Works, is certainly very simple and easy. They are called "tearers" (pronounced "teerers," a word evidently derived from the French *tirer*), and their employment consists in simply drawing a brush over the colouring-plate, whenever the printer has applied his block to it. For this work the children receive no pay, for the plan is for fathers and brothers to obtain the help of daughters and sisters for this work; and the owners of the works leave the appointment and employment of tearers entirely to the printers. They may employ such assistance or not, as they like, and on whatever terms they choose to arrange; but as the system here is one of piece-work, it is to the interest of the workman to have a child at hand to keep his colouring moist and fresh. To do this himself would be troublesome to him, and it is very light labour for a child. Moreover, the atmosphere of these works is very much more wholesome than that of a spinning-mill; and, accordingly, in spite of long hours, I found the "tearers" of the print works a far more healthy-looking set of children than are the "doffers" from the mills.

The Old Park Print Works National school.

401. But the operation of the educational provisions of the Print Works Act appears to me to be little better than a farce as regards the children, and utterly subversive of all order and regularity as regards the school they attend. I paid two visits to the Old Park Print Works National school, which is mainly composed of ordinary pay scholars. On the first occasion I arrived, as usual, unannounced and unexpected. It was about eleven o'clock, and I spent the first half hour in conversation with the master. On a table beside his desk lay a slate, and I observed that every now and then a boy or girl came up, wrote his or her name on the slate, and then left the school. At half past eleven I asked the master to call out all the "tearers" for me, as he told me that thirteen had put in an appearance that morning. To my surprise he said that only one of the thirteen was present. "Where were the other twelve?" I asked. "Oh," said the master, "they have just left. They are wanted at the works, and so I get them to put their names on a slate, and at half past eleven they may go." As the school does not open till ten o'clock, this hour and a-half's attendance had no very obvious purpose; for no shorter period than two and a-half hours is allowed to be reckoned for the purposes of the Act. But the master explained; though this short attendance is of no avail for the purposes of the Act, it is available with reference to the statistics required by the National Board. These names on the slate are all reckoned in the day's attendance as entered in the Report Book, and by aid of them the average daily attendance is kept up. Every day some of these "tearers" look in for this short time, not, as may well be supposed, from any keen desire to improve the passing hour, but in compliance with the master's wishes. On this morning, then, twelve out of the thirteen "tearers" were clean gone at half past eleven o'clock, and only one remained to make up an attendance which could be reckoned for the purposes of the Act. This was a girl who said she was twelve years old, and had been three years in the works as "tearer" to her brother; but a reference to the school register proved that she had entered school in October, 1864, when she was seven years old; this would make her age eleven years. She said she had never attended school until she became a tearer; if this was so, her employment at that age would of course constitute an infringement of the Act; it is more likely, however, that her memory was at fault on this point, as it had been about her own age. But she had certainly been at school for about four years (my visit was on September 21st), of which probably the first half year was spent in qualifying for employment under the Act, and the remaining three and a-half years in employment as a tearer. She was not a dull girl. On the contrary her countenance and her replies to my inquiries bespoke somewhat more than the average of natural intelligence. She was still in the first reading book, and could scarcely spell out a few easy monosyllables. She could not do the simplest addition sum, and a few words that she tried to write down for me on a slate were all but illegible. She was not shy, and I have no doubt did herself justice. And this was the outcome of four years' instruction under the Print Works Act.

Examination of the "tearers."

402. I arranged with the master for a special attendance of all the "tearers" in the works on a future occasion, and on the appointed day, September 26th, they assembled to the number of 48. These included a considerable number who had not qualified at this school, but had attended some school in the town. The whole number of "tearers" on the roll of this school was 32, viz., 21 boys and 11 girls. But the whole 48 were examples of the system. I examined them all. There were 8 boys and 1 girl in the Third Reading Book. Their average age was 11⅓ years each. They did sums in the simple rules fairly well, and some were beginning compound addition. They wrote an easy piece from the Second Reading Book for the most part correctly, and their handwriting and reading were not unsatisfactory. These were the *elite* of the school.

403. The next class, in the Second Reading Book, contained 21 boys and 7 girls. Their average age was within a small fraction the same as that of the class above them—it was just over 11¼ years. Their reading was, for a Second Book class, tolerable. Out of four sums in the simple rules (addition, subtraction, multiplication by 6, and division by 8), 13 out of the 28 children did at least two sums right: two boys did all four right. I gave them for dictation the passage—

"Look at the flowers that cover the fields, and the plants that are trodden in the green park. All the country appears so fresh and so flourishing."

404. Eight children in the class wrote it out with not more than three mistakes apiece in spelling; none were quite correct. The performances of ten in the class in arithmetic and dictation were as follows:—

HALF-TIME SYSTEM.

1. Girl,	Age, 10 years past,	No sum right,	12 words misspelt in dictation.
2. Girl,	,, 10 ,,	,,	6 ,, ,,
3. Girl,	,, 12¾ years,	,,	11 ,, ,,
4. Boy,	,, 12 years past,	One sum right,	10 ,, ,,
5. Boy,	,, 11 ,,	,,	10 ,, ,,
6. Boy,	,, 12 ,,	No sum right,	6 ,, ,,
7. Boy,	,, 12 ,,	,,	9 ,, ,,
8. Boy,	,, 10 ,,	One sum right,	11 ,, ,,
9. Boy,	,, 11 ,,	No sum right,	9 ,, ,,
10. Boy,	,, 12 ,,	,,	12 ,, ,,

405. Below this class were nine boys and four girls, whose average age was fully 10½ years; some were already in Second Book, others just moving into it. The following is a record of their doings:—

—	Age last Birthday.	Two very simple addition sums.	Dictation: "The Cat ran up a tree."
1. Girl,	10	Nil.	Nil. On being asked to write down "the," she said, "I don't know how to make a t."
2. Boy,	10	Both right,	Correct.
3. Boy,	10	One right,	One mistake.
4. Boy,	12	Both right,	"The cat rane oupe the a tree.'
5. Boy,	10	Both right,	Correct.
6. Girl,	11	Nil.	Illegible.
7. Girl,	10	Nil.	Nil.
8. Girl,	10	Neither right,	Half correct.
9. Boy,	10	Nil.	Half correct.
10. Boy,	12	Nil.	Half correct.
11. Boy,	11	Both right,	Correct.
12. Boy,	10	Nil.	"GAT." (No more.)
13. Boy,	11	Both right,	Correct.

These are the results of a specially favourable working of the Act.

406. It may be urged in excuse for the very unsatisfactory state of the worst of the Belfast factory schools that they have been only recently organized for the education of half-timers. The perfect absence of enlightenment frequently found among the "doffers" is explained by the fact that they never went to school at all till their recent employment as half-timers at the mills. But the above record represents the settled normal state of things under the Print Works Act, with the exceptional aid of extra attendance at school. These are the mature fruits of the system under favourable administration, and nothing better can be looked for till the law is altered, and the education of the "tearers" deemed worthy to occupy something more than two months in the year.

Amount of actual school attendance by "tearers" which the school books disclosed.

407. I have already mentioned the short morning attendances of the "tearers" over and above the hours required by the Act. Whether the National Board are satisfied that these brief appearances should be counted in full is a point to be settled by them with the master. It is at least inconsistent that while teachers of factory schools have to halve the number of the half-timers in recording their attendances, the far shorter stay made by many of the "tearers" should be reckoned in full. But I do not question that the interest which the master has in obtaining the presence of these children in the morning has redounded to the benefit of the children themselves, and that if they had done no more than fulfil the minimum requirement of the Act they would have been found in a far worse condition, educationally, than now. During the eight months, from January to August, 1868, the average monthly attendance entered in the report book, of "tearers" alone, had been 11·3 boys and 5 girls, out of 24·1 boys and 11·1 girls on the roll. This is equivalent to an attendance of 46 per cent., calculated on the whole number of children, or something like half time. When all the Act requires is one-sixth of the time, this fact would at first sight appear equally remarkable and satisfactory. But the explanation has been already supplied: the greater portion of these attendances are for about an hour and a half only out of the five hours for which the school is open. In estimating the results, then, which I have recorded of my examination of this school, it must be borne in mind that the average requirements of the Act have been supplemented by the pressure exercised by the master, by which he succeeds in securing the presence, if only for a short time, of each "tearer" on an average nearly every other day.

Injurious consequences of uncertain attendance.

408. It is obvious that the uncertainty of the attendance of these children is ruinous to the regular action of a school. Sometimes, if work is slack, a child attends for full time every day in the week. Then it is not seen again for weeks. Eventually, when the half year is drawing to a close, it has to come frequently in order to make up its minimum number of hours. And it devolves upon the teachers to endeavour to conduct the education of such children on something like a concerted plan. There can be no continuity of progress and little interest in the work of the school under conditions of attendance so desultory and uncertain.

Review of defects in half-time system, and suggestions of employers and others.

409. Before quitting the subject of factory schools, I will here briefly review the points which appear to me, judging from such opportunities as I had of observing the system, to be the principal defects developed in the experience of Belfast. This experience is no doubt not that of English manufacturing towns, and all that I have to say must be understood to be applicable to Belfast and its immediate neighbourhood only. On some points I am able to adduce the testimony of millowners, clergymen, and others, who favoured me with their views and suggestions for the improvement of the half-time system.

410. From what I have said of my examination of the factory schools, it will be seen that on the whole the standard of attainment in them is exceedingly low. Whether half-timers in England ever succeed in reaching the same point of proficiency which is attained by ordinary full time scholars, I do not know, but in Belfast they fall very far short of the average National school standard. Campbell's-row school may be taken as a favourable example, and there, as I have shown, the half-timers were, on an average, four years behind the other children in attainments. Moreover, a very large proportion of the whole number of half-timers are almost totally ignorant. This is due to several causes.

1. The ignorance of the children when they enter the mills.

(1.) Ignorance of children at entrance.

411. It was frequently remarked to me that this ignorance on entry is brought about in part by these very educational regulations of the Act. Parents who intend to get their children into a mill when old

HALF-TIME SYSTEM.

enough, make the half-time system their excuse for not sending them to school before. If remonstrated with for their neglect, they say that there is no need for them to provide schooling for the children; the children are useful at home, and as for learning, they will have that provided for them at the mill, so soon as they are old enough to be employed there. This excuse appears to them so reasonable, and coincides so entirely with their own immediate convenience, that it may well be believed that it effectually quiets the little uneasiness of conscience with which they might otherwise be troubled. When, therefore, the child is taken into employment, it begins to attend school at the earliest at eight or nine years of age, very frequently not till eleven or twelve, and has then to learn the very first rudiments which other children have learnt at an infant school. The effects of this late commencement of schooling are thus described to me by Mr. Samuel Barbour, the master of Wolfhill Mill National School:—

Testimony of a schoolmaster.

"As a general rule half-timers have been neglected in their education up to the time they enter the mill. Indeed some of them have never been at school before. Their progress is very slow in consequence. Those who have never been at school rarely ever get out of the cards or First Book before they enter the mill full time. The few who enter the mill half-time having been as far advanced as good second-class pupils make very fair progress, indeed very little behind the regular attenders. As a general rule they leave when in the Second Book, knowing only the simple rules of arithmetic. Some leave before entering the Second Book, and a very few when in Third Book. The system will never be successful till the half-timers before entering the mill as such, are good second-class pupils. A simple clause in the Factory Act to this effect, would remedy a serious evil, and could not by any possible means be a grievance to any."

412. This complaint is the complaint of all the factory school teachers. The children come as overgrown infants, but without the tractability of infants, requiring all the minute care and attention which an infant school is specially fitted to afford, but by their age and associations no longer amenable to the same influences. They start badly, conscious of their inferiority in knowledge to the other children, and being left behind from the first, they lose their interest in learning, and seldom or never make up the ground they have lost. The desirability of enforcing an educational test before admission to the mills was urged by other persons in a less definite form, but it appears to me that Mr. Barbour's suggestion, by which none but second class pupils in National schools should be admissible, would not only meet the necessities of the case, but would be extremely easy to put into effect.

Suggestion to admit none but Second Book children on Inspector's certificate.

413. There are grave objections to be urged against a special test examination, for which children might be crammed, but there can be no objection to allowing the District Inspector to certify that a child has satisfied him in the ordinary requirements of the Board for a class reading in Second Book. If a clause to this effect were introduced into the Act, parents would soon find it to be for their interest to send their children to school a couple of years before they could legally enter the mills. The difference to the children would be immense; the factory schools would be relieved of the incubus of dense ignorance which now weighs them down, and the parents would be taught to associate education with material interests, and to regard school attendance as one of the necessaries of early life.

(2.) Unsuitableness of factory schools.

2. The unsuitableness of the schools for the work they are called upon to do.

414. The schools are arranged on the supposition that the children are full-time pupils, and half-timers have to fall in with the plan of the school-work as best they may. For them the schools are no better than a make-shift.

415. Mr. M'Ilroy, one of the District Inspectors of National schools in Belfast, writes:—

Testimony of a District Inspector.

"Every factory should be obliged to have a school in connexion with it for half-time workers only. The present arrangement of half-time pupils attending schools intended for full-time pupils, is extremely unsatisfactory. If the time table be at all adhered to, the course of instruction for half-time pupils must be quite unsuitable. This has been attempted to be remedied by alternating the attendance fortnightly or monthly of morning and afternoon pupils, but without success."

Schools should be specially adapted to half-time system,

416. I have already expressed my own conviction, drawn from independent inquiry and examination, that the only satisfactory method of treating the half-timers is to be found in requiring, as Mr. M'Ilroy suggests, special factory schools to be planned on a half-time, instead of a full-time principle. Possibly, in course of time, things may so shape themselves that, without legal interference, the mills may find it to be for their interest to establish special schools. Some are already adopting the plan. But in every case it should be insisted upon that the school should be for the half-timers, and not the half-timers for the school. Until this is done it is vain to look for adequate results.

with an hour's interval at mid-day.

417. A most important requirement in such special schools would be that there should be an interval of one hour between the time at which morning work at the mill ends, and afternoon work at the school begins, and it should be the duty of the teachers and inspectors to see that the afternoon set at the school comes washed, and with changed clothing.

418. I have already given reasons for my belief that the half-time system properly carried out, is preferable to a full-time system on alternate days. The latter plan is, however, not without its advocates. Mr. John Barbour, a millowner in Belfast, says:—

Opinion of a millowner.

"The factory Act I consider *good*, and *not too* stringent. I think it would be an improvement where half-time workers (children above eight, and under thirteen) are employed, if employers would employ them on alternate days, and not a part of each day, as at present. The children are not in a proper state of dress when leaving work to go into school, and *vice versa*. It breaks the day into too many divisions, part at home, part in mill, and part in school."

419. Mr. Barbour's objection on the score of dress would be obviated if the hours at the school were properly adjusted, and it appears to me that the loss, if any, by subdivision of time is more than compensated by relief from the strain which anything beyond six hours of continuous work, must entail on a child's health and strength.

The allowance of teachers should be increased,

420. Connected with this branch of the subject is the inadequacy of the teaching power at present employed in many of the schools. I have already referred to the rule of the National Board, which requires teachers to halve the number of their half-timers before striking their average of attendance. On this point Mr. James Montgomery, a member of the Wolfhill Spinning Company, and manager of the Wolfhill Mill National school, writes as follows:—

"I consider the present system of making *two* half-timers count as one in the average of attendance a very injurious one, as it lessens the teaching staff, whereas the staff should be equal to the entire number in attendance, because although only half of the half-timers is present at any one time, still there is much more energy required on the part of the teachers than in the case of the same scholars remaining the whole school hours. I have given much consideration to this subject, and would rejoice to see a change."

and their presence throughout the school-time ensured.

421. Unfortunately, the case as Mr. Montgomery puts it is not always the whole case. In schools less complete and orderly than that which the Wolfhill Spinning Company maintain, even the staff such as it is, is not fully available for the half-timers. Attendance at school within the meaning of the Act may be interpreted in

different senses. A manager who is anxious for the welfare of the children will insist that the school shall be in complete *bonâ fide* operation throughout the time that the mill children are present. Another may be satisfied to know that the children are in the school-room, with a single assistant to keep up the show of a school. I have already mentioned that at Campbell's-row school the mistress voluntarily stays to the end with the half-timers, though the mill-owners are satisfied if a single assistant remains. At Ligoniel village National school the afternoon set arrive at about twenty minutes before one o'clock, the mill changing hands at 12.30. The Act is considered to be complied with if the children remain till half-past three o'clock. The ordinary pay scholars are dismissed at three, and the master then leaves the school, while a female assistant remains with the half-timers. No doubt the last half hour is thus rendered practically valueless, and a strong temptation arises in the mind of the teacher to cut short what she feels to be a farce. I looked in upon this particular school at 3.15 P.M., and encountered the children just pouring out into the road, and found the assistant putting on her bonnet to go.

HALF-TIME SYSTEM.

Arrangement of hours at Ligoniel village National school.

422. At Wolfhill National school—the one in connexion with the Roman Catholic Chapel—it is the first half hour of the day that is practically sacrificed. Two of the mills from which it draws its half-timers change hands at 12, the other two at 12.30. Therefore one set of mill children is supposed to attend from 9 to 12 and another set from 9.30 to 12.30. This is in itself sufficiently confusing and injurious to the work of the school, and to meet the difficulty the first half hour, from 9 to 9.30, is devoted to recreation, during which the children as they come pass through the school-room into a yard at the back, which serves as a play-ground. On my arrival at 9.30 I found all the school and the master with them in this yard, and the school-room empty.

At Wolfhill National school.

423. The only difference between the practice of these two schools in dealing with the separate time required by the half-timers beyond the regular school hours is that in the one case half an hour due to the afternoon set is frittered away and cut short; in the other, half an hour due to the morning set is openly devoted to play.

In either case half an hour sacrificed.

424. Nothing can show more conclusively the practical incompatibility of the full time and half time attendances at the same school; and while it may be granted that the factory schools have a claim for more liberal treatment by the National Board, their plea can hardly be sustained unless it be also ensured that the teaching power granted shall be thoroughly utilized, both as respects the presence throughout of a due proportion of teachers, and the full occupation of the available time.

3. The early age at which admission to the factories is permitted by the law.

(3.) Early age of admission allowed by law.

425. As far as mere bodily health is concerned, I imagine no one will question that it would be far better for a child of eight or nine years old if it had *not* to rise at five or half-past five o'clock on a dark winter's morning; walk through wet and cold on bare feet to the mill; work there in rooms heated even beyond their usual temperature, by gaslight, till breakfast time; and then return, after half an hour's interval, to work again till mid-day. Easy though their work may be in itself, the employment is so unnatural at that age that it must affect the health; and though I can speak with no special knowledge of sanitary matters, I have never failed to observe the too patent effects of their work in the countenances and physical development generally of the half-timers, especially of the girls, who are the great majority of the whole number employed. The injury to bodily vigour, of course, acts powerfully upon the process of mental development. One firm of spinners, that of Messrs. John Savage and Co., go so far as to say that they "are decidedly unfavourable to the employment of young children in mills," adding that no amount of wages can compensate for the neglect of their education. Another manufacturer—Mr. John Campbell, of Mossley—gives it as his opinion that "no child under thirteen years of age should be allowed by law to get up at five or half-past five in winter, as many must do who have to be at work at six o'clock."

Opinions of millowners

426. To the same effect the Rev. R. Hannay, Incumbent of Christ Church, Belfast, mentions fifteen years as the earliest age at which a child should be allowed to enter a factory; the Rev. Dr. Killen, Presbyterian minister at Comber, says fourteen; and the Rev. J. E. Costello, Incumbent of St. John's, Whitehouse, considers it would "be better for the children, both as respects health and education, if they were not allowed into the mills until ten years old, and were kept half time at school until fourteen."

and of clergymen.

427. To prohibit employment before the age of fifteen years would be tantamount almost to a prohibition of children's labour altogether; but Mr. Costello's more moderate proposal, if combined with the suggestion to which I have already referred, that a child should be required to pass the Inspector's examination in a Second Book class before admission would, I believe, with a minimum of inconvenience, work a maximum of good. There would be a little exercise of self-denial enforced on the parent in postponing for two years the earnings of the child, and without the suggested educational test there would be in many cases a postponement also of the first lessons in the alphabet. But if the test were enforced, some postponement of the period of entry into the mills would follow almost as a matter of course. The majority of the children would not be in the Second Book at eight years of age, unless the parents had looked after their schooling very much better than they would be likely to do.

Age should be advanced from eight to ten years.

428. The only serious objection which I heard urged against a postponement of the age of entry was that unless a child began to learn very young it did not gain that lightness of finger which is desirable in some portions of its work. But in answer to this it may be remarked, that though it may be less easy to teach a perfectly ignorant child of ten years old than a perfectly ignorant child of eight, it is quite an open question whether a decently educated child of ten would not be more docile than one of eight years only.

An objection to this advance not substantiated.

429. While on this point, it may be as well to mention that there exists a wide-spread belief in the minds of many persons in Belfast, well-qualified to judge, that the regulation concerning age at admission is constantly evaded by the parents. It is the business of the Medical Inspector to see that the Act is complied with in this particular; but all kinds of devices are resorted to with a view to misleading him. Of course the employers know nothing of this. The Rev. J. Scott Porter "has been informed" that the evasion is effected "by means of false certificates of age; and that this is sometimes done by substituting for a child who is over age another who is younger." In corroboration of this, the Rev. William Johnston, of Belfast, told me of a case within his knowledge in which a certain woman had a daughter who was baptized as Margaret Roger. At a very early age the child died, and subsequently the woman had another daughter, and named it likewise Margaret Roger. When this child grew to be six years old, the mother went to the clergyman and procured a certificate of the baptism of her first child, already dead. This she presented to the Inspector, and on the strength of it passed her second child into a mill two years before the legal age. Similarly, the Rev. James Canavan, a Roman Catholic clergyman in Belfast, says that the Act is "constantly violated by admission of children at too early an age." And testimony to the same effect reached me from other quarters. The blame was allowed by all to rest entirely with the parents.

Impression that law is often evaded by parents.

Testimony of clergy to this effect.

430. I found it difficult to test the accuracy of the allegations made, for the children are often quite ignorant of their own ages. I should be inclined to suspect, from my own observations, that the statements are exaggerated, though no doubt the parents do what they can to evade the law. In the infant department of Whitehouse National school the ages of several of the half-timers as entered in the school register were under the

Instance at Whitehouse.

HALF-TIME SYSTEM.

legal limit. One little girl, who certainly did not look more than seven years of age, and had been so entered in the school register, told me that when the doctor asked her how old she was, she had said "nine." She had only been a fortnight in the mill, and therefore could hardly have forgotten what had occurred.

431. Some evasions of the law are probably inevitable; but this consideration is only an additional reason for the institution of a collateral check in the form of a certificate of attainments at school.

432. I may sum up the suggestions contained in the foregoing remarks thus. What appears to be required is:—

Summary of suggestions.

1. That the age of admission to the mills should be advanced from eight years to ten.

2. That previously to admission it should be necessary for a child to produce a certificate, signed by the District Inspector of National Schools, to the effect that the child had passed his examination for the Second Book class.

3. That "school attendance" should be interpreted to mean attendance at a school specially adapted to the half-time system, and (if necessary) to which none but half-timers are admitted.

4. That the allowance of teachers should be somewhat more liberal, *e.g.*, let two-thirds or three-fourths of the half-timers be counted for average attendance, instead of only half, and the presence of the teachers be required during the whole schooltime.

5. That a clear hour should intervene between morning work at the mill and afternoon attendance at school.

433. As regards the educational regulations of the Print Works Act, I can only say that they seem to me to be so utterly inadequate that they might almost as well be abrogated altogether.

SECTION IX.—CONVENT SCHOOLS.

Four convent National schools.

434. The district assigned to me contained four convent schools in connexion with the National Board of Education. One of the convents, namely, that at Armagh, supports, besides its National school, a day-school for the middle classes of the city, and also a boarding-school, which is attended by girls from various parts of the country. These two schools are entirely independent of State control, but, with this exception, the convent schools in my district are all in connexion with the National Board. The convents at Belfast and Lurgan are occupied by Sisters of Mercy, the convent at Armagh by Sisters of the Sacred Heart.

435. I visited and examined each of the convent National schools; and as the number of them is small and their importance great, I propose to describe each of them separately, and to record the details of my examination with some minuteness, in order that you may be able to form a precise estimate of their efficiency for purposes of secular instruction. But before doing so, it may be well to notice some of the general questions which arise concerning the position of convent schools as members of a professedly non-sectarian system of National education. It is sufficiently obvious that the difference between a convent school and an ordinary National school is something more than a difference of degree; the character and object in life of their teachers, and the special regulations which the National Board find it necessary to lay down for them, mark the difference as one of kind. It is essential to the due appreciation of the educational system at present established in Ireland that this distinction should not be lost sight of, and that the idea of regarding convent schools as in any sense non-sectarian should be entirely discarded. It is unnecessary to explain *why* no Protestant children are to be found within the walls of convent schools; the very name explains the fact, and it is idle to suppose that any device of checks and precautions, however perfect, will render these schools a means of promoting the professed ends of the National Board. It is better to acknowledge at once the existence of a great anomaly, by which a system founded for the promotion of united secular instruction for Protestants and Roman Catholics alike, has extended its aid, under certain conditions, to schools which neither are nor can ever be *en rapport* with the fundamental principles upon which that system is established.

Their anomalous position in the system of National education.

Comments thereon of friends and foes to the system.

436. Naturally the abnormal position of convent schools gives rise to much comment; friends and foes alike regard them as inconsistent with the general scheme which the Commissioners of National Education have to administer. The Roman Catholics see in their recognition by the Board a partial concession to the principle of denominational education for which their hierarchy so loudly cry out. The Protestants, if friends of the National system, regret a conspicuous symptom of the lapse of the Board from their original stand point; if enemies to the system, as are the majority of the clergy of the Established Church, they quote the assistance granted to convent schools as one more proof, if proof be needed, of the bias of the system in favour of the Roman Catholic members of the community, and are confirmed in their position of isolation from the State in educational matters, by the complaint that a concession has been made to the nuns which has no counterpart in the experience of those who advocate the unrestricted use of an open Bible.

Ignorance of some of the clergy of the Established Church concerning the National system.

437. It was remarked long ago, if I recollect rightly, by Archbishop Whately, that a great deal of the opposition which the National system of education has had to encounter, has been due to culpable ignorance on the part of persons whose duty it was to inform themselves on the principles and details of its administration. This remark seems to be true even at the present day, particularly with respect to the treatment of convent schools. The attitude assumed by many of the clergy of the Established Church leaves them open to the vaguest and most inaccurate impressions concerning the working of the system. They take their stand on a sort of *non possumus* principle, and declare that they have nothing to do with and know nothing of the National system. It is not surprising, therefore, if the grossest exaggerations are heard concerning so debatable a topic as the recognition of convent schools. The following is extracted from my notes of a conversation with a rector of a country parish:—

An instance concerning convent schools.

438. "He never supported the National system, to the principles of which he objects. Concurs in the principles of the Church Education Society, and his school is in connexion with that body. Thinks, however, that politically it was a mistake on the part of the clergy of the Established Church that they did not join the National system originally. The ground of his objection to the National Board is that Protestants are not treated by them in the same way as Roman Catholics—they have not the same privileges. There is great ignorance in England about the Irish system of National education; very few Englishmen know of the system by which grants of public money are made to Roman Catholic schools free from all conditions or restrictions. 'Why you don't mean to tell me that they' (the Roman Catholics) 'are not allowed to teach their religion as and when they like?' Is confident that in a nuns' school I should find all the emblems of Romanism openly displayed. Puzzled by my statement that the books published by the National Board are used in nuns' schools, about which he was evidently incredulous; but, he added, it would not much matter as they could use their own books collaterally, and the National books might be useful to them for some things. Feels sure that these schools are free from inspection. Was going to England and should have to speak at public meetings on the system of National education in Ireland. Would not have hesitated to say what he now said, and what all the Established Church clergy believed, namely, that the Roman Catholics get money from the Board for their

schools free from all restrictions, whereas Protestants are hampered about the use of the Bible. Is not very clear whether what he had said applies to all National schools under Roman Catholic management, or only to conventual National schools. All that he is quite certain of is that the Roman Catholics got their money from the Board, and are under no obligations or restrictions in return. 'If that is not true, all I can say is, it is the universal belief among our clergy.'"

CONVENT SCHOOLS.

439. I need hardly say that convent schools are subject to precisely the same regulations regarding religious and secular instruction, and to inspection by the same officers, as are ordinary National schools. It is equally unnecessary to explain that the extract I have given represents something more than the average amount of misconception concerning the operations of the Commissioners of National Education; but the distrust which the recognition of convent schools has generated, or at any rate perpetuated, is shared by many who have taken much better care to acquaint themselves with the facts than has the reverend gentleman whom I have been quoting. In short, the convent schools give rise to precisely that kind of reflection on the National Board which may be expected to be called forth whenever a body administering public funds sanctions a payment which appears to some of its critics to be one-sided and exceptional. Therefore, in winning over to its ranks the convent schools, it must not be forgotten that the National system has given a handle to its opponents which they are ever ready to use to its disparagement and injury; the gain is not without an appreciable set-off.

The recognition of convent schools has given a handle to Protestant enemies of the National system.

440. But apart from such objections as may be raised from mere ignorance of the facts, I believe that much injury is done by a wide-spread suspicion in the minds of Protestants that the convent schools, besides being from their very nature denominational, are able to treat the regulations of the National Board, for the protection of the religious feelings of a possible minority of Protestants in attendance, with a less strict adherence than other schools. The privacy of the convent, whose precincts a Protestant never thinks of entering, naturally gives rise to a belief that, the safeguards being in part removed, compliance with obnoxious restrictions will not be very precise. It is, of course, well known that, in point of fact, there is no Protestant minority to be protected; but this assurance does little to remove the dissatisfaction which a suspicion of privileged indulgence gives rise to. Those who unwillingly see the convent schools assisted at all by the State, are exasperated if they think that the State regulations are not uniformly observed. It is, of course, impossible for me to disprove, from the experience of an official visit, the insinuations which are made concerning the irregular display of religious emblems, and the fusion of the times appointed for secular and religious instruction. But it is right that I should mention anything that I did observe which has any bearing on these matters. What I have to notice relates to the convent at Lurgan only, and touches both points of complaint.

Injury arising from suspicions of lax adherence to regulations in convent schools.

441. There is a society called the "Order of the Children of Mary," for the management of which in the diocese of Dromore printed regulations have been issued under the sanction of the Rev. Dr. Leahy, the Roman Catholic Bishop. Subordinate to this is a less formally constituted association called the "Children of the Holy Angels." In the Lurgan convent schools admission to these orders is treated as a reward, and as an incentive to good behaviour and industry. Admission to the higher order, that of the "Children of Mary," takes place through the medium of the inferior association of the "Children of the Holy Angels." The course of probation and succession is as follows:—If a child is considered to be deserving of encouragement, she may in the first instance become a candidate for admission into the association of the "Children of the Holy Angels." If she is allowed to be a candidate she wears on her right shoulder a small card, cut in the shape of a heart, and tied with a piece of green ribbon; on the card are written the words "I ——— desire to become a child of the Holy Angels." These words are surmounted by the date at which her candidature is allowed, and sometimes by a cross marked in ink. She wears this card with its green bow constantly in school, and, no doubt, the distinction is a source of pride to herself, and a stimulus to others. Before she can actually be admitted into the association of the "Children of the Holy Angels," she must pass satisfactorily through a period of probation as a candidate in the manner just explained. After her admission to the association, she exchanges her badge of candidature for a medal attached to a green ribbon which hangs round her neck. The ribbon is cut of a considerable width, and shows conspicuously. The medal bears on one side the figures of St. Joseph and a child, with the words "Ite ad Joseph" round the margin. On the reverse side is the figure of an angel with a child, and round the margin are the words "Angelis suis mandavit de te." The medal itself is of a gilt colour, and hangs in front below the bosom.

Tokens worn at the Lurgan convent. The association of "Children of the Holy Angels."

442. The order of the "Children of Mary" is a higher distinction. In this case, too, a candidate for admission wears a piece of card in the shape of a heart, with the words "I ——— desire to become a child of Mary" written on it. In this case the bow is tied with blue ribbon. After she has been admitted to the order, she wears a blue ribbon round her neck, cut in the same way as the green ribbon of the minor association, and appended to this a medal bearing the words "Congregation des Infants de Marie" on one side, and on the other a figure of the Virgin, and the words "Monstra te esse Matrem." The book containing the rules of this order was shown to me. It contains among other things, regulations for the admission and expulsion of members. Girls must be 10 years of age at admission—of good behaviour—desirous of being good, &c., &c. Expulsion is prescribed if she goes to wakes, drinkings, &c., or dances forbidden dances, or otherwise leads an unholy life.

"Children of Mary."

443. The sister in charge of the schools who after I had called attention to these tokens, readily and unreservedly explained their purport to me, and showed herself anxious that I should be put in possession of the whole truth respecting them, informed me that about a dozen of the present National school day-scholars have been admitted to different degrees under these associations; a far larger number of girls attending the evening and the Sunday school have been admitted. In all these are about 60 members or probationers in the Lurgan convent schools.

Number of children admitted to the orders.

444. During my visits, on two separate occasions to the convent, I noticed 5 girls who wore tokens of membership or candidature. Two of them wore the card and green ribbon of candidature for admission as children of the Holy Angels. Two wore the green ribbon and medal which are awarded to members after admission, and one wore the card and blue ribbon which precede admission to the order of the children of Mary. In these five cases it was impossible not to notice the tokens. The cards on the shoulder can scarcely be concealed, while the broad ribbon round the neck is equally conspicuous. When I first observed the medals hanging from the necks of two girls they were being openly displayed in front of their pinafores. When next my eyes rested on these two girls, the medals had been tucked in underneath their pinafores, and were no longer visible, though the green ribbon to which they were attached was still displayed round their necks. The sister in charge told me that the mere ribbons, and even the cards worn on the shoulder, were not emblems, and that the wearing of them was no infraction of the rules of the National Board, which prohibit the exhibition of any "emblems or symbols of a denominational character" during the period of united instruction; but she at once admitted that the medals came within the scope of the prohibition, and that they ought to be worn under a shawl or pinafore. She accounted for the small number of tokens which I had observed by saying that others wore them, as they ought to do, under some covering.

Five girls wore tokens visible on occasion of visit.

Frank explanation by the sister in charge.

CONVENT SCHOOOL.

These tokens would be objectionable in a mixed school.

445. I am not aware whether the Board of National Education has ever attempted to define what are "emblems or symbols of a denominational character." These badges are tokens of membership or probationership in a society of a strictly denominational kind, and only by a very nice distinction can they be regarded as beyond the reach of the words in the rule. At any rate, if there were Protestant children attending the school—and this is the real test—these tokens would be calculated to give rise to differences; for even if they were allowed to be not contrary to the intention of the rule, they are tokens of an exclusive character, which Roman Catholics would enjoy, and for which Protestants would not be eligible. Therefore, harmless and useful as these tokens may be in a convent school, they none the less appear to me to be inconsistent with the spirit of the National system.

Distinction between times for secular and religious instruction.

446. On the subject of the observance or non-observance of the rules of the Board, with reference to the distinction between religious and secular instruction, it would be clearly impossible for me to adduce any direct evidence gathered on the occasion of an official visit. But even within the limits allowed by the rules of the National Board, there is room for much that is inconsistent with the effectual working of a mixed school.

The intermediate prayer.

447. Thus the rules allow religious instruction to be given at three times in the day at most; that is to say, there may be religious instruction or prayer at the commencement, and at the close of the school-day, and at one intermediate time. In the Lurgan convent school, strictly in accordance with the regulations, there are prayers from 9.55 to 10, A.M., that is, at the commencement of school; religious instruction (consisting of preparation for the sacraments, catechism, and prayers) from 2.15 to 2.45, P.M., when school closes, and from 12 to 12.5 prayers only are said. On the day of my examination the regular course was adhered to, and at noon the notice "religious instruction" was exhibited for a few minutes, during which the "Angelus" was repeated, and as soon as it was over the secular work went on as before. Now in this there is nothing whatever to be objected to if convent schools are regarded as denominational institutions; but if the fiction of mixed education is to be preserved in them, then this permission to break in upon the ordinary school work with a prayer is obviously objectionable. If there were half a dozen Protestant girls in attendance, the rules would require that at 12 o'clock they should leave the room to be re-admitted at five minutes past 12, and this would cause discomfort and inconvenience to all.

Requirement that secular books be laid aside at religious observances.

448. Moreover, the obvious intention of the Rules of the National Board is that there should be a complete separation, in time and circumstance, between periods of religious and of secular instruction. "Whether the religious or the secular instruction shall have priority in any National school, the books used for the instruction first in order shall be laid aside at its termination, in the press or other place appropriated for keeping the school books." And again, "No secular instruction, whether literary or industrial, shall be carried on in the same apartment during school hours simultaneously with religious instruction." But it would be monstrous to exact a precise compliance with these regulations for the purpose of a short intermediate prayer. The collecting and laying aside of the secular books "in the press or other place" before the prayer was said, and their redistribution afterwards, would, in effect, turn a five minutes' interlude into a twenty minutes' loss.

Direct internal communication between school and convent.

449. Again, one of the Rules of the National Board prescribes that "When a school-room is in any way connected with a place of worship there must not be any *direct internal* communication between the school-room and such place of worship;" the presumable intention of which is to remove the temptation which would otherwise exist to withdraw a class at irregular times for special instruction in religion to a place which is independent of the control of the Board. But in the case of a convent school, the very effect which it is sought to prevent in ordinary National schools, is actually produced. There is no prohibition of direct internal communication between the school and the convent, and the room adjoining the school may be fitted up with religious emblems and used practically as a sort of chapel over which the Board exercises no control. Something of this kind is done at the Lurgan convent, where the door communicating with one of the chief school-rooms leads into a class-room, which is explained to be not under the Board, and in which, accordingly, there is a free display of religious emblems. The Armagh convent, and that in the Crumlin-road, Belfast, are buildings quite separate from the schools.

These matters trivial as convent schools are, but significant in a non-sectarian system.

450. The matters to which I have just been calling attention may appear to some to be trivial, and to mention them at all may look like captious fault-finding. What more natural, it may be asked, than that the convents should avail themselves of all that the strict letter of the rules permit in the way of denominationalism? What harm can be done to Roman Catholic children by little tokens which are awarded to them for good behaviour? Who would grudge them a five minutes' prayer at mid-day? What if a class can at any moment be withdrawn without disturbing the rest of the school, into a separate apartment, which does not happen to be part of the "school-room," in the strict sense of the word? It is because all this may appear so natural and reasonable and harmless—if we take the convent schools as they are—that is, as practically exclusive schools—it is for this very reason that these matters are suggestive of very grave conclusions. The entire scheme of National education in Ireland was framed on the basis of "united" instruction in secular subjects. Certain rules are laid down on that general basis, as being best fitted to secure for all complete exemption from religious interference. Certain schools are admitted into the system, which have started from a point inconsistent with the idea of "united" secular teaching. And yet the attempt is made to keep up the fiction of a possible mixture of denominations by the enforcement of rules which, if there is no minority to be protected, appear irksome, unnecessary, and even injurious. If there were but two or three Protestant children in each convent school their presence would constantly keep before the minds of the teachers the object and purpose of the restrictions which the National Board imposes. But if no Protestant child ever attends, the perception of the reasons which actuate the Board in their restrictions becomes blunted; it is felt that the whole object of the restrictions is to preserve the rights of conscience, and here there can be no rights of conscience to preserve. The case I mentioned just now of the short intermediate prayer at noon will illustrate this point. If there were Protestant children in the school inconvenience would be felt directly. To pick out the Protestants, and send them for five minutes out of the room, would be at once painful to those particular children and a cause of disturbance to the whole school. The practice would, probably, on that account, be discontinued; indeed there is a provision made to meet such a case in the rules of the Board, one of which says that the Commissioners "will not sanction any arrangement for religious instruction, prayer, or other religious exercises *at an intermediate time*, in cases where it shall appear to them that such arrangement will interfere with the usefulness of the school by preventing children of any religious denomination from availing themselves of its advantages, or by subjecting those in attendance to any practical inconvenience." As matters are, not only is there no practical inconvenience arising from the mid-day prayer, but there would be no practical inconvenience in having a prayer every hour of the day, as is done in the schools of the Christian Brothers. But the sentiment which ought to be at the bottom of compliance with the restrictions imposed is taken away, and the only actuating motive is a feeling of necessary subserviency to the Board. Instead of acting continually on the principle of respecting the conscientious scruples of neighbours who differ from them in religion—instead of endeavouring to use the liberty which the Board allows, so as to adapt the school as nicely as possible to the convenience of conflicting

CONVENT SCHOOLS.

interests, the managers of convent schools have but one set of interests to regard, and whatever liberty of action is allowed by the Board is strained to the uttermost in the direction of denominationalism, with no other check than the fear of passing beyond the limits prescribed.

451. Theory and practice are, in fact, in direct antagonism, and the convent schools are attached to the National system only by an unnatural and insincere allegiance.

Special regulations affecting convent schools.

452. II. I pass on to notice briefly the working of certain special regulations of the National Board relative to convent schools. The chief points of difference are:—

453. (1). The nuns alone of all teachers recognised by the Board are exempted from any test of their competency to act as teachers.

(1.) The nuns not examined.

454. The policy of their exemption is to be measured mainly by their actual success with their schools. I therefore leave the point for the present, and will refer to it in my general conclusions, after I have recorded the results of my examinations of the children.

(2.) No "assistant teachers" allowed.

455. (2). No "assistant teachers" are allowed to convent schools; to monitresses the regular salaries are granted. This restriction was urged by the nuns at the two Belfast convents as a very great hardship, and forms a leading topic in the complaints which they are very ready to urge against the Commissioners of National Education.

Complaint of the nuns at Belfast.

456. I do not see on what grounds of fairness this demand for assistants is made, seeing that the nuns themselves form a body which practically supplies principal and assistant teachers, nor was this complaint of the nuns of Belfast supported by the conversations I held with the nuns at Armagh and Lurgan. At Armagh, where the question was discussed at some length, the desire expressed took a very much milder and as it seems to me a very reasonable form. The ladies at this convent spoke of the National Board in terms of respect and good feeling. They disclaimed any desire to find fault with its mode of dealing with themselves. They considered that the Board treats them with exceptional indulgence in excusing them from examination, and in return it is but fair that they should make some concession to the Board, and the concession they have to make is to be denied the aid of paid assistants and to be allowed payment for monitresses only. But they argued, the Board has in this arrangement thought only of the nuns and not of the monitresses. For the monitresses, say they, it is a great hardship, that after they have served the allotted time in that capacity they must of necessity leave the convent school to become assistants elsewhere. Many of them are greatly attached to the school, to the nuns, and to the children, and would gladly stay if they might, even without increase of salary. But they are not suffered by the rules to extend the period allowed to them as monitresses; they are bound to go forward, and to go forward means to leave the convent school and become assistants elsewhere.

Case of the monitresses, as urged by the nuns at Armagh.

Injury caused by rapid succession of monitresses.

457. Besides this it was urged that great injury is done to the school itself by the frequent changes in the teaching staff which this rule necessitates. Mere girls are being constantly enlisted to take the places of young women who have become experienced teachers. Three monitresses had left the Armagh Convent school between January, 1867, and the date of my visit, October 12, 1868, and the trouble occasioned by the changes and the difficulty of procuring suitable substitutes were so great that the reverend mother sometimes thought of declining the aid of monitresses altogether, and supplying their places with more nuns.

They might be suffered to stay on as monitresses after their time is up.

458. To remedy all this, the nuns at Armagh ask that they may be allowed to retain their monitresses as long as they like. They do not ask to be allowed a staff of assistants as other schools have; but if they have got a really good monitress, whose presence is valuable to the school, they would wish that it should be possible for them to retain her; and they are confident that even without increase of salary they would be able to retain their best monitresses through the mere force of attachment and devotion. A relaxation of the rules to this extent would, as it appears to me, be beneficial to the schools, and it would entail no additional expense on the administration.

(3.) Payment to nuns on average attendance only, without regard to efficiency or number of nuns teaching.

459. (3). The form of payment made to the nuns requires a few words. Instead of salaries to the several teachers a payment is made *pro ratâ* according to the average number of children in attendance. In other words, the payment is made entirely without regard to the efficiency or inefficiency of the several schools. In ordinary National schools the rate of salary depends primarily upon the teacher's classification, which presumably represents his relative competency to teach. In the convent schools it follows from the exemption which is granted to the nuns from all tests of competency, that no distinction can be drawn between a convent which teaches well and one which teaches badly. It is assumed, in fact, that all convent schools are equally deserving. Moreover the payment is made without regard to the number of nuns who teach, and the consequence is that if the payment be regarded in the light of salary to be distributed among the teachers, the proportions are most unequal. For instance, there are but two nuns who teach at the Hamilton-street Convent School in Belfast. There were 333 children in attendance on the second day of my visit, or 166·5 children to one nun. Supposing the number present on that day to be the average daily attendance, the yearly allowance made to these two nuns would be £64 5*s.*, or £32 2*s.* 6*d.* apiece.

57 children to each nun in Crumlin-road, 166 to one in Hamilton-st.

460. Compare this with the Crumlin-road Convent School in Belfast. There are eight Sisters who teach in the day-school. There were present 457 children, or 57 children to each nun. If 457 were the daily average attendance, the grant for the year would be £89 15*s.*, or £11 4*s.* 4½*d.* to each nun. Then, as far as concerns "salary"—for so it is described in the official phraseology—the rate allowed is in the inverse ratio to the presumable efficiency of the school. Of course I am aware that the nuns do not consider the grant made to them in the light of a salary. Their work is a work of love, and they do not count the pecuniary gain as their object in teaching. The nuns in the Crumlin-road would regard it as no wrong that while they receive about £11 apiece, their sisters in Hamilton-street receive £32. But this is to treat the question from the convent's point of view, and not from that of the public good. The public may fairly say that if 57 children to each nun is a right proportion in the Crumlin-road, 166 to 1 cannot be right in Hamilton-street.

The nuns receive their salaries for general purposes of the convents. Objection on this ground in the minds of some.

461. I may mention here, that the fact of the nuns accepting the State grant not for themselves individually but for the general purposes of their convents was sometimes urged by those who object to the principle of convent National schools as a special ground of complaint against them. It was represented that the grant is neither more nor less than a subsidy from the public purse in support of monastic institutions. The allegation is, no doubt, literally true. Even the fees paid by the children are likewise devoted to general purposes. But, if it be once allowed that convent schools can be recognised as places of National education, the payment follows as a matter of course, and no one has any right to inquire whether the nuns do or do not devote the funds they earn to specific or general purposes. The question is, in fact, only part of the general question concerning the propriety of recognising convent schools for the purposes of National education, and I only allude to it because it seemed to be a special stumbling block in the minds of some persons whom I met.

462. I now proceed to notice the state of secular teaching in each of the four convent schools separately.

CONVENT SCHOOLS.

I.—*The Crumlin-road Convent National School, Belfast.*

463. The convent occupies a favourable site in one of the most airy and healthy quarters of the town. By the kindness of the lady superior I was permitted to view the interior of the building, the chapel, the refectory, the cells, &c.

The school building.

464. The school is a separate building within the same general precincts. It consists of two wings, each containing three large and well-appointed rooms. One of these rooms is used for the infants, another for girls in the First Reading Book, the next for the use of the Second Book, the fourth for those in the Third and Fourth Books; the fifth is for the monitresses; the sixth is called the museum—it contains a small collection of specimens from nature, and is accessible as an extra room for general purposes. There is also a small class-room.

Children in attendance.

465. The accommodation is on the whole ample for the large number of girls who attend. There were 710 names on the rolls at the time of my visit; and the numbers in attendance in the several rooms, on the several days of my examination (September 1st, 2nd, and 3rd), composed an aggregate of 457, or 64·3 per cent. of the whole number on the books.

Record of examination.

466. The following is a *resumé* of the examination in the several rooms. By the term "per-centage mark" gained in any subject, I mean to represent, as in my remarks under the head of "Secular Instruction," the proportion of marks gained by the whole class under consideration in any particular subject; the standard of marks, if each girl obtained full marks, being 100.

Teaching staff.

467. The teaching staff consists of 8 nuns, 9 paid monitresses, of whom 1 is a "first class" monitress, and 10 unpaid monitresses—girls in the Fourth Reading Book. A singing mistress also attends.

(1.) Infant school.

468. (1.) *Infant School.*—Present, 210; taught by 2 nuns and 4 unpaid monitresses. Highest draft of 17, in First Book, read well; are learning easy addition tables; and some write in copy-books; sing nicely; order, quite satisfactory.

(2.) First Book room.

469. (2.) *First Book Room.*—Present, 86. These not distinguished in the books from the infants. Together they give 296 present out of 448 on rolls, or 66·0 per cent. Taught by 1 nun, 1 paid monitress (usually 2), and 3 unpaid monitresses. Divided into drafts of 11 to 18 in number. Lowest draft of 15 far behind highest draft in infants' room; but older (up to 9 years). Intermediate drafts, ages up to 10 and 11 years, not in advance of infants' room. Highest draft of 11 girls, ages from 7 to 9 years, read satisfactorily; have learned a very little geography (none knew the capital town of England); with 2 very simple addition sums, 12 out of the 22 sums were correct (per-centage mark, therefore, 54·5). Five girls had copy-books. On the whole this draft fairly forward; rest very backward.

(3.) Second Book room.

470. (3.) *Second Book Room.*—Present, 94 out of 154 on roll, or 61·0 per cent. Taught by 2 nuns, 3 paid and 2 unpaid monitresses. Divided into senior and junior divisions. In junior division, examined by a specimen draft of 22 drawn equally from upper and lower portions; average age was 8½ years. Per-centage marks:—reading, 59; arithmetic (simple addition and subtraction), 33; spelling, fair. In senior division, average age 9¾ years; per-centage marks—reading, 54; arithmetic (simple addition, subtraction, and multiplication), 64. In dictation (2½ lines, easy, from Second Book), words misspelt ranged from none (2 girls) to 10; average, 2·4 in each exercise. Most write in copy-books, but these very unsatisfactory. On the whole—reading, poor; arithmetic, good only in top girls; writing, bad.

(4.) Third and Fourth Books room.

471. (4.) *Third and Fourth Books Room.*—Present, in Third Book, 48 out of 83 on roll, or 57·8 per cent. In Fourth Book, 19 out of 25, or 76·0 per cent. Teaching staff, 2 nuns for this room only (aided by a third nun, who also assists in any other room where help is needed, and by one of those attached specially to the infants' room), and four paid monitresses.

472. Third Book class; divided into three divisions; a draft examined from each division separately, with results as follows:—

Division.	Number examined.	Ages.	Average age.	Per-centage Marks.			Test employed in Arithmetic.
				Reading.	Writing.	Arithmetic.	
Lowest, . .	19	8 to 13	10¼	69	—	67	Simple rules.
Intermediate, .	12	8¾ to 16¼	11½	64	48	41	Simple rules and compound addition.
Highest, . .	15	9 to 13	12	83	66	60	Compound rules.

Dictation was pretty fair in the two lower divisions; averaging about 1 word misspelt in every 2 lines of print from Third Book. In the highest division, with 4½ lines of Third Book, 5 girls quite correct; average 2 mistakes apiece. English grammar and geography, poor in lower divisions. In highest division—geography, good; grammar, beyond naming parts of speech to which words belong, weak.

473. Fourth Book class—In two divisions; upper consisting of unpaid monitresses. Their examination gave the following results:—

Division.	Number examined.	Ages.	Average age.	Per-centage Marks.			Test employed in Arithmetic.
				Reading.	Writing.	Arithmetic.	
Lower, . . .	6	12 to 18¼	13⅞	77	70	50	Simple and compound rules.
Upper (monitresses),	9	12 to 16	13½	88	80	72	Simple and compound rules.

474. In 5 lines dictated from the Fourth Book the lower division had no exercise free from errors; average, 3 words misspelt in each. Upper division wrote 4½ lines, rather difficult, with average of one mistake apiece; two quite correct.

475. Geography and grammar in lower division unsatisfactory, especially the grammar; in upper division both satisfactory.

General.

476. On the whole—the Third Book class satisfactory in reading, poor in writing, grammar, and geography; not forward in arithmetic; fair in dictation. The Fourth Book class, in lower division, bad in arithmetic, and only satisfactory in reading and writing; in the upper division a very marked improvement, the class being throughout intelligent; their reading and especially their writing very good.

II.—*Hamilton-street Convent National School, Belfast.*

477. Three members of the Sisterhood of Mercy occupy an ordinary private house in Hamilton-street, adjoining the school building. The house is not permanently devoted to conventual purposes, but is rented by the Sisters at £50 a year.

The school building.

478. There is one large school-room (58 ft. × 21 ft.), one smaller room (23 ft. × 20 ft.) in which the infants are taught, and a third room, forming part of the house or convent, but accessible only from the school, is used as a music-room, and for the monitresses. The area of the two school-rooms would accommodate, at 8 square feet per child, 210 children. The number on the rolls at the time of my visit was 468, of whom 272 were present on Friday, August 28th (market day), and 333 on Monday, August 31st, or 71 per cent. of the whole number. The rooms are consequently inconveniently crowded.

Teaching staff.

479. The teaching staff consists of two nuns and eight paid monitresses, of whom two are "first-class" monitresses, besides a workmistress, and a singing-master. The girls in the fourth class act as unpaid monitresses.

480. (1). *First Book Class.*—Reading and elementary arithmetic much the same as at Crumlin-road; writing somewhat better. Ages up to 10 years.

481. (2). *Second Book Class.*—In two drafts; reading in upper draft satisfactory, in lower draft backward. Sums in simple addition and subtraction, per-centage mark of the whole class 61. Spelling in upper draft pretty good. Writing tolerable. Ages from 7 to 12½ years.

482. (3). *Third Book Class.*—Highest draft of 19 girls.

Number examined.	Ages.	Average Age.	Per-centage Marks. Reading.	Writing.	Arithmetic.	
19	9 to 13	10¾	63	66	56	(Simple rules and compound addition.)

483. This may be compared with the corresponding drafts at Crumlin-road. In dictation this class wrote the same 4½ lines which were dictated to the highest draft of the Third Book class at Crumlin-road; one girl made no mistake, one (aged 13), made as many as 11; average, 4·5 words misspelt in each exercise. English grammar bad, the wildest guesses made as to parts of speech of words. Geography fair.

484. (4). *Monitresses' Class.*—Ten girls, aged from 12¼ to 16 years, average age 13¼. Far inferior to the corresponding class at Crumlin-road. Copy-books wanting in neatness and cleanliness; per-centage mark in arithmetic (compound rules) only 55. In three easy lines of prose from Third Book, two exercises only quite correct. One girl, aged 13, had 7 mistakes, and the average gave 2·6 words misspelt in each exercise.

III. *Lurgan Convent National Schools.*

485. The convent at Lurgan supports three distinct departments, all under the National Board, viz., an infant school (for poor children), a school called "St. Mary's" for poor girls, and a school called "St. Joseph's" for girls of a higher social class. But so far as the connexion with the National Board is concerned the three schools are regarded as one.

486. The girls in St. Joseph's are chiefly daughters of tradespeople in Lurgan. They pay 2*s.* 6*d.* or 5*s.* a quarter, and the room in which they are taught is quite separate, and approached by an entirely different route from that by which the girls of St. Mary's are admitted to their school. They are taught by two nuns, and two paid monitresses.

487. In St. Mary's the girls are of the usual National school class, and pay, if anything, 1*d.* a week. They are taught by two nuns, a first class monitress and another paid monitress.

488. The infant school is preparatory to St. Mary's only, and the fee is, if anything, 1*d.* a week. The teachers are one nun, one monitress paid by the National Board, and one monitress paid by the convent. This second monitress was paid by the Board until the time arrived when she would in the regular course have been examined with a view to an appointment elsewhere as an assistant; for by the rules of the system she would not be allowed to remain as a monitress beyond the appointed period, and as an assistant she would not be paid in a convent school. The nuns preferring to retain her at any price, pay her themselves.

489. I examined every girl present in the second, third, and fourth classes, and some also in the first. I took the corresponding classes of the St. Joseph's and St. Mary's together, so as to test their relative proficiency throughout.

490. The state of the roll and the attendance were as follow:—

Class.	St. Joseph's. Roll.	St. Joseph's. Present.	St. Mary's. Roll.	St. Mary's. Present.	Infants. Roll.	Infants. Present.
First Book,	20	19	49	21	188	97
Second Book,	8	7	43	22	—	—
Third Book,	9	8	8	5	—	—
Fourth Book,	8	4	3	3	—	—
Totals,	45	38	103	51	188	97

In all 336 on the roll, of whom 186 present, or 55·3 per cent. Separately, 84 per cent. in attendance in St. Joseph's, and only about half in St. Mary's.

491. (1). The children in the First Book presented no feature calling for special notice; most of the St. Joseph's girls had copy-books, and St. Mary's girls had none. This was the chief difference.

492. (2). *Second Book Classes.*—Present 7 in St. Joseph's, 22 in St. Mary's, the latter in two divisions, of which the lower examined together with the St. Joseph's class.

Division.	Number Examined.	Ages.	Average Age.	Per-centage Marks. Reading.	Writing.	Arithmetic.	Test employed in Arithmetic.
St. Joseph's (all)	7	8¾ to 14	11¼	60	41	39	Simple addition and subtraction.
St. Mary's (lower)	10	7 to 12½	9¾	46	40	57	Simple addition, only.
St, Mary's (upper)	12	9½ to 13¼	11¼	76	43	54	Simple addition, subtraction, and multiplication.

Only two of the St. Joseph's girls did a sum quite correctly; they were extremely backward. Writing of all very unsatisfactory.

493. (3). *Third Book Classes.*—Present 8 girls of St. Joseph's, and 5 of St. Mary's.

	Number Examined.	Ages	Average Age.	Per-centage Marks. Reading.	Writing.	Arithmetic.	Test employed in Arithmetic.
St. Joseph's,	8	9 to 15¾	11⅞	70	58	41	Simple rules and compound addition.
St. Mary's	5	9 to 13¼	11⅛	66	50	20	

The arithmetic of the St. Mary's girls very bad, as also their dictation; in 4½ lines from Third Book two had seven mistakes each, one 8, and one aged 13¼ had 13.* The St. Joseph's girls misspelt on an average 4 words apiece. English grammar in St. Joseph's was mere guesswork; in St. Mary's far better, in fact just satisfactory.

494. (4). *Fourth Book Classes.*—Present 4 girls of St. Joseph's, 3 of St. Mary's.

	Number Examined.	Ages.	Average Age.	Per-centage Marks. Reading.	Writing.	Arithmetic.	Test employed in Arithmetic.
St. Joseph's	4	10 to 15¼	13¼	83	75	65	Simple and compound rules, and simple proportion.
St. Mary's (monitresses),	3	9½ to 11½	10¾	100	55	50	

* This girl wrote as follows:—
This on fortnut man had not laying loud quit in the cavrin before he herd a dreadfull nois witch fritned him very mutch and seemed to be the rower of some wild beast he started up with a desine to escape.

CONVENT SCHOOLS.

495. In dictation, 5½ lines from Third Book, two girls in each class were without mistake, and the rest had 1 or 2 mistakes each. English grammar was very respectable, geography (including physical) satisfactory. The whole of these two classes were intelligent, and considering the age of St. Mary's girls they did as well as those of St. Joseph's, though neither their writing nor their arithmetic were at all satisfactory for monitresses.

496. Considering their relative ages I do not think the St. Mary's girls can be said to be at all inferior to those in St. Joseph's. It is to be noticed in St. Mary's that the oldest class is in the Second Book, and that the Fourth Book class is younger also than the Third Book class. The greater regularity of attendance in St. Joseph's may account for the more regular gradation of ages in that school.

Social distinction between St. Joseph's and St. Mary's schools.

497. The social distinction drawn at this school between St. Joseph's and St. Mary's departments is unique in my experience of National schools in Ireland. It might be expected that the advantages of more cultivated associations at home, and more regular attendance at school, would place the St. Joseph's girls not only far in advance of the St. Mary's girls, but in advance also of girls at any ordinary National school. I find no such result, however. The girls in St. Mary's are, for their years, as well advanced as those in St. Joseph's, and for the purpose of comparison with an ordinary National school, I shall not be applying too severe a test if I place side by side, the performances of the Second Book class of St. Joseph's, the upper draft of the Second Book class in the girls' department at Hunter's-lane National school, in Donaghadee, and of the Second class (third from the top) at Kilmore (Erasmus Smith's) girls' school :—

Comparison with two other girls' schools.

Second Class at	Number examined.	Ages.	Average age.	Per-centage Marks. Reading.	Writing.	Arithmetic.	Test employed in Arithmetic.
St. Joseph's, . . .	7	8¾ to 14	11¼	60	41	39	Simple addition and subtraction.
Donaghadee, . . .	12	7 to 10¾	9	95	58	66	
Kilmore Church School,	12	8 to 10	8⅞	80	66	76	Simple addition, subtraction, and multiplication.

Or again, in the Third Book class, if I compare the work done at St. Joseph's with that at Dundonald (girls') National school, situated in a small village in the county Down.

Third Class at	Number examined.	Ages.	Average age.	Per-centage Marks. Reading.	Writing.	Arithmetic.	Test employed in Arithmetic.
St. Joseph's, . . .	8	9 to 15¾	11⅞	70	58	41	Simple rules and compound addition.
Dundonald, . . .	9	9 to 12½	10¾	77	74	73	Simple and compound rules, *and simple proportion.*

In English grammar and in dictation, the girls at Dundonald were very much superior to those at St. Joseph's; the difference in dictation is as 2 to 1 in the words misspelt *in the same passage.*

IV. *Armagh Convent National School.*

Children in attendance.

498. The children who attend this school are of very poor parentage ; the fee is but a penny a week throughout the school, and very few pay even this. On the day of my visit, which was a Monday, and therefore pay day, there were 124 children present in the infant school, and 78 in the upper school, or 202 in all. The produce of the fee should therefore have been 16*s.* 10*d.*, but the amount actually paid was only 3*s.*, and this was explained to be about the average weekly receipt.

The "day school."

499. Children of tradespeople in the city are sent chiefly to the convent "day school," in which the fee is 10*s.* a quarter, and where French is taught. This school deprives the National school of that class of pupils who compose the St. Joseph's department at Lurgan.

Nuns of the Sacred Heart.

500. The nuns of the Sacred Heart do not usually devote themselves to the education of the poor at all. Their primary object, as the reverend mother explained to me, has always been the education of girls of the better class. The order was instituted in France soon after the Revolution, for the special purpose of counteracting infidel tendencies, and the middle and upper classes of society were chosen originally as their sphere of labour. Here in Armagh the principal object of the sisterhood is to carry on their day and boarding schools, but in consequence of the state of destitution and ignorance in which the Roman Catholic poor of the city were said to lie, the Sisters took upon themselves the additional work of primary education under the National Board. Accordingly, out of a sisterhood numbering thirty-six nuns, four are regular teachers in the National school, and a fifth acts as singing mistress. The whole teaching staff consists of the four nuns and four paid monitresses, besides the singing mistress and unpaid monitresses.

501. I examined all but a few very young girls in the upper school, and also inspected the infant school.

Infant school.

502. The most noticeable fact in the infant school was the presence of several girls of eleven years of age, who had come in a state of complete ignorance, and were therefore classed with little girls learning their letters. In no other convent school was there so large an admixture of advanced ignorance. None of the infants wrote on paper ; half of them learn sewing, and the best of them are learning easy addition on the black board.

Second Book class.

503. The lower part of the upper school consisted of a large class reading the Second Book. To eighteen girls taken promiscuously from the lower drafts of this class, I propounded a very simple addition sum of three lines, with three figures in each line. Out of the eighteen four only were right. There were only three copybooks in use among them, and their reading was not satisfactory. Their ages were from five to nine years.

504. In nineteen other girls, including the sixteen best girls of this class, the ages ranged from seven to fourteen years, the average age being ten years. The reading of half this class was passable, of the rest bad. The per-centage mark of the whole class was only 51. The copybooks, of which the class possessed eleven, were without exception bad and mostly dirty—among the worst I have seen in any National school. In arithmetic nine girls had not learnt simple subtraction. The rest professed to be learning it. I gave first an addition sum of four lines, with three figures in each line, and then a subtraction sum with six figures in either line, which was to be an addition sum for those who could not subtract. Seven girls out of the nineteen, did no sum right ; only two did both sums right, and these did not attempt to subtract. The ten subtraction sums that were done were all wrong. The class, as a whole, was in an exceedingly backward condition.

Third Book class.

505. In the Third Book class of twelve girls the average age was 12¼ years, the youngest girl was 9¼, the eldest 16. The reading was bad (per-centage mark 43) ; their writing bad (per-centage mark 35) ; their English grammar backward. In arithmetic only two girls professed to be out of the simple rules. I gave the class—

(1). A sum in simple addition.
(2). „ „ simple subtraction.
(3). „ „ simple division by 7.
(4). „ „ simple multiplication by 8.

CONVENT SCHOOLS.

506. My sums were never long ones. Two girls in lieu of question (4) took a compound multiplication sum. The result was that 6 girls, or half the class, aged respectively 16, 12, 11, 9¼, 14, and 14, did no one of the sums correctly. The remaining 6 girls did 10 sums correctly among them. Even after making the allowance I always did for sums only slightly wrong, the per-centage mark of the class was but 27. I also gave them four and a half lines from the Third Book for dictation. A girl, aged 14, had 12 mistakes; the work of another, aged 14, was unintelligible and worthless; another, aged 14½, had 9 mistakes; two girls, aged 11 each, had 10 mistakes each, and so on. The best exercise was by a girl of 12 years, and had 4 mistakes. The average gave 8 mistakes for each exercise, besides one absolutely unintelligible. As a contrast to this I may mention that at Kircubbin National School I dictated the very same passage to the Third Book class, and that more than half the girls in the class (4 out of 7) wrote it out without an error, and on an average they were more than a year younger than the girls at the convent school. To speak of it as a whole this class was one of the most unsatisfactory throughout that I met with in any National school.

Fourth Book class.

507. The Fourth Book class contained 12 girls, aged from 10 to 14 years; the average age was 12½ years. Their reading and writing were just tolerable (per-centage marks, 71 and 62, respectively). In arithmetic they had the same sums as the Third Class, excepting that in lieu of (4) I gave them a sum in compound multiplication by 27. This, of course is to assume a very low test for a Fourth Book class. Nevertheless, two girls, aged 12¾ and 12, respectively, failed to do a single sum correctly. Half the class did not even do the sum in simple addition, and no less than 8 girls out of the 12 failed in simple subtraction. The per-centage mark even on this very low test was but 43 for the whole class. In notation they were very deficient. And these girls act as unpaid monitresses. This class may be instructively compared with the corresponding class at Kilmore Church school.

Comparison with another girls' school.

	Number of Girls in attendance.	Number of Girls in highest Class.	Average age in highest Class.	Per-centage Marks in Reading.	Writing.	Arithmetic.	Test employed in Arithmetic.
Armagh Convent School,	78 (besides infants).	16 (of whom 12 examined).	12½	71	61	42	Simple and Compound Rules.
Kilmore Church School,	76	16	12¼	88	87	72	Simple and Compound Rules and Proportion.

And in passages of about equal difficulty dictated to them the class at the convent school misspelt on an average two words in each line of print; that at the church school misspelt one word in every two lines of print.

General comparison of convent schools with other girls' schools.

508. I conclude this record of my examination of convent schools by setting out for comparison the results I obtained at girls' schools of different kinds. I have only introduced schools, or departments of schools, appropriated to girls alone, and in which the teachers are females. Among the ordinary National schools I include good, bad, and indifferent. Under the first head, relating to Fourth Book classes, I add specimens from four of the better Church schools. Below the highest class the arrangement of a Church school does not tally accurately enough with that of a National school to admit of a satisfactory comparison.

School and Class.	Number Examined.	Ages.	Average Age.	Per-centage Marks in Reading.	Writing.	Arithmetic	Test employed in Arithmetic.
FOURTH OR HIGHEST CLASSES.							
1. *Four Convent Schools:*							
Armagh,	12	10–14	12½	71	61	42	Simple & Compound Rules.

Averages,	–	–	9½	63	39	57	

Conclusions drawn from this comparison.

509. These figures establish to my mind the following conclusions:—

1. That the best classes in the best convent schools fall short of the standard attained in the best ordinary National schools for girls.
2. That on the average the convent schools fall even below the average standard attained by ordinary National schools for girls.
3. That the most noticeable failing in the highest classes at convent schools lies in their arithmetic.

510. As between the several convent schools themselves, the highest development is attained at Crumlin-road school, Belfast. Decidedly the worst results were shown at Armagh, where, however, the girls belong to an exceptionally poor class, such as, I should think, is scarcely to be found in Belfast.

Rivalry between convent and model schools

511. Before quitting the subject of convent schools I would say a word on the special functions which they are now taking upon themselves as competitors with the National model schools. In Armagh there is no model school, and the convent school there has no other rival than the female National school, which it does much to weaken and impoverish. But in Belfast and Lurgan there are model schools both of which are under competition on the part of the convents.

512. It will be seen from what has been already said that, from an educational point of view, the convent schools do not in point of fact hold their own even against the best ordinary National schools; still less, I should presume, can they be regarded as adequate substitutes for the model schools. Their pretensions to acquire the position of denominational model schools have arisen not from dissatisfaction with the secular teaching given at the State schools, but from political and religious motives. There seems to be a general consensus on the part of persons of all creeds so far as regards the relative efficiency of the model schools for secular instruction; and although the nuns at Belfast evince the keenest spirit of jealousy and competition, their remarks always took the form of complaints that they themselves were working at a comparative disadvantage and involved no disparagement of their rival's merits. It is, indeed, not to be expected that the nuns, however enthusiastically devoted to their labours, could produce results equal in the aggregate to those shown at the model schools which are in every way the most favoured members of the National system; and I cannot doubt that the Commissioners of National Education are well aware of the state of the case. Nevertheless, the Board now displays the utmost readiness to promote this rivalry of their own model schools. In Belfast, where the population is so large, the matter is less noticeable, because there are numerous other National schools there under Roman Catholic management, and the convent schools might be regarded as no more than fresh extensions of the means of education to meet the rapidly-increasing demand of the population. But it is otherwise at Lurgan, a town of only some 10,000 inhabitants, of whom the majority are Protestants.

encouraged by the National Board.

Case at Lurgan.

513. The Lurgan Model School was opened on the 2nd day of March, 1863, and a large number of children of all denominations were entered on its rolls. During the twelve months preceding August, 1866, there were entered on the rolls—

CONVENT SCHOOLS.

Entries on rolls of model school during first year of its existence.

	Established Church.	Roman Catholic	Presbyterian.	Others.	Total.
Boys' school,	167	64	75	32	338
Girls' ,,	68	29	65	23	185
Infant ,,	76	24	40	15	155
Total,	311	117	180	70	678

514. Of the whole number, 678, there were 117 Roman Catholics, or 17·2 per cent.; of the 185 girls, there were 29, or 15·6 per cent. who were Roman Catholics. The members of the Established Church are the most numerous religious body in the town; next to them in number, and at no great interval, are the Roman Catholics, who are estimated to be about twice as numerous as the Presbyterians. It is clear, therefore, that though the Roman Catholic body did not at that time patronize the model school in such large proportions as the members of other religious bodies; still the number of Roman Catholics on the rolls was not in itself inconsiderable.

515. On the 27th of August, 1866, the convent school was opened, and in the last quarter of the present year (1868) the number of children on the roll of the model school for that quarter only (not for the whole twelve months, as in the statistics given above) was—

Present state of the rolls.

	Established Church.	Roman Catholic.	Presbyterian.	Others.	Total.
Boys' school,	110	12	44	17	183
Girls' ,,	43	3	29	20	95
Infant ,,	60	4	30	7	101
Total,	213	19	103	44	379

That is to say, the proportion borne by the Roman Catholics (boys, girls, and infants) to the total number had fallen from 17·2 per cent. in the year 1865–66 to five per cent. in the last quarter of 1868; and of the girls alone about three per cent. only are Roman Catholics now, whereas the proportion was 15·6 per cent. before. The attendance by the boys has fallen almost in a like degree, and it would appear to be not improbable that in a short time there will be no Roman Catholics in the school at all. The failure of Roman Catholic girls is, of course, due to the counter-attraction of the convent school. The boys, on the other hand, are not provided for as yet quite in the same way; but the countenance given by the National Board to the convent school has not been without its effect upon the boys. There has long been a National school just out of the town within the precincts of a Roman Catholic chapel, and this school has been the main educator of the boys. It is held in an old and unsuitable building, on a most unfavourable site, actually in the graveyard, and approached from the town by a level crossing over the railroad, on which—I was told by the master—a boy had once been killed on his way to or from school. It is now intended to remodel this school on a good site, and to follow the example set at the convent school in dividing the boys into two departments—the one for the poor, the other for the better class of boys who are likely to be injuriously affected by their prohibition from attendance at the model school. Of course what has been sanctioned at the convent will not be refused at the boys' school, and the result will be, that in this town of 10,000 inhabitants the State will, in the first place, have erected at great expense a model school for the avowed purpose of extending the principles of united education in its most complete development, which model school it will be supporting at a heavy annual expense, in order to secure the highest attainable efficiency in organization, teachers, and apparatus; in the second place, it will have taken under its care a convent school, whose purpose, equally avowed, is to withdraw all the Roman Catholic girls from this model school, and to render it, so far as girls are concerned, a purely Protestant institution, and to this convent school it will be making annual grants of public money to enable the nuns to afford to these girls an education which is actually inferior to that given at good National schools of the ordinary type, and which ought, *a fortiori*, to be far inferior to that provided at the model school; and in the third place, to complete the process of Protestantizing the model school, it will, beyond a doubt, continue its aid to a school which, in its proposed form, will do for boys all that the convent school already does for the girls. It appears to me that this course of action entails all the possible evils without securing the possible benefits of a denominational system. It is neither economical nor efficient; it promotes not healthy competition but sectarian rivalry; it is neither conciliatory nor impartial. If it is intended that the members of the opposite creeds should be kept separate, let the purpose be avowed, and the fiction of a mixed model school be abolished. If it is desired to maintain at the public cost two or three model schools in one small town, let them at least be placed on an even footing and share equally in the State subsidy. If economy is to be disregarded, let the money at any rate be spent so as to secure equal efficiency in the rival schools. If the attempt to smoothe down the asperity of religious animosities by blending the school-life of Protestant and Catholic is to be given up, let no possible charge of favouritism embitter still more the passions which are already sufficiently keen.

Action of the Commissioners of National Education.

516. As it stands, the action taken in this matter by the administrators of a mixed and non-sectarian system of education forms a tale of self-contradiction throughout.

SECTION X.—SCHOOLS OF THE CHRISTIAN BROTHERS.

517. The Christian Brothers are a body of men bound together by monastic vows, and existing for the special purpose of educating boys, particularly poor boys, according to the principles of the Roman Catholic religion, gratis. The institute was established in the year 1802, when the first school of the Brothers was opened in Waterford. Since that date their schools have largely increased in number, especially during the last twenty years, or thereabouts. In 1851, the school at Armagh was established, and towards the close of 1866 the first Christian Brothers' school in Belfast was opened, in Barrack-street. This was shortly followed by a second in Donegall-street. These three are the only schools of this character within the limits of my district.

Institute of the Christian Brothers.

518. The fundamental principles of the institute are comprised in the above statement of the purpose for which it was called into being. These principles are that the Brothers should devote themselves to the instruction of poor boys especially, that they should instruct them gratis, and that they should above all things instruct them in piety and religion. Poverty on the part of the children, renunciation of emoluments by the Brothers, and an expressly religious aim in the teaching, are the leading features of the scheme.

Principles of the Institute.

519. In its inception the institute was intended to cope with the mass of ignorance among the Roman Catholic poor, brought about through the operation of the Penal Laws, under which instruction by Roman Catholic teachers had been prohibited. The opportunity afforded by the abrogation of the Penal Laws opened up a wide field of labour, upon which the Christian Brothers were not slow to enter. Poverty and ignorance met them on

Its original aim.

CHRISTIAN BROTHERS' SCHOOLS.

every hand, and there was not a Roman Catholic district in Ireland where such services as theirs were not urgently needed.

Its present position.

520. But the development of the National system of education has entirely changed the face of the country in this respect. It can no longer be truly said that the poor of Ireland are in need of the means of education. Better schools and a better attendance at the schools are needed indeed; but so far as my opportunities have enabled me to judge, no child however poor is without the means of obtaining near at hand at least a tolerable instruction in the rudiments of secular knowledge. Thus the *raison d'être* of the Christian Brothers' Institute no longer exists, and with the altered circumstances of the times the attitude of the Christian Brothers' schools has been modified likewise. The position which these schools now occupy may be gathered from the fact to which I have already adverted of their great increase in number in recent years, during the period when the absolute deficiency of primary schools has been least, and when indeed schools are rather too many than too few. In short the Christian Brothers' schools are now rivals to the schools of the National Board, and not supplementary to them.

The Belfast schools are rivals to the model school.

521. As a consequence the Brothers no longer adhere strictly to the condition of poverty, which their rules prescribe in the choice of their pupils, but on the contrary in Belfast their aim is rather to attract the sons of the better class of the Roman Catholic population. It is well known that the model schools of the National Board are the object of vigorous and persistent attack on the part of the Roman Catholic hierarchy. In some places the Catholic children have been almost entirely withdrawn from the model schools in obedience to directions from the altar; in Belfast the number is being rapidly reduced to an insignificant proportion. It is the special aim of the Christian Brothers in Belfast to receive those boys who would otherwise probably attend the model school; these are usually of a higher social grade than the pupils of an ordinary National school. In no schools that I visited was there less appearance of poverty among the boys than in the two Christian Brothers' schools at Belfast. How far the Brothers have been successful in withdrawing boys by the aid of the priests from the model school, may be inferred from the specimen drafts which I examined in the highest room of the Barrack-street school; out of thirty-five boys whom I examined in that room, 17, or all but one-half, had been pupils at the model school.

The Brothers no longer seek the poorest boys.

522. I have already mentioned that in this very same street, and within a few steps only from the door of these schools, stand the Barrack-street Ragged schools, containing amid a large preponderance of Protestants, a considerable minority of Catholics of the poorest class. If poverty were still made a paramount condition, these and not the model school boys should have the first claim on the Brothers. But it is not so. The ragged Arabs of Belfast are free to attend this exclusively Protestant school, where there is no guarantee for religious liberty beyond the good sense of the ladies who manage it, and of the teachers whom they employ. The Catholic *bourgeoisie*, on the contrary, who can avail themselves of a model school managed on the strictest principles of religious equality, officered by teachers of all denominations, and superintended by a district Inspector who is himself a Catholic, are subjected to such a pressure from their spiritual advisers that they have almost all vacated their places in the model school, and are filling, to the exclusion of the poor, the walls of the schools of the Christian Brothers.

Nor do they in effect teach them gratis.

523. But it may be asked, if the Brothers no longer insist upon the condition of poverty, do they still adhere to their principle of affording instruction *gratis?* Would it not be a monstrous perversion of charity to relieve the respectable shopkeepers of Belfast from their liability to pay for their children's education? The plan followed was explained to me to be this—when the Brothers are to be introduced to a fresh school, funds are in the first place raised by the local clergy, for providing suitable buildings, both for the housing of the Brothers and for the school. The bishop of the diocese further guarantees a certain annual income for their support, and the amount is raised by the priests from their several congregations by means of collections in their churches. An account is kept of the sums contributed by the various subscribers, and this list is, to some extent, a sort of school list, that is to say, a parent who has or who expects to have a son in the schools, subscribes in church according to his means, towards the maintenance of the Christian Brothers' establishment. In school, the only charge the Brothers make is one of one penny a head weekly, and the amount produced by this capitation fee is expended strictly on the school itself, in providing materials, pictures, emblems, and for various incidental expenses, repairs, &c. Thus the principle of gratuitous teaching is maintained so far as regards fees contributed in school, the teaching being gratuitous, however, not in the sense that the boys pay nothing, but in the sense that their pence are expended by the Brothers for their benefit. But it will be seen that this penny a week does not represent the real expense to the parent, or at least it only does so in some instances, for I do not mean to say that there are no poor boys admitted, especially in the Donegall-street schools. The rest of the expense falls on the parents as members of certain congregations, though no doubt others who are not parents contribute also.

The competition of the Brothers depresses the Roman Catholic National schools.

524. The Christian Brothers in Belfast, then, are a sort of lower-middle-class school corporation, founded on strictly Catholic and religious principles, in competition with the National Board of Education, and under the direct and active patronage of the Catholic hierarchy. Their competition affects not the model school only, but all the National schools under Catholic management as well. The masters of Catholic National schools with one voice complain that the Christian Brothers draw off from the whole town the boys who formed their best and most remunerative pupils, and they exclaim against the hardship to which they are subjected, when through no fault of their own their schools are reduced, and their fees rendered less productive, by a competition which they are not equal to encounter.

The Brothers at Armagh.

525. In Armagh, where there is no model school, the case is different. The boys in the Christian Brothers' school there are mainly of the ordinary National school type; but still the effect of the competition between it and the Roman Catholic National school for boys is, that the latter is in a miserably impoverished and ill-regulated condition. There is the same preference shown by the clergy towards the Brothers over the National teacher, and the same inability on the part of the latter to hold his own against their partiality.

Boys pass to and fro between the Brothers' and the National school.

526. What might be the preference of the parents if they exercised an independent choice between a Christian Brothers' school and an ordinary National school under the management of a priest, I had not sufficient means of judging positively. At Armagh boys are represented as passing frequently backwards and forwards from the one school to the other, as though it were matter of indifference to them which school they attended. The master of the National school told me that boys were constantly coming to him with a reading book of the Christian Brothers' series, and were puzzled to find that they might not use it there. He had one of these books in his desk which he had taken from a boy on the day of my visit. I am inclined to think that here the parents, through ignorance and indifference, have really very little preference in the matter. That the Belfast Christian Brothers' schools are extremely popular I do not doubt, and numerous applicants for admission are being continually refused for want of room; but I do not believe that the parents, as a body, find anything to object to in the Roman Catholic National schools, and any apparent preference they may show for the schools of the brothers is due partly to the expressed predilections of their priests, and partly, in the case of poor parents, to the professedly gratuitous character of the instruction. If there is any further motive which influences them

Popularity of the Brothers' schools in Belfast.

in favour of the brothers it is one which arises from the attraction presented by lives of devotion and self-sacrifice, and from the spirit of enthusiasm which the brothers throw into their work. CHRISTIAN BROTHERS' SCHOOLS.

527. The immediate superintendence both of the house in which the brothers live together, and of their schools, is committed to a "Brother Director." In the two communities which I visited the Brother Directors were men of middle age, or past middle age; the other brothers were all young men, some of them very young. In Belfast the community consists of ten brothers, besides an occasional supernumerary in his novitiate. Six are attached to the Donegall-street schools, three to those in Barrack-street, and the Brother Director visits both schools alike. In Armagh there are two Brothers besides the Director. The teaching staff.

528. I was readily admitted to all three schools, and permitted to examine the boys at my will. Accordingly, I spent three days in examining the Donegall-street schools, which are the largest, and in which I examined specimen drafts of boys throughout the various divisions; I also spent one day in examining the highest room at Barrack-street, and one day at the Armagh school. Ready permission to examine granted.

529. I append a summary record of the examinations, showing the per-centage of marks gained by the various classes in some of the leading subjects. The Reading Books referred to are, of course, those of the Christian Brothers' series. In Belfast the highest development is attained in the Barrack-street schools, which are more particularly the rivals of the model school, and in which the boys are, on the whole, of a higher social grade than at Donegall-street. The Armagh school is throughout inferior to both the Belfast schools, both socially and educationally. Record of examinations.

DONEGALL-STREET SCHOOLS. Donegall-street schools.

Taught by Six Brothers. On Roll, 566. Present, 513.

Room.	Class.	Number examined.	Average Age.	Per-centage Marks in— Reading.	Per-centage Marks in— Arithmetic.	Writing.	Dictation.
1st Room.							
On roll, 203. Present, 177. Two Brothers.	(a.) Highest draft in 1st Book,	12	8	54	(None),	(None.)	.
	(b.) " " Sequel,	12	8	51	(None),	(None.)	.
	(c.) " " 2nd Book (monitors),	14	9½	55	(Simple rules),	Copybooks fair	.
2nd Room.							
On roll, 135. Present, 120. Two Brothers.	(a.) Class in Sequel,	18	9½	50	(None),	Largehand copybooks fair.	.
	(b.) Lower draft in 2nd Book,	10	9⅛	60	(Simple addition and subtraction),		.
	(c.) Upper " " (monitors),	12	9⅞	65	84 (simple rules),		.
3rd Room.							
On roll, 126. Present, 118, One Brother.	(a.) Highest draft in 2nd Book,	16	10¼	66	56 (simple rules),	Copybooks clean and good.	—
	(b.) " " 3rd Book (monitors),	11	11	75	70 (compound rules),		Good.
4th Room.							
On roll, 102. Present, 98. One Brother.	(a.) Lowest desk in 3rd Book,	12	11½	61	53 (simple rules),	Copybooks clean and good.	Bad.
	(b.) Middle " "	12	11⅝	.	67 (compound rules),		—
	(c.) Highest " 4th Book (monitors),	11	13½	80	81 (comp. rules and simple propn.),		Good.

In English grammar the results were generally unsatisfactory—even in the highest monitors' class they were only tolerably good.

BARRACK-STREET SCHOOLS. Barrack-street schools.

Taught by Three Brothers. On Roll, 388. Present, 339.

1st Room.—On roll, 139; present, 121.—Some in 2nd Book (monitors); majority in Sequel and 1st Book, as in 1st room at Donegall-street.

2nd Room.—On roll, 124; present, 107.—In 2nd Book, except 33 in 3rd Book, from whom monitors are supplied. This covers 2nd and 3rd rooms at Donegall-street.

Room.	Class.	Number examined.	Average Age.	Per-centage Marks in— Reading.	Per-centage Marks in— Arithmetic.	Dictation.
3rd Room.						
On roll, 125. Present, 111. One Brother.	(a.) Lower draft in 3rd Book,	10	9⅓	45	68 (simple and compound rules),	Bad.
	(b.) Middle " "	12	10¾	73	53 (compound rules and proportion),	Fairly good.
	(c.) Head boys (4th Book monitors),	13	13	94	69 (proportion, practice, vulgar fractions)	Good.

English grammar in the two lower drafts was backward. Writing good throughout.
The Fourth Book monitors a very intelligent class: their test in arithmetic exceptionally hard.

ARMAGH SCHOOL. Armagh school.

Taught by Two Brothers. On Roll, 309. Present, 186.

Room.	Class.	Number examined.	Average Age.	Per-centage Marks in— Reading.	Per-centage Marks in— Arithmetic.
Lower Room.					
On roll, 206. Present, 106.	Highest class in 3rd Book,	19	11⅞	59	50 (simple rules).
Upper Room.					
On roll, 103. Present, 80.	(a.) Class in 2nd Book,	7	9	19	(None.)
	(b.) " 3rd "	12	11⅝	55	44 (simple rules and compound subtraction).
	(c.) " 4th "	10	12¾	80	65 (simple and compound rules and simp. proportion).

Dictation was poor in the head class, bad in the next. English grammar bad, except in the case of a few boys out of the head class. Copybooks only good in the head class.

530. There are two features in these records which stand out in contrast with the schools of the National Board —the smallness of the number of teachers for so large a number of boys, and, in Belfast at least, the regularity Two noticeable features.

CHRISTIAN BROTHERS' SCHOOLS.

with which the boys attend. The one is a source of weakness, the other of strength, which do much to complicate the comparison of the Christian Brothers' schools with those of the National Board. The advantage gained by an attendance of about ninety per cent. of the whole number of boys on the roll is one which every National school may well envy, though without much hope of rivalling it. So strong is the position of the Brothers in Belfast that they can afford to expel irregular boys, and their practice is, their schools being perfectly full, to regard a boy's place as *ipso facto* vacant if he is long absent without cause. Not only, therefore, do the brothers attract boys of a social class which is best able to supply satisfactory pupils, but of these too they reject all the incorrigibles; what they retain is the *crême de la crême*.

The regularity of attendance at Belfast,

and the small number of teachers.

531. On the other hand, a very large number of boys is confided to the tuition of a single brother—a far larger number, in fact, than any one man can personally attend to. It becomes essential to make the most of his labours. Some subjects can be taught to the boys *en masse*, others cannot. For all lessons given *en masse* the single brother is sufficient; for all the rest he must depend largely upon young boys acting as monitors.

Reading and writing.

Reading and writing alone require no subdivision of the scholars, and accordingly, I find that in the Belfast schools reading and writing are both taught with marked success. In reading, the method pursued is this. The boys are massed together to the number, perhaps, of one hundred; the brother stands before them and explains the whole lesson to them, points out where an emphasis should be laid, warns them against the mispronunciations of their brogue, and reads the passage out to them in a manner for them to imitate. Having thus familiarized them with the whole lesson, he begins again, reads a sentence or a clause to them, and they repeat it in chorus after him. If anything does not please him in their tone or pronunciation he calls attention to it, and the clause is repeated till it is done to his satisfaction. The effect of this elaborate mode of instruction is shown in the clearer and more outspoken reading of the boys. In the writing, cleanliness and neatness were everywhere remarkable. This is, perhaps, only one phase of the universal order and regularity which pervades the Christian Brothers' schools. But in arithmetic, in which the powers of different boys vary greatly, there are wide divergencies in the several rooms, and in English grammar, which needs a good deal of individual explanation and questioning, the effect on the whole was unsatisfactory. It is unavoidable that a great deal of a boy's arithmetical knowledge will be gained by simply working out examples under the eye of another boy only just a class above him in general attainments. In every case the monitors of the several rooms were decidedly in advance of the rest, and they of course receive their teaching from the brother himself.

Arithmetic and English grammar.

Inequalities in the school work.

532. Comparing these schools with the National schools, then, I find what might be expected, that while the monitors in each room, and the head boys generally, are in a condition that would do high credit to any National school, there are inequalities among the different classes such as would be smoothed down in a school adequately officered. For instance, the highest class in the second room at Donegall-street school, average age under 10 years, is far superior to the lowest class in the fourth room, aged 11¼ years. The first is in a forward state, the latter backward. Moreover, the Belfast schools, being of recent organization, have as yet scarcely reached their normal condition, and on this account allowances and reservations have to be made, which forbid an unqualified judgment on the merits of what I saw. It is impossible to say how much of what is creditable may have been mainly due to the model school and other schools from which the boys have been drawn, nor how much of the unevenness now noticeable may disappear in process of time.

The Armagh school.

533. These remarks do not apply to the Armagh school, which has been in operation since 1851, but which is by no means on a par with a good National school.

Order and discipline.

534. To counteract as far as possible the disadvantages of a small teaching staff, the Brothers adopt a strictness of discipline and order which gives them a remarkable power of supervision over the whole of their pupils. To a stranger who might not be accustomed to the regularity of a good school, the precision with which everything is carried on at the Belfast schools of the Christian Brothers would be almost startling. Imagine a large, airy room, with some dozen of parallel desks, a raised dais at the end for the Brother, above which, against the wall, stands an image of the Virgin, with a few flowers and other emblems. The walls of the room are hung partly with maps, partly with French prints of scenes from the New Testament. A lesson is proceeding (say) in geography, and the boys are standing in ten or more small semicircles against three sides of the room, each set engaged upon a map, and under the guidance of a monitor. The Brother, in long, black stole and cruciform cap, passes from group to group, aiding and explaining, and seeing that all are at their work. The desks being completely emptied, he is able from any point in the room to command a view of all the groups. The lesson is going busily forward, when the clock strikes one of the hours. Instantly, without even a hint or a sign from the Brother or monitor, every boy has turned towards the image of the Virgin; in reverent attitude, with hands closed and eyes shut, he says a short prayer, makes the sign of the cross, and turns to his geography again. In a few seconds all is going on as before. Soon the time allotted to this lesson is over, the Brother mounts the dais, and by a slight "click" made with a small wooden instrument, which would be inaudible in a noisy room, signifies that a change is to be made. The groups at once fall back into a line against the wall; there is perfect silence, and every boy watches the little wooden instrument in the hands of the brother for the next sign. At a gesture with this the boys from each side of the room glide almost noiselessly into their desks, for each group has been stationed as nearly as possible opposite to the desk to which it belongs. At another sign they take their seats, and again wait. At the next every copybook is out and opened. At the next the lid of every inkstand is thrown back with a sound like the discharge of a percussion cap, so simultaneous is it. Then each boy proceeds to write his copy, and the Brother again betakes himself to his labour of supervision and direction. During the whole time occupied in writing the copy not a word is uttered by any boy. I have seen many National schools which are models of good order, but in none have I witnessed such a soldierlike precision of discipline as is attained in the schools of the Christian Brothers in Belfast.

Necessitated by small number of teachers.

535. It is indeed manifest that without such regularity and order it would be quite impossible for these schools to produce results at all comparable with those attained in a good National school. The Brother is a more cultivated man than the average National schoolmaster. He has been trained to his work, and is familiar with the approved methods of teaching. But unless he had the power of constantly and almost simultaneously supervising the work of all his monitors, his labours would be in vain with so large a number of boys. By the system the Brothers adopt he is able to make himself almost ubiquitous in his room, and even if he cannot always correct a monitor for false teaching, he at least can secure one thing, and that he does secure, namely, that the teaching, be it false or true, shall go on, and no time be spent in idleness.

Moral tendency of the system.

536. In their moral aspect, the Christian Brothers' schools appear to me to have a tendency which is the very reverse of that which may be traced in the National system. The perfection of demeanour which characterizes the boys, the complete ascendancy which the Brothers exercise over their minds, without, so far as I could observe, any sign of harshness, the suppression of the wonted symptoms of boyish playfulness under a religious seriousness rarely developed at so early an age, are parts of a system which may be admirably adapted to make

true and earnest adherents of the Church, but is opposed to the formation of that robustness and independence of character which a method of greater freedom tends to promote. In this respect the Christian Brothers and the Nuns are entirely at one. Both rely upon the sentiment of personal attachment on the part of their pupils, and produce a docility and submissiveness elsewhere unknown. But the opportunities which the National school in its wider scope affords to a boy of forming for himself a tolerant judgment of what he sees in the world are shut out here, and he learns to take no step except in leading-strings. CHRISTIAN BROTHERS SCHOOLS.

537. The perfection to which the discipline of the Belfast schools has been brought was strongly impressed upon me by a scene which I witnessed in the Fourth Room at Donegall-street. Hearing a chorus of voices in it, I looked in to see what it might mean. It was a time devoted to religious exercises, and the Brother had left the boys, about 100 in number, to perform their devotions in his absence. I came in unobserved, for the faces of all the boys were turned from me towards the image of the Virgin. All were kneeling on the forms, with clasped hands, and with the appearance of earnest devotion. One boy, as leader, was saying a prayer clause by clause, and the rest were repeating it after him. I watched them for some time, and looked minutely to notice the demeanour of individual boys; everyone seemed to be taking his part, there was absolute uniformity, and no one that I could see was wanting in attention or apparent earnestness. I was told that the Brother could leave them thus with entire confidence, that they would perform the service with exactly the same regularity as if he were present. I am sure it is true that he could. Religious exercise at Donegall-street schools.

SECTION XI.—CONCLUSIONS.

538. I have now passed in review to the best of my ability, but how inadequately I am painfully conscious, the phenomena which met me in different directions during the progress of my inquiries. I propose in conclusion to gather together the practical inferences which appear to me to flow from them, and so far as I may venture to do so without presumption, to indicate the measures which have occurred to my mind as desirable or necessary for the attainment of the ends for which the Commission was issued. Practical conclusions to be drawn.

539. Two primary objects are to be kept in view in dealing with the difficult subject in hand, the one political, the other educational. It is desirable to allay existing animosities, and to avoid giving new causes of offence and estrangement between members of conflicting religious creeds; and secondly, the aim must be to secure the best possible education for the people, at the smallest cost to the State. The two problems are distinct, and each of the highest importance. The solution of the one depends upon the method pursued in dealing with what is called the religious difficulty; the other is a matter of administration in detail. Nevertheless, easily distinguishable as the two matters are in their character and purpose, they have a powerful reciprocal influence, and it is impossible to exhaust the consideration of the one without continual reference to the other. The solution of each is checked and limited at every stage by parallel considerations on the other side. Two primary objects—one political, the other educational.

540. The controversy about the religious difficulty is narrowed to this issue—shall the National schools be non-sectarian or denominational? The Protestant managers of National schools almost unanimously support the non-sectarian or mixed system; the Roman Catholic hierarchy with similar unanimity ask for the right to educate their children in separate schools, free from restrictions concerning religious emblems and observances. The kind of denominationalism they ask for is such as would make the attendance of Protestant children at their schools at all times impossible. As the Right Rev. Dr. Dorrian, the Roman Catholic Bishop of Down and Connor expressed it to me, they require that even secular instruction should be imbued throughout with an "aroma" of Catholicism. The religious element would be as prominent, the dogmatic teaching as direct, and the religious observances as frequent as they now are in the schools of the Christian Brothers. It is idle to talk of a conscience clause in such a case. No conscience clause could possibly be framed which would satisfy the minds of a Protestant minority. The experience of the National Board has proved that a relaxation of the rules now enforced in support of the mixed system would be a measure running counter to the demands of the times, for the most stringent rule of all, which requires the complete removal from the room of children of the opposite creed to that of the teacher during religious instruction, has only been reached within the last two or three years. To descend from this to a mere conscience clause would be to sacrifice the mixed system entirely. The choice then is between the existing system or some modification of it, and a system of complete denominational separation. The political question turns upon the religious difficulty—a non-sectarian or a denominational system.

541. In support of their views of the question, the priests argue thus: they say "You in England have a denominational system supported by public grants; if that system is good for you, why is it not good for us? Why is Ireland treated differently in this matter from England? We, the Catholic hierarchy of Ireland, representing the vast majority of the people, ask to have the English principle in education extended to us, and why is it not granted?" And the implied answer is that the existing system is due to that Protestant ascendancy which has so long crushed the liberties of Ireland. At first sight this is a plausible representation of a hardship, which it would be consistent with the newly inaugurated policy of the country in Irish Government to alleviate. But a moment's consideration exposes the utter absence of parallelism between the two cases. Education in England is carried on by a process which, in its chaotic diversity and unevenness, displays the natural product of the nation's growth; schools exist or do not exist, are efficient or bad, according to the zeal or supineness of independent individuals and communities; the schools are emphatically the property of the people as distinguished from the Government, and only in recent years has it seemed good to Parliament to extend to such of them as comply with its conditions the benefits of inspection and pecuniary grants, the latter amounting to about one third part of the annual expense of a school's maintenance. In Ireland, on the contrary the educational system is the direct creation of the State, maintained almost entirely by grants from the public purse. If State aid were withdrawn in England, the other resources of the schools would still suffice to support them, though in diminished efficiency; if the same thing were done in Ireland, the schools could not exist on their own resources for a week. Therefore the question propounded suggests an entirely false parallel, in that it assumes an identity and ignores a complete diversity of circumstances. To avoid a fallacy, the question should rather be whether it would not be desirable for Ireland to have a system of education spontaneously evolved from itself as we have in England; and in this form the demand is one which a deplorable but irreversible past has rendered it impossible to grant. The fact must now be accepted that the Irish as a people apart from the Government have not what the English people have, and what, inasmuch as it can only be the growth of generations, it is impossible for a Legislature to give. In default of a popular system, they have received a State system, which is an utterly different thing; and to suppose that the principles of Government applied to the one are equally suitable or even capable of adaptation to the other, is an assumption wholly gratuitous. The only schools in Ireland which are of a character at all analogous to the aided schools in England, are the non-National schools. Such of the convent schools, Christian Brothers' schools, and Church schools, as have not been established merely out of rivalry to the National system, may be allowed to be the genuine product of the national Argument of the Roman Catholic hierarchy deduced from practice in England. Its fallaciousness when applied to State schools. Extent to which the analogy holds good.

Conclusions.

life in Ireland. The analogy, therefore, of England is good to this extent only, namely as a ground for extending aid to the extent of about one-third of the cost to denominational schools, mainly supported from other sources; furthermore the analogy requires that such aid should take the form of a payment by results. This I think, suggest a very fair subject for inquiry, and the onus may reasonably be thrown upon the supporters of the present state of things in Ireland, to show why to the extent of the analogy the principles adopted in England should not be admitted there. But the claim put forth by the Irish Roman Catholic hierarchy is to the effect that the State should directly, and at its own sole or nearly sole cost, support exclusively denominational schools; and for this claim the practice in England affords not the slightest support.

Two distinct questions, touching National and non-National schools, respectively.

542. The matter, then, resolves itself into two distinct inquiries, the one touching National schools, whether, in spite of the absence of analogy in the practice in England, it is yet desirable on grounds of public utility that the State should support almost at its sole cost an exclusive system of education in Ireland; the other touching non-National schools, whether State aid should be accorded to denominational schools in Ireland, on conditions analogous to those allowed in England.

National schools.

543. With respect to National schools—whether vested or non-vested, for in either case the State bears the brunt of the expense—the question appears to me to turn entirely upon the view taken of the functions which the National system is intended to discharge. This is a consideration which in England, where the State does not take the initiative, does not arise; a private individual who establishes a school to be supported mainly at the expense of the locality may be free to entertain sectarian or proselytizing objects in what he does; the originating motive is with him, and not with the State. But in Ireland, the scheme of National education originated with the State, and it is incumbent on the State to have a regard for its own motives in taking that step. The proper ends of a system of State education are simply the education of the people; no collateral objects have been avowed in the case of the Irish system, but on the contrary Parliament recognised the extent of its duties by taking precautions for the equitable distribution of the State funds among people of all religious creeds promiscuously, and by defining for the National Commissioners a position of complete neutrality in matters of religion. From the first, then, the sole and proper object of the Irish system has been an educational one, and to a misconception or perversion of the object aimed at is to be ascribed the present attitude of the Roman Catholic hierarchy. In all my conversations with the priests there was always this fundamental difference between our respective points of view: I regarded the object of the system to be to afford the best possible education to the largest number of the people at the least cost to the State; all other objects I regarded as secondary and parasitic; they on the other hand plainly regard the educational objects as of secondary moment, and interpret the primary end to be the promotion of fidelity in matters of religion. Hence their violent animosity towards the model schools; the priest is not paramount there as he is in his non-vested school; the child there learns to recognise other authority besides that of the priest, and in this way, it is alleged, the sense of submission to spiritual advisers is weakened. As one of the Belfast priests expressed it to me, children learn at the model school to think for themselves, "and" said he "we don't want our people to think for themselves." No comment is needed on the depth of the meaning which these words convey. They contain the pith of the whole controversy.

The interests of popular education require that the schools should not be denominationalized.

544. Are the schools, then, for the clergy or for the people? If for the clergy, then the more exclusive the authority of the clergy within them, the more completely will the objects of the system be reached. But if they are for the people, then it behoves us to inquire whether the people's interests are compatible with the demands which the hierarchy are putting forward. I shall endeavour to show that the efficiency of the National system for its own proper purposes of education requires not only that the schools should not be denominationalized, but that steps should be taken to render them more thoroughly National than they ever have been, and that in the interests of the people the demands of the Roman Catholic hierarchy should be once for all firmly denied.

Summary of defects to be remedied.

545. In the foregoing pages I have pointed out from time to time the weak points as they appeared to me in the condition of the National schools. They may be summed up thus:—

(*a*) Many of the school buildings are totally unfit for their purpose.
(*b*) The school buildings are often badly distributed.
(*c*) There are far too many small schools subdividing the work which a few large schools could do more effectively.
(*d*) The position of the teachers and their emoluments are depressed, and consequently many schools are under inferior teachers.
(*e*) There is great irregularity of attendance on the part of the children.

Tendency of remedial measures.

546. To meet these defects the aim should be to replace numerous weak schools by a few powerful ones under high-class teachers. The effect would be (*a*) that unsuitable buildings could be disposed of entirely; (*b*) that a choice of sites would be gained for central schools on the most convenient and accessible spots; (*c*) that a great waste of power would be stopped, and more even competition among the children be promoted; (*d*) that there would be fewer principal teachers, the position of a principal teacher would be one of greater emolument and dignity, and low-class principal teachers might be dispensed with altogether, and (*e*) the capricious irregularity of the children would be corrected, as there would be less bewilderment of choice among conflicting schools. That this is the true policy to follow in the interests of education I am perfectly convinced. Let us see how it might be carried out.

Required to replace principle of semi-denominationalism and subdivision by that of combination.

547. The present multiplicity of small schools has been brought about by a system of covert denominationalism. Every minister of religion wants to have a school of his own, with religious instruction for his own creed only, and the Board of National Education have been in the habit of acceding to applications on every hand. The remedy lies in the reversal of this policy, and the replacing of the principle of separation and subdivision by the principle of union and co-operation. This requires that there should be perfect equality in all respects among all denominations in each school, and that religious instruction should be afforded either to all or to none. The typical form to which the schools would be assimilated wherever the clergy of all denominations could agree in the management would be that which enables children of each creed to receive separate religious instruction in the school, as is already done in some non-vested schools. It would be necessary to insist in these schools upon the principle of combination being carried out at every point, that is to say, all denominations should be equally represented in the management, so that an exclusion such as that which I have described at Holywood would be impossible; the teachers should be of all denominations, as is already the case at Whitehouse and Holywood, and equal facilities should be allowed to the clergy of each creed to attend for the purpose of giving religious instruction, as they now give it at the Whitehouse school. In country districts I should hope that many schools might be modelled on this form, and all the vested schools would naturally fall into the same category. The alternative form would be one in which no religious instruction at all would be permitted. Though this would be a less satisfactory type, it would avoid all the difficulties which arise about the regulations for the protection of minorities against religious teaching from which they dissent, and would remove all sense of inequality from the minds of parents and children. The mode of procedure, therefore,

Religious instruction in each school for all or for none.

would be first to invite all the clergy and managers of National schools of all denominations in any district to co-operate in the management of a central school of the first type. One or two superfluous buildings would probably be utilized for separate girls' and infants' departments. If the managers and clergy would not combine, then their schools, remaining still under exclusive management, would become schools of the second type, and be devoted solely to secular instruction, as are the schools at Blackwatertown, Blundell's Grange, and others to which I have referred. Conclusions

548. It would be difficult, no doubt, to deal with the numerous small schools which now do so much injury to the education of the country if managers refused to combine. In the last resort, it might perhaps be necessary for the Board to have power to buy up a non-vested building if the patron remained obdurate. If he refused to be compensated so, his school would then be cast adrift entirely. In all cases the rule should be clearly laid down and rigidly enforced, that the State supports no more schools than are necessary to secure the highest attainable efficiency in education. Difficulty of dealing with managers who refuse to combine.

549. I may be told that this plan would not be practicable or popular in the present state of feeling in Ireland. My reply is, that I have faith in the ultimate efficacy of principles of absolute fairness and equality, and that so far as I have had experience of schools of the types which I have been describing, I find therein grounds of encouragement and hope. Importance of complete equality.

550. I have strong grounds for believing, too, that many of the most influential clergy of the Established Church, who now hold aloof, would on these terms give in their adhesion to the National system. With the more uncompromising of them, who, in a country mainly Roman Catholic, pledge themselves to resolutions like the following, which was passed at the annual meeting of the Down and Connor and Dromore Church Education Society in 1868, negotiation must, I fear, be fruitless. The italics are mine. Possible adhesion of the Established Church clergy.

"Resolved,—That, recognizing the Holy Scriptures as the only rule of faith, and essential to the maintenance of true Christian morality, the Members of this Society retain their unalterable conviction that any system of education *in which the Word of God is not made a part of the daily instruction of every child in attendance, and in which reference thereto is not permitted at all times*, is not only defective in its fundamental principles, but dishonouring to the revealed will of God to man."

But I can positively affirm, from many conversations which I held with them, that a large proportion of the clergy would be not unwilling to accept as a compromise a plan of complete secularization. To a restricted use of the Bible they feel a strong repugnance; to acknowledge the National teacher as a purely secular personage is not an impossible concession for them to make.

551. Incidentally the amalgamation of small schools would go far to improve the prospects of the teachers, by increasing the number of prizes in the profession. But more than this is required if the teachers are to be raised in character, tone, and ability. They must be no longer the slaves of their managers, but a position of comparative independence must be secured to them. In the National teachers the State possesses an instrument for good or evil whose power can scarcely be overrated. It is a suicidal policy which keeps them in a state of chronic discontent, when they might form a very bulwark in the interests of loyalty and order. If small schools were amalgamated the emoluments of the teachers might be largely increased without additional expenditure; if the social position were made more inviting by increased security, a higher class of men would be tempted to enlist in the service, and less would be heard about desertions on the part of the most promising recruits at the first offer of employment elsewhere. It is idle to expect a man of enterprise and ambition to bind himself over for life to the caprice of an irresponsible manager, and the National system is sorely in need of more men of such character. Improvement in the emoluments and status of the teacher.

552. With the National schools thus consolidated and strengthened in their position of neutrality amid conflicting religious denominations, the second branch of the subject comes up for consideration. Is anything to be done for non-National schools? In what I have said concerning National schools it will be observed that I have taken no account of Convent schools under the National Board. The reason is, that, as may have appeared from my remarks under the head of Convent schools, I find it impossible to regard them as other than denominational institutions. The Convent schools which I saw are indeed all in receipt of State aid, and subject to the regulations and restrictions of the National system; but as I have endeavoured to show, their position in the system is altogether anomalous and unnatural. They writhe under the fetters which the National Board imposes upon them, because in their case these fetters answer no practical purpose. Within the walls of a Convent regulations for the protection of Protestant consciences are useless, and therefore vexatious. Moreover, as I have already implied, the Convent schools do not belong in their origin to the State system. They have an independent existence of their own, analogous to that of English denominational schools, and the State is to them, not a parent, but only a friend. If it is demanded that English principles in education be applied to Ireland, the Convent schools, but not the ordinary National schools, afford material on which to operate. It would therefore be reasonable and consistent, and conducive to the contentment of the managers of Convent schools, if it were no longer attempted to assimilate them to ordinary National schools—if, in fact, the difference which exists in their origin and nature were allowed also in their treatment. Convent schools would then assume a position outside and auxiliary to the National system, and, as denominational schools, would be treated as nearly as possible according to the precedent of the Privy Council in England. Their grants would take the form of a capitation payment and a payment by results. I have shown that on the whole the Convent schools that I saw are inferior in their results to ordinary National schools; payment by results would stimulate them to reach an equal standard. Whether the Nuns should be required to pass an examination for certificates of competency to teach is a point which I postponed when speaking of the special rules which relate to Convent National schools. The results of my examinations alone would lead me to think that some form of test might be desirable, for in the present condition of affairs there is little or no guarantee of efficiency in the schools, and a bad Convent school is paid at the same rate as a good one, while the difference in point of merit between, for instance, the Crumlin-road Convent school in Belfast and the Armagh Convent school is exceedingly great. But the Nuns would resent a change after the long exemption they have enjoyed, and the system of payment by results would probably answer the end sufficiently well. *Non-National and Convent schools.* Convent schools really denominational, and should be treated as such, and aided by grants on payment by results. This would render examination of Nuns for competency unnecessary.

553. As payment by results has been mentioned, a question may arise concerning the advisability of extending that principle to ordinary National schools; but it must be remembered that the principle is already acted upon in the assignment of class and salary to the teachers, which are determined by regard to personal attainments as tested in examination, and to practical success in school-keeping, combined. The teachers themselves deprecate any further extension of this method of payment. Their incomes, though tolerably stable, are small enough; payment by results would add uncertainty to penury. Should payment by results be extended to National teachers?

554. The recognition of convent schools as denominational schools extra to the National system would set a precedent, the extent of whose application it would be necessary carefully to define. Rights granted to convents would be claimed equally by such bodies as the Christian Brothers and the Church Education Society. Other denominational schools.

Conclusions.

555. In this matter, as throughout the whole subject of this inquiry, the paramount consideration should be, the advancement and improvement of popular education at the least possible cost. The primary duty of the State would be towards the State or National schools, which already thickly cover the face of the country. By the measures which I have suggested they should be vastly strengthened and improved. A denominational school would only be recognised where there was a void in the National system to be filled. Nothing should be done to foster that baneful competition of primary schools which is already only too frequent. In country places the National school would remain with no other competition than that which it now has to meet, for there is scarcely a village in my district where the National system does not already occupy the ground; any claim for aid to denominational schools in them would be at once refused on the ground of superfluity.

When should they be aided?

556. In such a town as Belfast, any application for aid to a denominational school would only be granted after inquiry into the local circumstances. If the National schools were already sufficient for the needs of the locality, aid would be refused, nor should any step be taken which would seriously endanger the position of the National teacher.

The National system would not be endangered,

557. I do not for a moment believe that the recognition of denominational schools to this extent, and on these terms, would at all endanger the National system. It would only be in populous places that these schools would receive any encouragement, and then the aid they would be entitled to would be very small in comparison with the amounts allowed to National schools. About one-third of the expense of maintenance might be earned from the State on a system of payment by results; the managers would have to provide the remaining two-thirds; and even this would only be possible in default of adequate accommodation under the National system. On the other hand the benefits of the plan would be (1) that convent schools would have to earn their money, and would be greatly improved by the process; (2) that an unsound part of the National system would be cut off from it, and the system would be left homogeneous and equally balanced; (3) that any school really useful would be submitted to inspection and rendered efficient; but the profusion of National schools is so great that very few denominational schools could make out a shadow of a case for themselves. The convent schools being already in receipt of State aid would, of course, be credited with the right to continued assistance, without the necessity of proving their case.

while an educational advantage would be secured.

558. The same inspectors would visit both kinds of schools, and an equal standard of proficiency would be adopted.

559. The general result of such action as that which I have just attempted to sketch out would be, as I believe, the removal of all reasonable ground of complaint that English principles are not adopted in dealing with Irish education, a great advance in the education of the people through the improvement of the teachers and the consolidation of the schools, and the increased stability of a system which, with all its defects of administration, and however warped and distorted from its original type, is still the noblest protest against sectarian animosities and religious feuds which this country has yet ventured to record.

I have the honour to be, my lords and gentlemen, your very obedient servant,

D. C. Richmond.

Appendix A.

Sources of Income of Country Church Schools in County Armagh.

I have said that the Church schools receive far more liberal voluntary contributions than do the National schools. In fact the Church schools, if not separately endowed, as the Drelincourt and Mall schools at Armagh, nor aided by Erasmus Smith's charity, depend almost solely upon this source of income. They also have, in most cases, the advantage of a teacher's residence. The payments they receive from the Church Education Society are very small, and their fees are often *nil.*

The following list comprises all the Church Education Society's country schools in the county Armagh, which accounted to me for their income in 1867 :—

	Fees.	Church Education Society.	Local Aid.
	£ s. d.	£ s. d.	£ s. d.

Appendix B.

Form of Inquiry addressed to Head Teachers.

Name and description of school, ——— ——— School.
In connexion with ———————

1. Do the poorer classes avail themselves as much as they might of the means of education in your neighbourhood? If not, to what causes do you attribute their neglect to do so?

2. Are there any large industrial or manufacturing works in the neighbourhood of your school? If so, what is their effect upon school attendance?

3. Have you any "half-timers" in your school? If so, how many? Do you experience any difficulty in complying with the requirements of the Factory Acts?

4. What are the several fees payable in your school? Are they regularly paid? Do you think the parents could afford to pay more? If any of your scholars receive a gratuitous education, please state the number.

5. (*In the case of National schools.*) Do you consider the programme of instruction laid down by the National Board in every way suited to your school? If not, be pleased to point out your objections.

6. Be so good as to fill up the following form for the year 1867:—

	£	s.	d.
Amount of school-fees, ...			
Amount received from National Board (or other society), .			
Amount received from local subscriptions or other sources, .			
Total,			

7. Any other statement you would wish to make—*e.g.*, concerning your experience of the practicability of educating children belonging to different denominations in the same school.

(Signed,) _____

Master (or Mistress)

(Add religious denomination.)

Appendix C.

Form of Inquiry addressed to Clergy, Managers of Schools, &c., &c.

N.B.—The following questions are not intended to apply to training, agricultural, or model schools.

1. Are the means for the education of the poorer classes in your neighbourhood sufficient?

2. Do the poorer classes avail themselves as much as they might of the existing means of education? If not, is their neglect to do so due to (*a*) distance from school building, (*b*) amount of school-fees, (*c*) want of confidence in the teacher, (*d*) religious and conscientious scruples, (*e*) inability to forego children's wages, (*f*) or any other cause that you can assign?

3. Can you suggest any plan for inducing a better and more regular attendance by the children at the schools?

4. Is the system of educating children of different denominations together beneficial or not? and what is the popular feeling on the subject in your own neighbourhood?

5. What is the general effect of the several industrial occupations in your neighbourhood on school attendance, and the period of school life?

Have you any views to express concerning the operation of the Factory Regulations as touching the employment of young children, whether boys or girls?

6. Is the instruction given at the schools in your neighbourhood usually gratuitous or not? To what extent do you conceive that school-fees can be advantageously imposed?

7. Have you any information or views to offer on the subject of night schools?

8. Do you consider the system of inspection as carried out by the National Board sufficient for its purpose?

(Signed,) _____

Appendix D.

Replies to Inquiry, "Is the system of educating children of different denominations together beneficial or not? and what is the popular feeling on the subject in your own neighbourhood?"

The extreme importance of ascertaining as nearly as possible what is the predominant feeling in the country concerning the mixed system of education, induces me to present the following analysis and summary of the replies which I received on this head from clergymen and laymen of various religious denominations. In some cases I give the communications *verbatim*; in others I have condensed them for brevity's sake.

I. From Clergy of the Established Church.

1. The Lord Bishop of Down and Connor and Dromore—

"I am a strong advocate for united education, and the feeling in this neighbourhood is also strongly in its favour, with the exception of the Roman Catholic bishop and his clergy, and I have reason to believe they conscientiously object to it, preferring the denominational system, to which I have a strong objection."

His lordship also sent me the following extract from the charge delivered by him to his clergy in 1867.

"Her Majesty's Government having issued a Commission to inquire into the whole system of primary education in Ireland, with a view to future legislation, I do not desire to anticipate the result by any discussion, but I may be permitted to express a hope that by mutual concessions within the limit of principle, we shall be able to arrive at some settlement which will close up the breach in our divided ranks; all that I shall venture to add in the way of an opinion, is an earnest hope that we shall all unite to resist to the utmost of our power every attempt to introduce into Ireland the denominational system, so fraught with impending evils, so calculated to propagate the seed of future, and I may add permanent, discord between sect and sect. Rather than see this pernicious plan adopted, I would prefer a purely secular system, supported by the State, grounded in its teaching on sound elementary books, and tested by systematic and impartial inspection, permitting, though not requiring a religious basis. I can look forward without alarm to such a system being Ireland's educational future, but I look forward with dismay to the introduction of the denominational one, pregnant as it would be with many heart-burnings, and the harbinger, if not the emissary, of future discord.

"I belive it would tend to draw the dark line of demarcation in social life in deeper furrows still between creed and creed from the very cradle to the grave, arrest for years to come our country's progress in the paths of peace and pursuits of learning, and kindle into life, and heat, and action, the now smouldering embers of religious strife."

2. Rev. Archdeacon Saurin, Rector of Segoe, county Armagh—

"Beneficial. I have heard no antagonistic opinion on the subject. I think if political, religious, and trading agitators were to drop the subject there would be no objection to a mixed education on the part of the people."

3. Rev. E. J. Hartrick, Incumbent of Magdalene Church, Belfast, and Honorary Secretary to the Church Education Society—

"I believe it is, indeed I know it is, when it includes instruction of all children in attendance in the Holy Scriptures; the lessons of the Bible, as a revelation from God, being alone calculated to inculcate true Christian love one towards another, loyalty to the Queen, and Christian morals generally. That a different system has failed to be beneficial, the increased acerbity of the Celtic towards the Saxon race in Ireland, and its increasing disloyalty the last thirty years, too truly, and unhappily prove.

"The practically denominational character of the National Board schools in this neighbourhood shows, that the system referred to in this query is not popular here, very few Romanist children being found in National schools under Protestant patronage, and very few Protestant children in schools under Roman Catholic patronage. I would instance Fisherwick-place, Linenhall-street, and Little Charlotte-street National Presbyterian schools, and Donegall-street* and Hamilton-street National Roman Catholic schools."

4. Rev. James Disney, Rector of Killyman, county Armagh—

"In two of the National schools (one male and one female) under me the children attending are almost exclusively Protestant, and in that under the priest they are almost exclusively Roman Catholic. The Protestant children, many of them, pass by the Roman Catholic school to come to mine, and many of the Roman Catholic children pass by mine to go to the chapel school. This is much to be deplored, but I am afraid cannot be avoided. In one school under my management the number of Roman Catholic children attending is about thirty out of ninety on roll; these leave the school when religious instruction is given, as it is daily,

*Now under the Christian Brothers, (D.C.R.)

at a fixed hour. This, too, is to be deplored, but I think it is a decided advantage that, though they won't accept the religious instruction given, they should receive secular instruction along with the Protestant children. I know, too, from experience that they were quite willing to receive the religious instruction which I gave, till prohibited to do so. When I came to this parish the Protestant feeling against the National system was very strong, but it certainly is not so now; the people seem to think it is a fair system, and suited to the circumstances of the country, and the excellent books which the Board sells at a very cheap rate to the poor children are doing a great deal in diffusing useful information among the people."

5. Rev. J. E. Costello, Incumbent of St. John's, Whitehouse, county Antrim.

"It has, of course, this drawback, that a school cannot well, under ordinary circumstances, be opened or closed with prayer, and also that there must be a separation of the children for religious instruction, both of which are, I think, calculated to injure the tone of a school. On the whole, however, I should say it is beneficial, and as far as I know is acceptable to most of the people in this neighbourhood."

6. Rev. James Paton, Curate of Kilmore, county Armagh—

"I do not think the system of National education has worked well for the peace of this country. It has not given satisfaction to either of the two great parties into which the country is divided. A much better system, I consider, would be a purely secular, such as I advocate for intermediate schools. Why should masters and mistresses—drawn, as they are, from every class of the people, sometimes from a class by no means the best—why should they have the responsible charge of teaching religion to the children? Why should not this matter be handed over *entirely* to the clergy? They might gather their children in the churches, the Sunday schools, their own houses, the children's houses—let them do it, I should say, anywhere but in the Government school. At present, I am aware, this is the system *practically* at work under the National Board; but let it be *theoretically* so also. Let priest and minister have nothing whatever to say to the schools in the way of religious teaching, even of their own children, and then we shall have some chance of seeing a mixed education, and some chance of getting rid of the bitterness and strife which arises out of the Educational question."

7. Rev. John Bristow, Rector of Knockbreda, county Down—

"The object of the Government in the establishment of the National system of education was twofold:

"1st. To provide for the lower classes a sound and efficient education.

"2nd. To remove from the rising generation the bitter party feelings which exist between the members of different religious creeds. This end, it was hoped, would be attained by association in mixed schools, where a united education in secular things might be given without any danger of proselytism.

"In both these objects I believe the National system to have failed—in the first *partially*, in the second, for all practical purposes, *wholly*.

"A large proportion of the children of Ireland are prevented from reaping the benefits of the education afforded by the National Board by the conscientious convictions of their clergy—both Protestant and Roman Catholic.

"While the schools which are receiving aid from the Board are not truly mixed schools, but are virtually denominational, being either Protestant or Roman Catholic, according to the religion of the patron or master.

"I believe it to be impossible to devise a system which would effectually associate in the same school Romanist and Protestant, or by such association would in any degree soften the feelings of party which exist between the members of the two creeds (as a rule).

"This secondary object, therefore, of the Government in the establishment of National Education system ought, I think, to be abandoned as impracticable, and that scheme adopted which would to the fullest extent further the education of the young throughout the country.

"Neither the advocates of the Church Education Society nor the Roman Catholic priesthood will consent to any scheme which does not leave them unfettered in the religious teaching given by them to the children of their respective creeds. If, therefore, their adhesion is to be gained (and without it the benefit conferred upon the country will be much curtailed) no restraint must be laid upon the religious teaching given in the school, provided that an efficient education in matters secular is imparted. If Government would be willing to give aid to every [school] which it was satisfied was giving a sound efficient education to a sufficient number of children, leaving religious instruction entirely in the hands of the patron of the school, I believe that education would receive a wonderful stimulus, and that thousands of children who are receiving a scanty education in schools meagerly supplied with requisites, taught by under-paid and inefficient teachers, would receive a superior education in efficient schools.

"In such places in Ireland as the Protestant population was too small to warrant a grant to a Protestant school, the present Church Education would supply the funds, being relieved from the support of other schools. I do not believe that the same difficulty would be felt with respect to Roman Catholics; in few, if any, parts of Ireland, are they so small in number as not to be entitled to a separate school within the reach of all. In such places a similar provision would be available from funds released from other schools."

8. Rev. Charles Alexander, Rector of Drumcree, county Armagh,
„ J. H. Davidson, of Greyabbey, county Down,
„ J. B. Godfrey, Vicar of Duneane, county Antrim,
„ F. T. Hankin, Incumbent of Clare, county Armagh,
„ L. R. Heron, Incumbent of Charlemont, county Armagh,
„ M. Mulgan, Incumbent of Lisnadill, county Armagh,
„ J. G. Pooler, Incumbent of Newtownards, county Down,
„ W. Reeves, Rector of Tynan, county Armagh,
„ G. Robinson, Rector of Tartaraghan, county Armagh,
„ G. C. Smythe, Vicar of Carmoney, county Antrim,
„ W. Spedding, Vicar of Ballyhalbert, county Down,
„ Ch. Waring, Incumbent of Eglish, county Armagh,

} Concur in describing the mixed system as both beneficial and popular.

9. Rev. E. A. Lyle, Incumbent of Kircubbin, county Down,
„ W. K. Lynar, Rector of Islandmagee, county Antrim,
„ A. Molony, Rector of Ballymore, county Armagh,
„ J. Whiteside, Muckamore, county Antrim,

} Consider the mixed system beneficial, but describe no popular feeling on the subject.

10. Rev. H. C. Groves, D.D., Incumbent of Mullavilly—

"Beneficial, but impracticable, if school is connected with any religious denomination."

11. Rev. J. F. Flavell, Rector of Mullabrack, county Armagh—

"No bad effects among Church and Dissenting children."

12. Rev. C. Falloon, Rector of Ballynure, county Antrim—

"Beneficial among Protestant denominations; popular feeling in favour of National Board; parish Presbyterian."

13. Rev. William Greene, Vicar of Antrim,
„ J. Wrixon, Incumbent of Malone, county Down,

} Beneficial, as exemplified in Church Education Society's schools; scriptural education popular.

14. Rev. R. C. Oulton, Curate of Clonfeacle, county Armagh—

"No reason to believe it not beneficial, but popular feeling against it."

15. Rev. Robert Hannay, Belfast—

"Hostility between religious denominations not in any degree softened by it."

16. Rev. J. Crossley, Incumbent of St. Matthew's, Belfast—

"Not beneficial, and, so far as ascertained, denominational system would be preferred."

17. Rev. R. Oulton, Garrison Chaplain, Belfast—

"Practically, in general, very much against it."

18. Rev. C. Beauclerk, Incumbent of St. Mary's, Belfast,
„ G. A. Chadwick, senior Curate of Belfast,
„ J. Chomley, Rector of Loughgall, county Armagh,
„ A. G. Gilmore, Incumbent of Carrowdore, county Down,
„ J. Marshall, Incumbent of St. Mark's, Ligoniel, county Antrim,
„ J. W. Stokes, Archdeacon of Armagh,
„ A. Wrixon, Curate of Shankhill, county Armagh,

Concur in saying that in effect there is little or no mixed education, or that the denominational system is really at work. The last-named adds his opinion that the popular feeling is rather in favour of denominational schools.

19. Rev. J. H. Deacon, Incumbent of Trinity Church, Belfast—

"No Roman Catholic in my National schools; always some in a Church Education school under my superintendence."

20. Rev. C. Seaver, Belfast—

"Hopeless to expect Protestants and Roman Catholics to attend same school; all other creeds unite."

21. Rev. C. Allen, Incumbent of St. Paul's, Belfast,
„ R. Binney, Incumbent of Bangor, county Down,

"Protestants unite."

22. Rev. A. H. M'Causland, Incumbent of Groomsport, county Down—

"Beneficial to an unscrupulous majority."

23. Two other clergymen of the Established Church who favoured me with written communications expressed no opinion on this subject.

II. From Roman Catholic Clergymen.

1. Rev. J. Canavan, C.C., Belfast—

"I believe it is not beneficial. Instead of causing children and teachers to be tolerant it only trains them to be constantly on the alert to discover each other's shortcomings. I have known teachers in the model school keeping a written register of the misdemeanours of their fellow-teachers. No district in Belfast has been so subject to religious strife as the immediate neighbourhood of the model schools. So far as other schools are concerned, there is here, practically, no mixed system. The greatest advocates of the mixed system do not permit a child to be sent to any school except one in which the patron is of its own denomination.

"As to the popular feeling, Catholics are unanimously, or almost unanimously, against it in theory and in practice; Protestants approve of it in theory, but do not reduce their theory to practice."

2. Rev. P. Kelly, P.P., Keady, county Armagh—

"It is not. Decidedly against it."

3. Rev. Thomas Loyl, P.P., Ballymacnab, county Armagh—

"It is not beneficial, and that's the popular feeling in this neighbourhood."

4. Rev. —— M'Auley, P.P., Kircubbin, county Down—

"I consider the denominational system preferable to the mixed system, and I think Catholics generally entertain the same opinion and consider it a grievance that Ireland is not provided for, in the matter of education, on the same principle as England and her colonies."

5. Rev. W. Martin, Adm., Belfast—

"The system of educating children of different denominations together is not beneficial, unless you would consider the insults and jeers offered to Catholic clergymen by the children attending the model school, Belfast, when going to and returning therefrom, the *results* of a *beneficial education*.

III. From Presbyterian and Protestant Dissenting Clergymen.

(For a communication from the Non-Subscribing Presbytery of Antrim, see Appendix E.)

1. The following forty-six clergymen concur in the opinion, usually expressed with much emphasis, that the mixed system is both beneficial and popular; some of them, however, making an exception with respect to the statements of the Roman Catholics on the subject, viz.:—Revs. Geo. Alley (Wesleyan), Belfast; John Bell (Pres.), Clare; L. E. Berkeley (Pres.), Lurgan; W. Campbell (Pres.), Islandmagee; W. Cather (Wes.), Belfast; J. G. Clarke (Pres.), Lurgan; D. Coote (Pres.), Killylea; W. Craig (Pres.), Conlig; J. Donnelly (Wes.), Portadown; J. Douglas (Baptist), Portadown; M. Getty (Pres.), Ballycarry; W. Graham (Independent), Carrickfergus; Thos. Hamilton (Pres.), Belfast; W. Henry (Pres.), Loughgall; Wm. Johnston (Pres.), Belfast; R. G. Jones (Wes.), Belfast; J. W. M. Kay (Wes.), Belfast (now Dublin); J. M. Killen (Pres.), Comber; J. Y. Killen (Pres.), Duncairn; J. M'Aulay (Pres.), Donaghadee; W. Macaulay (Pres.), Newtownards; J. S. M. Macintosh (Pres.), Belfast; J. Mackenzie (Pres.), Malone; J. Macnaughten (Pres.), Belfast; C. J. M'Alester (Pres.) Holywood; J. M'Alister (Pres.), Armagh; J. Mecredy (Pres.), Belfast; W. Mitchell (Pres.), Ballyblack; H. Moore (Pres.), Newtownards; J. Moran (Pres.), Belmont; W. Orr (Pres.), Kilbride; H. Osborne (Pres.), Holywood; J. Porter (Pres.), Belfast; J. Leslie Porter (Pres.), Assembly's College, Belfast; J. Scott Porter (Pres.), Belfast; H. Price (Wes.), Holywood; H. Stewart (Pres.), Randalstown; H. Stewart (Ref. Pres.), Newtownards; J. Stuart (Pres.); D. Thompson (Prim. Wes.), Belfast; T. Toye (Pres.), Belfast; G. Vance (Wes.), Belfast; T. Watters (Pres.), Newtownards; T. West (Pres.), Antrim; J. M. White (Indep.), Belfast; J. Whiteford (Pres.), Raloo. I select from the communications made to me by the above-named gentlemen the following samples:—

(*a.*) Rev. L. E. Berkeley (Pres.), Lurgan—

"It is highly beneficial—removes prejudices, tends to the cultivation of kindly sentiments and feelings, and is, I believe, liked by the *people* of all denominations. I would regard the introduction of the denominational system as deeply injurious to the best interests of the country, and calculated to mar, perhaps for ages, the peace, prosperity, and enlightenment of Ireland. The Parliament of Great Britain never, in my opinion, conferred so great a boon on this country as the present system of united education. To supersede it even partially by any denominational system would be to reverse the liberal and enlightened policy of the last forty years, to separate the people into hostile camps, and to throw back the country for at least a century. National education is free only when a parent can send his child to any school supported by the State, with the full assurance that in that school there shall be no interference with the religious convictions of that child. The rights of minorities should be carefully guarded by the State, and there are Roman Catholic minorities in the north and Protestant minorities in the south and west which the introduction of denominationalism would oppress. So far as I know the mind of the people here, it is going in the direction of purely secular education rather than have denominationalism."

(*b.*) Rev. William Johnston (Pres.), Belfast—

"The system of educating the children of different denominations together I regard as most beneficial. Party spirit and religious rancour have been the curse of Ireland and the disgrace of Belfast. When the children of different denominations are educated together they are thus led to know and love one another, and personal friendships are thus formed which soften down sectarian animosities and form the bond of brotherhood for after life. In this aspect, I regard the present system of National education in Ireland as the most important boon which the British Government has conferred on Ireland, and to break it up for a denominational system

I would regard as a national calamity. The present system of National education is specially adapted to our divided community, and equitable in its principles and details. It brings the children of various denominations together, it protects the rights of conscience, it secures secular instruction and religious protection for the smallest minorities in any school or district, and, with a first-class education for the child, it gives to the parents and to the clergy all that they can legitimately claim.

"The popular feeling on this subject in Belfast, and I believe throughout the north of Ireland, is strongly in favour of sustaining the present system of National education. The great mass of the working classes gratefully appreciate the education given, and the only obstacles to its complete success are the blind and bigoted sectarian zeal of those Episcopalian clergy and the Roman Catholic priests, who put forth their powers to withdraw those children they can influence by personal visitation, misstatements, bribes, and intimidation from the National schools."

(*c.*) Rev. J. W. M. Kay (Wes.)—

"It is beneficial, and the popular feeling is in its favour. Indeed, in any cases where I have known objections, they have arisen from suggestions of the clergy rather than from the feeling of the people. Looked at in this light, denominational patronage has worked injuriously, multiplying small schools, occasioning very frequently an unhealthy rivalry, inducing scholars to stay or go by remitting or lowering fees in one school and another, and thus having a large class of almost pauper teachers, with an encouraged tendency towards pauper education. I am persuaded that if there were fewer schools, affording better accommodation, constituted strictly after the model schools, the Government taking the responsibility of *prescribing* and *giving*, through teachers of its own selection, secular education, affording at the same time freedom and facility for religious instruction, it would be of inestimable advantage to this country, and the work of education would not only be much more thoroughly, but in the end more cheaply done."

(*d.*) Rev. J. M. White (Indep.), Belfast—
